

"Bioethics Commission Failed Obama's Mandate in New Report"

[Mind Justice Home Page](#)

by Cheryl Welsh, January 2012

President Obama directed his Presidential Commission for the Study of Bioethical Issues (Commission) to review human subject protections to "determine if Federal regulations and international standards adequately guard the health and well-being of participants in scientific studies supported by the Federal Government." Obama ordered the report last year in response to revelations that in the 1940s, the U.S. Public Health Service conducted unethical research on human subjects without their consent. U.S. researchers intentionally infected over 1,500 human subjects in Guatemala with sexually transmitted diseases. The Commission issued a report last December 14th and concluded that current U.S. rules are adequate and would prevent such abuses from happening again.

However, the Commission disregarded the lack of legal reforms for nearly half a million victims of unethical Cold War government research. The Cold War research was often conducted in secret and without consent. The ethical consensus today is that a person must agree to participate in any research and must be informed about the possible risks, known as informed consent. But bureaucratic roadblocks prevented crucial legal reforms from being implemented, including the requirement of informed consent in classified research. Today, U.S. law still allows for a waiver of informed consent.

The Commission report should have recommended an informed consent requirement for classified research but did not. Instead, the report's central finding was that "the U.S. system provides substantial protections for the health, rights, and welfare of research subjects." In failing its mandate, the Commission has put the public at risk for further unethical experiments in classified research. Significantly, the number of Cold War victims far surpassed the total number of victims of unclassified research, as in Guatemala, making the Commission's failed mandate even more egregious shocking and inexcusable.

Between 1940 and 1974, Americans were used in military-related Cold War experiments involving radiation, blister and nerve agents, biological agents, LSD, and more. The story made headline news in the early 1990s and the public was outraged. Another presidential panel, the Advisory Committee for Human Radiation Experiments (ACHRE) issued a 1995 report on the Cold War research and stated that the federal government was "blameworthy for not having had policies and practices in place to protect the rights and interests of human subjects." The ACHRE recommended two special rules to protect human subjects in classified research; an absolute informed consent requirement, and an independent review panel that must approve any classified research.

A 1997 memorandum issued by then President Clinton included both the ACHRE recommendation to prohibit a waiver of informed consent in classified research, and also a modification of the ACHRE's second special rule. But the Clinton memorandum was never implemented. Despite reform efforts, since 1991, the federal regulations for the protection of human subjects have remained unchanged. The regulations are popularly known as the Common Rule, and cover both classified and unclassified research.

The Common Rule is found at 45 U.S. Code of Federal Regulations (CFR) 46. CFR 46.101(i) allows a director of a federal department or intelligence agency to waive any of the Common Rule requirements, including the informed consent requirement and to do so in secret. The waiver effectively nullifies the regulations, and as happened in past Cold War experiments, allows for a complete lack of protections for human subjects in classified research, at the discretion of top officials.

The endnotes of Obama's Commission report briefly mentioned the current rules that cover classified research; an Institutional Review Board (IRB) must include a nongovernmental member and must review classified research, and expedited review is not allowed. However, without the consent requirement, U.S.

rules still fail to meet even the minimal standards for adequate human subject protections today.

Nonconsensual human experimentation is a violation of the Fourth, Fifth and Eighth Amendments of the U.S. Constitution. The U.S. government has acknowledged as much in a U.S. Department of State report and past presidential commission reports. Today, human subjects have the constitutional right to informed consent but they don't have the necessary tools—a rule or statute—to exercise that right.

The ethical consensus for the informed consent requirement and the constitutional right to be free from nonconsensual experiments provide a solid foundation for long overdue reforms. Additionally, the ACHRE special rules and Clinton's memorandum support that informed consent in classified research is sound public policy.

It is true, most experts believe that the ethical standards and U.S. rules in place today would prevent the large numbers of Cold War experiments from happening again. While that may have been the thinking of the Commission, this disregards the overwhelming evidence that the legal requirement of informed consent in classified research is essential for adequate human subject protections.

Obama will now act on the Commission report and public opinion can make a difference. Let's ask Obama to finish what Clinton started and give human subjects the legal tools to ensure substantial protections, a U.S. rule or statute that requires informed consent in classified research.

Chapters Summarized

Introduction

This book is a description of the history and known facts of electromagnetic and neurological technology, within the framework of classified nonconsensual government experimentation. It is presented as a list of footnotes with brief commentary. It explains how the government, in particular the United States and the former Soviet Union have engineered science into a technology in order to target and control the mind and body for political and military purposes.

[Contents](#)

Chapter One

Email from Physician For Human Rights on cancellation of a human rights statistics project for mind control victims citing "fear for my family".

[Contents](#)

Chapter Two

A 1983 Defense & Foreign Affairs article by the editor Dr. Stefan Possony on Soviet-US mind control technology. A good summary of the "big picture."

[Contents](#)

Chapter Three

Jonathan Tennenbaum describes development of Soviet electromagnetic weapons and the physics and biology behind the weapons. He gives clear, concise explanations which can be verified with the current level of scientific knowledge. There are also excerpts from several articles.

[Contents](#)

Chapter Four

This is a list of what scientists are saying about brain research. It describes the physics, engineering and biology that is needed to develop mind control technology. This will explain what scientist believe it takes to decode the brain and the level of neurological research today. Will Russian and U.S. scientists develop neurological weapons on people or animals? This chapter logically and factually supports allegations by victims that brain functions and every nerve of the body can be controlled remotely with current technology.

[Contents](#)

Chapter Five

Korean brainwashing of the 1950s is briefly described. this is a turning point in the history of mind control. A few sample articles demonstrate that there was a pronounced political will to support a massive effort to control man before the Russians do, to solve the mysteries of the brain for military purposes.

[Contents](#)

Chapter Six

The history of science and military, corporations and government involvement from the 1940s up to today. There was a massive, classified military research effort to fight the cold war. There are many excerpts listed in support the fact that mind control technology could be developed out of the public eye and with the support of top officials. The top scientists of the nation work in teams to solve specific problems, such as the government Killian Panel, the Cybernetics Group, RAND, the secretive non-governmental Institute for Defense Analysis and it's JASON Group and the Golden Fleece and the Brain Research Institute. Examples are given of eminent scientists with government funding for research related to decoding the brain.

[Contents](#)

Chapter Seven

This is an interesting and well-documented history of sensors technology, highly classified and billions of tax dollars spent on its development during the Vietnam War. The U.S. military and corporations then sell this technology to Europe. There are many articles listed here which describe the importance and funding of bionics, replacing man with electronic eyes and ears. This is the foundation for a bureaucracy to distribute mind control technology throughout the world.

[Contents](#)

Chapter Eight

This chapter describes the targeting of whole populations with electromagnetic mind control. Top government officials state unequivocally that it can be developed and there have been many rumors over the years, reported in major newspapers. The goal of controlling man for political purposes continues. Here are a few of the many examples.

[Contents](#)

Chapter Nine

This chapter states what the brain code is in general terms. This is a summary of the Soviet discovery of the genetic code of the brain, how the U.S. surpassed the Soviets and the pioneers of this amazing history. Government mind control technology has been developed, is firmly in place today and is in the plans for the future. It is important to match the description of victim's allegations to the mind control technology so that they may find a timely solution.

Editor's note. Some chapters are long, over 20 pages and include the original material because of their importance and for documentation. **The main points of this book are highlighted and arranged with headings so that it may be skimmed.**

[Contents](#)

Introduction

This book came about as a result of research for alleged victims of mind control experimentation. Illegal experimentation using electromagnetic weapons technology on U.S. citizens has been going on throughout the cold war, continues today and is in use as an intelligence tool and military weapon today. Please see CAHRA website for background information. **This book goes to the roots of the problem.** It is a beginning and establishes the who, what, why, when and where behind mind control technology. This book will put together important facts that unfortunately, the U.S. government will never admit until they are caught. The evidence is growing. It will be up to the reader to put the facts together.

This book will show that **scientists, governments and the military were and are interested in finding the key to human consciousness.** The military would like to have ultimate control over humans. Scientists would like to find the scientific basis for consciousness. Victims of government experimentation, who can verify the sophistication of the technology know that signals of the brain can be remotely read, decoded and that simulated brain signals can also be sent to the victim. **This book is a start on the path to describe the scientific basis of the technology** used to destroy unwitting victims of mind control experiments. I hope that this will stimulate further research.

Most scientists agree that to find the brain code would be a tremendous undertaking, like the Manhattan Project to develop the bomb, the space program to go to the moon or the gene mapping program. Funding and scientific coordination is required for projects such as this. In the 1940s, both Russia and the United States were very interested in this topic. And if there were a mind control arms race, as indicated by several independent documents, the political will would necessitate a mind control "Manhattan Project". **This book will present the basic scientific theory of the brain code as described by scientists. And it will give examples of the development of this technology and how it could be hidden from the U.S. public.**

Many historical facts make sense in light of this hypothesis. Why has the United States denied the "nonthermal" theory of electromagnetic effects on biological organisms and yet the Russian scientific literature documents this fact going back to the 1920s? Why is there a documented history of electromagnetic politics that leads to a U.S. cover up beginning in the 1940s? A large military project to use electromagnetic technology for military and political purposes would be a logical explanation.

This history is barely beginning to be told. There have been rumors for years. When the information is finally declassified, it will be an amazing and tragic history. There is hope that a scientist who knows of this classified situation will share this information. In a similar way, the leaked confidential tobacco company papers by the tobacco employee was a heroic act and will save many children's lives eventually, as the tobacco companies are made to change their ways. As a gesture to humanity and to save thousands of alleged victims of nonconsensual electromagnetic and neurological experimentation, this could begin the process of dismantling the cold war thinking that has allowed horrific radiation experimentation and now mind control experiments.

This book starts with a small but powerful example and proves that while the best evidence is still classified, there is still proof that the U.S. government is conducting mind control experiments and using the technology without consent of the target.

Next, this book will present a few representative articles written by **well-known scientists and professionals on mind control and electromagnetic technology**. The first article is by a Hoover Institute Fellow, Dr. Possony. It is a good overview of the whole situation. There will then be excerpts from articles on solitons and their role in mind control technology on a quantum level.

Next there will be excerpts from papers by Jonathan Tennenbaum, editor of Fusion magazine. **There are clear physics and biological descriptions of the mind control weapons which have been developed by the Russians.** The history of this development is described and excellent footnotes for further reading are included. Other sources verify the premise that the Soviets have developed mind control technology since at least the 1940s.

The next section includes excerpts from several articles and demonstrate the interest in **electromagnetic technology and the brain by scientists and the military for over 50 years**. Other articles will show that the brain's electromagnetic signals can be remotely detected by **SQUID. There will be current articles in support of the fact that science has decoded the brain signals so that direct communication with the brain is possible.** While it is true that this is highly classified, there are still strong indications of this fact. Classification has been used to cover up radiation experiments and even though there was proof, for various reasons, it was ignored. Again, history is repeating for mind control victims. It is important to note that the highly technical and sophisticated electromagnetic technology which is briefly described in this section, matches the symptoms that victims have described and documented.

This short section describes the Korean brainwashing scare of the 1950s and how much scientific effort and money was put into behavior control experiments by the CIA. This event would provide the political will necessary to fund mind control research and to start the search to find out how the Russians were brainwashing Korean soldiers and find the antidote. **The search for the decoding the brain intensified in the 1950s as several article will demonstrate.**

The following section describes the U.S. government during the 1940s through the present time. The classification, the cold war mentality, the scientists and their interest in brain research is well-illustrated from several different sources. There are many research leads to follow. **The science and government relationship that exploded during World War II has had an effect on this problem and will be briefly mentioned.** The funding of scientists and **how scientists worked in elite groups** such as RAND corporation and the Jansons Group, a part of the Institute for Defense Analysis is described. Out of the public eye, there was no accountability and no public input. A few examples of problems are described.

There is a large section on the development of sensors technology because it **explains so well how the military has worked with scientists. The Electronic Battlefield by Paul Dickson** is one of the few books which portrays the negative side of the military and supports his claims with many footnotes. **There are many ideas on how to work on mind control technology issues that can be found in this book.**

The newspaper articles on electromagnetic technology which can be broadcast over populations for warfare and psychoactive effects will be listed with excerpts. The numerous citations and excerpts are listed in order **to answer the question of how the government could technically do this and to show that the government was interested in this technology in order to fight the cold war.**

The U.S. government has decoded the brain. This is important to know about because there are allegations of abuse and there is no accountability or public input. Until someone stops the U.S. government, the problem will continue to get worse. The number of victims of government experimentation is increasing. And all of the experts say that electromagnetic weapons are as serious as the atomic bomb(see CAHRA website, nonlethal weapons.) The warnings are there.

This problem has been around for years and it is highly classified but that does not mean it doesn't exist. **The many excerpts from several independent sources are adding up to the same conclusion.** There is nonconsensual government electromagnetic experimentation and it is a tragedy that needs to be dealt with. On a more hopeful note, this article can prove that the mislabel of mental illness, which most victims have endured, is a thing of the past. There is too much evidence now. That is why it is important to keep researching, so that it will never happen again.

[Contents](#)

Chapter One

There is a problem. Here is one example of irrefutable proof.

An email **from a physician from the group Physicians for Human Rights** is convincing evidence of the seriousness of this problem. It is one of the common replies received by victims. This doctor wrote on biological warfare and was very active in human rights issues. When asked to write a medical report on allegations by victims of electromagnetic weapons testing experimentation this was the reply on March 10, 1997.

"...After a lot of consideration, I've decided that I cannot undertake this project. **I have a family, and feel unable to subject them to any risks that might result because of my involvement.**"

[Contents](#)

Chapter Two

The following important article was written by one of **"the greatest strategic philosophers of the 20th Century"**, founder of International Strategic Studies Association, former member of Mankind Research Unlimited and former psychological warfare expert with the Office of Naval Research. **Dr. Possony stated that mind control is feasible and militarily important.** The article is a good overview of the Soviet-U.S. race to develop mind control technology and a precise explanation for why there is illegal experimentation going on to this day. Here is the entire article, with its many research leads.

Possony, Stefan.(1983,July). **Scientific Advances Hold Dramatic Prospects for Psy-Strat.** Defense & Foreign Affairs. P.34.

Associate Editor Dr. Stefan Possony discusses how scientists are facing the prospect of messaging directly into a target mind. Whither psy-war?

The history of psyops technology is about 200 years old, and it will continue to progress. Hence it is most important to look into the future. It is no longer really difficult to send messages to the targets; that is, the persons who are to be influenced. The target cannot be reached if he is not interested in the originator, nor in his message, or if his interest is perfunctory. He is unattainable also if he is bored, and if he finds it more pleasurable to listen to competitors, who are multiplying.

The target cannot be persuaded to listen. It is the other way around; he may listen if he already is fully or partially persuaded, and if the program is attractive in addition to informative, and if it helps him in his activities.

Psyops technology is more or less in hand. Its better utilization is at present precluded in most instances by political ineptitude and by international opposition. The importance of better programming is recognized as a theory, but new ideas and fundamental improvements are rare. Hence success often is a matter of hit or miss. At this point, let us forget about history and current events, and let us resolutely turn to the future; I want to alert you that psyops technology may advance from communicating to direct signaling. Some

developments in this regard are already taking place.

X-rays and gamma rays are located at the upper end portion of the electromagnetic energy frequency spectrum. What is at the lower end? The most important of all of nature's phenomena.

Suppose it becomes feasible to affect brain cells by low frequency waves or beams, thereby altering psychological states, and making it possible to transmit suggestions and commands directly into the brain.

Who is so rash as to doubt that technological breakthroughs of this general type would not be put promptly to psyops use? More importantly who would seriously assume that such a technology would not be deployed to accomplish political and military surprise?

A few years ago there was much excitement about the Soviet microwave "bombardment" of the US Embassy in Moscow. Why did the KGB, then under Yuri Andropov's leadership, embark on this seemingly scurrilous -- and very prolonged -- effort? There was no answer to this question, except that the KGB must have wished to harass US diplomats and cause them to worry about their health. this theory was never convincing.

The question was raised **whether the Soviets had discovered a technique of using microwaves for psychological purposes**, and whether they were experimenting with this technique on US specialists on the USSR, unwittingly pressed into Soviet service as guinea pigs.

Impossible, **replied the State Department, the waves cannot break through the blood-brain barrier**, and thermal effects are so negligible that the body would not be affected. Nevertheless, embassy personnel were indemnified for health damage.

By 1979, at the latest, it was known that electromagnetic fields raising body temperatures less than .1 degrees Celsius may result in somatic changes. It was most surprising that such a trivial temperature rise was having any effects, and even more astonishing that those effects were significant.

Chemical, physiological and behavioral changes can occur within "windows" of frequency and energy continua. One of those windows is connected with navigation in marine vertebrates and with biological rhythms of humans. Another is at the level of the human electroencephalogram (EEG), which is in the range of extremely low radio and sound waves, around 20 Hertz.

Those findings remain unexplained. they seemed to require energy amplification of the initial stimulus by some 12 orders of magnitude. No such amplification was deemed to be feasible, and none was discovered.

Let us cut the story to the minimum. The original model, according to which the blood-brain barrier cannot be broken, was derived from **the axiom that electromagnetic waves interact with tissue in a linear manner. However, it turned out that the molecular vibrations caused by a stimulating extracellular electromagnetic field are non-linear.** Utterly unexpectedly, they take the form of soliton waves which can transfer energy along long molecular chains.

By 1982 the term "soliton" finally made it to the technical dictionaries. Here is a definition from the 1982 McGraw-Hill scientific-technical dictionary: "A soliton wave...propagates without dispersing its energy over larger and larger regions of space." As I understand it, it would be more correct to say: "A soliton wave propagates suddenly acquired energy, or energy imparted by shock, without dispersing it."

Significance? Extracellular disturbances such as acoustic or electromagnetic bursts can be propagated across the cell membrane. In this, non-linearities in molecular dynamics rather than chemical kinetics are the key. Put differently, the 12-magnitude energy deficit is overcome, not by brute force, but by the formation of solitons.

Visualize the brain and its environment as structures of waves, and assume that shock waves create solitons. Then imagine that modern electronics with their flexibility, accuracy and speed are put to work.

In addition, the range of resonances probably will be increased. Hence many frequencies, and several options for the transmission of energy across the membranes of brain cells may become available. **This may imply that the brain cells will be reachable diversely and flexibly, and perhaps routinely.**

The discovery of cross-membrane coupling may be compared to the discovery of oxygen in 1772, which

allowed the proof that phlogiston, the supposed element of fire, does not exist. Once the phlogiston idea was buried, chemistry and the chemical industry began their triumphal march across the world.

The exploration of the cross-membrane phenomenon is only at the beginning, and it is not yet possible to anticipate practical applications. As of now a new phenomenon has been discovered, probably. **Nothing is as yet known or is known publicly, on how the soliton can be aimed to produce desired effects. Only a hypothesis can be stated: If the phenomenon can be utilized, this will in due time have crucial bearing both on the body and on the brain, and on defense.**

The theory of cross-coupling was formulated by A.S. Davydov who, it seems, published the first purely theoretical version in 1976, and followed this up with a study on "Solitons as energy carriers in biological systems". By 1979 Davydov appeared to be linked to the Ukrainian Academy of Science.

It should be noted **that Russian mathematicians were concerned with solitons before US scientists ever got interested.** It is therefore conceivable that Davydov achieved his results long before publication, and also that the experiments which involved the US Embassy, produced findings which led to subsequent progress.

In the US, the pioneering work seems to have been done by Albert F. Lawrence and w. Ross Adey, writing in Neurological research, Volume 4, 1982. the Max Planck Institute for Biochemistry in Munich also discovered that cell membranes can be crossed. Eberhard Neumann and Guenther Gerisch found that a shock wave passing through an electric field may create ultra-quick processes within the membrane, and that through such "jumps in the field" (Feldsprünge: this probably means solitons) genes can be transmitted and cells fused.

There is a differential in the tension of the inner and outer membrane which averages 1/70,000 of a volt. This corresponds to 70,000 volts per(theoretical) membrane thickness of one centimeter.(The real thickness of a membrane is 0.1-8 centimeter.)

The discovery was made unexpectedly in the course of research on electric fields in membranes and their impact on vital processes. This research requires measurements of events lasting not more than one nano-second(one billionth of a second), and it suggested that solitons generally increase the permeability of membranes. Thus, new perspectives on genetic "engineering" were suddenly opened. Moreover, it was possible to fuse no less than 50 cells into one supercell with 50 nuclei and one single membrane. We might as well forego assessing this monstrous novelty.

The Max Planck Institute broke into the membrane, so to speak, either without knowing about Davydov, Lawrence and Adey, or after learning about them while pursuing a different goal. In either event, a fundamental innovation, a breakthrough discovery or invention will be made several times, at different places, and be persons working independently from one another.

It is futile to speculate on who stands where in a race which has barely begun. But it can be postulated that the USSR probably has an ambitious research program, whereas in the US, while work is being done, no program --let alone a crash program--is in existence.

It is predictable that in the wake of Andropov's upgrading of psyops, the relevant programs in the USSR will be given an early and powerful boost.

Future psyops will have to be planned for perspectives which cannot be formulated before the US embarks on a major and totally novel research and development program. Meanwhile, it must be assumed that psyops will grow world wide, in strategic importance and in new forms.

The following report appeared in "Defense & Foreign Affairs Daily" on June 7, 1983:

On May 20, 1983 US newspapers printed an Associated Press story from the Veterans Hospital at Loma Linda, California that the Soviets developed a device, called Lida, to bombard human brains with radio waves. The radio beams are expected to serve as a substitute tranquilizers, and to treat sleeplessness, hypertension, and neurotic disturbances.

It is not yet determined whether Lida affects the immune and endocrine systems. Lida is reported to change behavior in animals. At the present, the device is on loan to Dr. Ross Adey, chief of research at Loma Linda. Adey started testing the machine three months ago, and hopes to complete his investigations within a year.

According to Dr. Adey, who repeatedly visited the USSR, the Soviets have used the machine on people since at least 1960. The machine is technically described as "a distant pulse treatment apparatus". It generates 40 megahertz radio waves which stimulate the brain's electromagnetic activity at substantially lower frequencies.

Dr. Adey was quoted as saying: "Some people theorize that the Soviets may be using an advanced version of the machine clandestinely to seek a change in behavior in the United States through signals beamed from the USSR." No reference was made to the protracted microwaves bombardment several years ago of the US Embassy in Moscow.

On April 29, 1983, Associate Editor Dr. Stefan Possony, addressing the Defense 83 meeting sponsored by Defense & Foreign Affairs, reported on Dr. Adey's work and on the work by Dr. A.S. Davydov of the Ukrainian Academy of Sciences. Davydov discovered how the blood-brain barrier can be penetrated by low frequency beams and directly affect cells in the brain. Possony's remarks were delivered to a panel studying psychological warfare. [Part of that paper is printed below--Ed.]

In the US research on direct brain waves has scarcely begun, and the USSR has a lead of approximately 25 years. Once it is matured the new technology will be extraordinarily significant in medicine. It also may have major impacts on communications, intelligence, and psychological operations, and permit deliberate physiological impairment.

The KGB is known to be interested in the program. It is not known whether the US and other Governments are trying to determine whether their countries have become targets of clandestine brain waves beamed from the USSR. Nor are there indications that work on countermeasures is being contemplated, except perhaps in the USSR.

[Contents](#)

Solitons

Editor's note. Most people have not heard of solitons. But, Dr. Possony is not the only professional discussing solitons and mind control. Here are excerpts from books and journals to give an overview of biological nonlinear effects and solitons.

No author. (1979, October 27). You Cannot Be a Twentieth-Century Man Without Maths. Economist. Pg. 107.

"Fortunately for pure scientist, most of the problems of basic physics and chemistry either are (or can be adequately handled as) linear problems. **It is only in modern science--in particular, in quantum physics and gravity--that non-linearities loom large. ...The big news in maths is that there are recent developments which promise to make the solving of such non-linear problems possible. ...One development concerns things called solitons.** ..So the equations of solitons are being applied to the fields surrounding subatomic particles. A whole group of elementary particles. A whole group of elementary particles may have been missed by the existing theories. Solitons may also help to understand the force of gravity, which also behaves in a non-linear way. Although Einstein's theory of relativity was a breakthrough in understanding gravity, there is still much to be learnt about this force. Solitons are also being used in research on climate, electronic circuits, fusion power, **nerve conduction, optical materials, superconductors** and a range of other engineering problems."

Remoissenet, M. 1996. Waves called solitons: Concepts and experiments, 2nd ed. Springer-Verlag.

"Preface to Second Edition. ...Chapter 1 was expanded by a discussion of the discovery of solitons in the field of electromagnetic waves and optics.

P. 1. "Basic Concepts and the Discovery of Solitons. "Today, **many scientists see nonlinear science as the most important frontier for the fundamental understanding of Nature. The soliton concept is now firmly established after a gestation period of about one hundred and fifty years. Since then, different kinds of solitons have been observed experimentally in various real systems, and today they have captured the imagination of scientist in most physical discipline. They are widely accepted as a structural basis for viewing and understanding the dynamic behavior of complex nonlinear systems.**"

Infeld, Eryk & Rowlands, George. 1990. Nonlinear waves, solitons and chaos. Press Syndicate of U Cambridge.

p.5. "5. A theory that relies on the interaction of a small number of periodic modes also exists see Infeld (1981c). Solitons are special wave pulses which interact with one another so as to keep their basic identity and so that they act as particles. Now the soliton has come of age in its mother subject, though in the meantime promising to be a useful concept in many other effects. One of the first detailed experimental verifications of soliton type behaviour was in the study of nonlinear ion acoustic waves.

"**Davydov**(1968),(1985) has applied some of the rules of solid state physics to the transport of energy down protein chains. He has shown that the idea of soliton propagation is essential to a study of chemical changes taking place in long protein molecules. This leads to the transfer of ATP (adenosine triphosphate) and could be the basis for an understanding of muscle contraction. **Though much may still remain to be done in molecular biological problems it seems likely that the concept of a soliton will remain the cornerstone of any future theory.**"

Chapter -Three

In two articles, Jonathan Tennenbaum describes development of Soviet electromagnetic weapons and the physics and biology behind the weapons. Following the quite long Tennenbaum articles, there are several articles on the soviet development of electromagnetic and neurological technology. It is difficult to get information on this topic and to know what is going on but over a long period of time, the same facts are repeated and therefore become more verifiable and believable. For over 25 articles on Russian mind control see U.S. Human Rights Report Flatlands Publishing Ft. Bragg(707) 964 8326. It is not easy to see which is disinformation, as there certainly must be on this topic. **But these are several independent sources over several decades, stating much the same theme.** And the science and military implications of electromagnetic technology are by now well established.

Electromagnetic-Effect Weapons: The Technology and the Strategic Implications. Wiesbaden Federal Republic of Germany Jan. 16, 1988. **Executive Intelligence Review.(Executive Intelligence Review Special Report.** 317 Pennsylvania Ave. S.E., 2nd Floor. Washington, DC 20003 (202) 544-7010. Pg. 7. Michael Liebig. ..."This Special Report is meant to sketch the gestalt of this newly emerging Soviet threat, the dimensions of which the Western public is most dangerously unaware. There is barely any understanding in the West of the revolutionary transformations in technology and strategy associated with electromagnetic effect weapons."

Tennenbaum, Jonathan.(1988, Feb). Some ABCs of Electromagnetic Anti-Personnel Weapons. Executive Intelligence Review.Executive Intelligence Review Special Report. 317 Pennsylvania Ave.

S.E., 2nd Floor. Washington, DC 20003 (202) 544-7010. Pg. 9.

Dr. Jonathan Tennenbaum is on the Board of Directors of Fusions-Energie-Forum in the Federal Republic of Germany, and an editor of its magazine, Fusion.

"Often referred to by the misleading name, "radio-frequency weapons," The most sophisticated new type of anti-personnel weapons now being perfected by the USSR for use by its Spetsnaz and regular forces, uses pulses of electromagnetic energy to disorient, paralyze, and kill human targets. Such electromagnetic pulse (EP) weapons can take a variety of forms, including the following: ...

Electromagnetic pulse anti-personnel weapons have many scientific and technical features in common with the laser weapons under development in the American and Soviet anti-missile defense programs. Both use electromagnetic radiation, **propagating at 300,000 kilometers per second**, to achieve their destructive effect. Both require compact power sources, generators of electromagnetic radiation (e.g., **lasers, magnetrons, gyrotrons, etc.**), **beam radiator and focusing apparatus (e.g., optics for lasers, wave guides and phased-array antennas for microwave weapons)**, and **computerized control systems** In both cases also, the maximum effect of these weapons is obtained by "tuning" or "tailoring" the output to the characteristics of the target.

The chief peculiarity of EP anti-personnel weapons lies in their exploitation of highly non-linear effects of electromagnetic radiation upon living organisms. Typically, these weapons employ complicated pulse shapes and pulse trains, involving several frequencies and modulations which can range over a wide spectrum from extremely low frequencies (ELF) into the hundred gigahertz range. Thus, although state-of-the-art technology permits construction of mobile systems of extremely high output power (up to 10 megawatts average power, peak pulsed powers of many gigawatts), it is not the high power per se which determines the lethality of the system, but rather its ability to "couple" the output effectively into the target and to exploit non-linear biological action. While high output power may be used to obtain range and breadth of effects and penetration into enclosures and defenses, the minimum lethal "dose" on target will typically be orders of magnitude less than that which would be required to kill by mere heating, in the manner of a microwave oven.

The closest analogy to a sophisticated EP anti-personnel weapon is provided by powerful chemical weapons, such as nerve gases having rapid, fatal effects at extremely low concentration. In the latter case, the effect is mediated by molecules which enter nerve synapses and other critical areas and disrupt normal functions without massive destruction of tissue. The poison acts on the higher levels of organization of living process. Furthermore, it should be understood that molecules themselves are nothing but electromagnetic configurations. That is, the molecules (e.g., of the nerve gas) **act via electromagnetic fields, by exchange of electromagnetic energy with other molecules. Hence, it should hardly be surprising to discover that the same effects can be induced by electromagnetic radiation alone-without the presence of the molecules! In principle it suffices to identify the precise geometrical characteristics of the electromagnetic action associated with the given substance, and then just "mimic" the molecular action by a carefully "tailored" signal.** Once this principle is understood, **biophysical research can define the most appropriate pulse forms for weapon applications**, independently of any specific chemical "model." **That this is by no means a mere theoretical possibility is proven by a wide variety of experiments on the biological effects of "tailored" electromagnetic radiation, carried out in the West and East over the last 40 years. For obvious reasons, experiments involving lethal effects are mostly classified. To illustrate some of the relevant research areas, we present a couple of examples of well-documented non-lethal effects.**

Since the 1950s much scientific attention has been paid, in the East and West, to effects on the brain of 1) psychotropic drugs (LSD, depressants, stimulants, etc.) and 2) electrical stimulation of specific areas of the brain by implanted electrodes. Among other things, experiments showed that minute currents induced by electrical stimulation could evoke profound changes in brain function, similar to those obtained by psychotropic drugs, the latter often at extremely low concentrations. **This work reveal some "deep secrets" of the physiological organization of the brain, secrets having potentially far-reaching military implications. Since the early 1970s a number of published experiments have shown that similar, profound neurological effects can be induced without the "substantial" intervention of drugs or electrodes, by electromagnetic fields applied from outside the experimental subject. Typical of these are those of Dr. Jose Delgado and Dr. Ross Adey.** Delgado applied a slowly modulated weak magnetic field (several Gauss, pulsed at less than 100 Hz) to the heads of monkeys via external coils. Depending upon the precise modulation frequency used, specific effects were induced. Thus, one frequency caused the animals to fall asleep, and another triggered aggression, each time with very specific

neurophysiological effects on specific areas of the brain. Adey and others have obtained similar neurophysiological effects with a modulated, low-power, radio-frequency field, with modulation frequencies in the range of the internal "brain waves" (EEG). Absorbed power levels were very low- on the order of a thousandth of a watt per square centimeter.

Related experiments have shown that internal EEG waves can be entrained and modified, demonstrating the possibility of direct information transfer to the brain via modulated radio-frequency (RF) fields. Thus, below the threshold of lethal effects, a certain potential for subtle psychological manipulation by means of "tailored" electromagnetic signals cannot be excluded.

Lethal effects have been obtained at power levels not very much higher than in behavior modification experiments. Again, it is not so much the net power **as the exact form of the applied series of pulses, which makes the difference**. One laboratory device, used in brain research, kills experimental animals with a single microwave pulse of 1/6 second duration.

While the neurological effects of modulated RF and microwave radiation have long been a high-priority area for Soviet research, this field has tended to be played down or even suppressed in the West. **For example, Delgado's magnetic field experiments have gone nearly unnoticed in the Western scientific literature, but are a featured subject in a recent Russian book**, published under the auspices of Znanyia, a cadre organization headed by top Soviet military scientist N.D. Basov.

While we have concentrated here on the brain as a key target of EP weapons, this is by no means the only target. The central nervous system more generally, and vital organs, especially the heart, are all possible targets. Moreover, a very insidious deployment of EP would be to degrade the overall health of persons in a certain area by long-term, low-level irradiation. There is evidence that the latter has already been tried by the Soviets in a number of cases.

Much more could be said about non-linear biological effects exploitable by EP weapons. In this short introduction, however, **we want to move on to another key problem of these weapons; how to generate and deliver the destructive action to the target.**

This Special Report presents some details on high-power RF and microwave generators, an area of highest priority in Soviet research and development. There are two essential types of devices which can be used in EP weapons; **oscillators using beams of electrons or plasmas, and solid-state devices.**

Solid state radar, whose development is driven by the needs of military aircraft and missiles, is one of the fastest advancing areas of electronic technology today. Although solid state devices do not (yet!) reach the very high powers attained by electron beam devices, miniaturization makes it possible to build today complete, **highly sophisticated phased-array radars of suitcase-size, with several kilowatts of average output. The principal advantage of this technology is that it permits extremely sophisticated "tailoring" of pulse shape in space and time, in a compact system, with direct coupling to high-speed computers. This is exactly what is needed in order to optimally exploit non-linear biological effects.** What is lost in brute power is thus gained in efficiency.

Recent breakthroughs in what is **called "high-temperature superconductivity" open up the perspective that both types of EP generation technology--electron beam as well as solid state--are going to undergo revolutionary improvements in the years immediately ahead. The impact of this revolution cannot even be estimated at this time, but it will certainly mean radical reductions in the size of devices having a given electromagnetic "firepower".**

As our discussion of biological effects already indicated, electromagnetic anti-personnel weapons depend essentially on "tuning" the output signal to the target. This goes not only for the frequency and amplitude of the signal, but for its entire space-time "shape." Figure 6, for example, is drawn from thermographs of models of the human body irradiated by RF radiation of the same frequency, but with field geometries. These and other experiments demonstrate, that the areas of maximum absorption of electromagnetic energy inside the body depend on the geometry of the incident wave. By choosing the right geometry, the energy can be focused into any desired area, such as the brain.

A sophisticated EP weapon must thus be able to project a specific geometry of electromagnetic field onto a distant object, over a given terrain and in given surroundings. Without going into technical details of waveguides and various antenna types, we shall briefly present one of the relevant techniques: the principle of the phased array.

A phased-array antenna consists of an assemblage of many individually controlled emitting (or receiving) elements, placed in a fixed geometrical arrangement. The output field of the array is the sum of the waves emitted by the individual elements. By electronically controlling the relative phases of these individual signals, the output field can be given any desired "shape" and direction, limited only by the wavelength used, the number of elements and the size of the array. The huge soviet ABM radar at Krasnoyarsk, for example, contains an 83-meter diameter phased array of thousands of elements. The output can consist of a single, very narrow beam, or hundreds of independently directed beams, all depending on the "phasing" of the elements. This radar can track large numbers of missiles simultaneously, without any mechanical motion of the antenna.

The functioning of phased-array antennae is thus closely related to holography, or three-dimensional photography. In a hologram, a photographic plate records interference patterns, corresponding to the phase relationships of laser light reflected from the object. When the holographic plate is illuminated by a laser, the phase relationships are "reconstituted" and the viewer has the impression of seeing a three dimensional object.

The ensemble of elements of a phased-array antenna takes the place of the holographic plate, but at a much longer wavelength than visible light (centimeters and millimeters instead of fractions of a micrometer). When operated in a receiving mode, the phased array obtains much more information than an ordinary antenna; like the hologram, it measures entire electromagnetic **field geometries, not merely a one-dimensional, electromagnetic "signal"**

The holographic principle underlying phased-array systems points to a potentiality for creating any desired three-dimensional, electromagnetic field distribution around a target object, from a distance, correcting for reflections, obstacles and other interference. Moreover, the field can be transformed and shifted from one location to another in space within a fraction of a second. Thus, an ideal EP-weapon could attack many individual targets, simultaneously or in rapid succession. One or more phased arrays would be used in receiving and transmitting modes to "lock on" to selected targets, and determine the necessary geometry of the attack pulses. To fully exploit such potentialities, the weapon would require for its target-acquisition and beam-control systems, sophisticated high speed computers, able to perform complex computations of the "inverse-scattering" type. Miniaturized systems of this sort are well within the reach of 'fifth generation' computer technology. "Hybrid" digital-analog systems would be simpler, smaller, and faster still. There is much overlap in requirements between EP weapons and systems developed for strategic defense(SDI).

For concrete weapons applications, simpler devices will often suffice; trade-offs can be made among range, output power, extent of three dimensional field control, and sophistication of biological effects.

As was the case earlier with nuclear weapons, many people may be tempted to think that EP anti-personnel weapons constitute "absolute weapons" against which no defense is possible. A glance at the history of the SDI, or of military science and technology in general, shows why no such thing ever has or will exist.

An obvious aspect of defense is to detect, locate, and neutralize weapons before they can be used. Antenna structures of EP weapons are resonant structures which can be detected in various ways. Spetsnaz deployment of EP weapons can be countered by intercepting the weapons or weapons components in transport, by appropriate surveillance of the areas around potential targets, and by the whole range of countermeasures which can be taken against the Spetsnaz groups themselves. Of course, the EP weapon declares its existence as soon as it is turned on, and itself becomes vulnerable to rapid counterattack if readiness and appropriate means are at hand.

The famous "Faraday cage" and other forms of electromagnetic shielding can provide some protection against EP weapons, especially if the characteristics of the EP signal are known in advance and countermeasures are devised accordingly. Unfortunately, a sophisticated weapon can "tailor" its pulse to get through nearly any given kind of shielding utilizing non-linear, inverse-scattering techniques and a process known as "self-induced transparency." A Faraday cage under certain conditions can be transformed into an antenna, focusing the signal on the inside and even enhancing the effect for the unfortunate persons inside.

In theory, biological effects can be offset by creating a controlled "electromagnetic environment" around the target, with the effect of "detuning" the target relative to the anticipated signal of the attacking EP weapon - a kind of "immunization." To realize such potentialities will require a major research effort, but one having important spinoffs for biology and medicine.

The application of holographic principles to EP weaponry has profound implications for the future shape of warfare. The deployment of such weapons and the defense against them cannot be understood in

terms of "point-to-point trajectory" concepts associated with conventional firearms and artillery. Actually, even in the past, competent military doctrine has always emphasized the geometries of "fields of fire" generated by overall deployment of mobile weapons over a given area, as opposed to mere "straight-line" action of an individual weapon. the geometrical aspect becomes much more explicit in the era of EP weaponry, in which "firepower counts as the ability to control the electromagnetic field geometry on the field of battle, through coordinated deployment and operation of mobile phased arrays and related devices.

The situation could therefore be summed up as follows: in practice, both the use of EP weapons and defense against them is a tricky, sophisticated business, if the antagonists are at comparable levels of technology, knowledge, and preparation. A surprise attack against an unprepared enemy is simpler and very devastating. In this respect, EP weapons are no exception to the general rules of warfare."

Tennenbaum, Jonathan.(1988). Soviet Work on Electromagnetic Pulse Weapons. Executive Intelligence Review. Pg. 17

The 1987 edition of the U.S. Department of Defense review, Soviet Military Power, contains the following stern warning about the current Soviet mobilization to perfect electromagnetic pulse (EP) weapons: "Recent Soviet developments in the generation of radio-frequency (RF) energy have potential applications for a fundamentally new type of weapon system that would degrade electronics or be used in an anti-personnel mode. The Soviets already have or are working on much of the technology for such a system. In their research the Soviets have generated single pulses with peak power exceeding 1 billion watts and repetitive pulses of over 100 million watts.. No significant technological obstacles stand in the way of a prototype short-range tactical RF weapon."

In this Special Report, we shall document that the U.S.S.R. presently possesses the essential technological base, plus knowledge of advanced biophysics, to realize a wide variety of tactical and strategic electromagnetic anti-personnel weapons. We shall demonstrate this from the Soviets' own technical publications. Fortunately, we are not able to show pictures of EP weapons on parade in Red Square-if we could, it would be too late!

Figure 1 shows, on a map of the U.S.S.R., some of the known centers of Soviet work on the science and technology of EP weapons. For example, advanced high-power microwave generator work is carried out at the Applied Physics Institute in Gor'kiy near Moscow, at several institutes in Tomsk, at the Moscow Lebedev Institute, in Leningrad, Novosibirsk, and other locations. Advanced biophysical research of military importance is going on at the Institute for Biological Physics (G.M. Franck) at Pushchino near Moscow, at the Siberian Division of the Academy of Medical Sciences at Novosibirsk, at several institutes in Alma Ata, in Vladivostok, and at a number of establishments linked to the Soviet manned space program. (There is significant overlap between space medicine and the biophysics of EP weapons effects.) The question marks on the map indicate that only a very small part of the relevant research and development ever finds its way, even obliquely, into available Soviet technical journals. **Military secrecy is much stricter and all-encompassing in the East than the West.**

An interesting article appeared this year by one V.M. Koldayev in the Soviet journal Biologicheskiye Nauki dealing with "The Correction of Acute Microwave Exposure by Drugs-Experimental Results." In the article a large number of pharmaceuticals are evaluated for their capability of enhancing the resistance of the human organism to microwave radiation. Both preventive treatment, before exposure, and post-exposure treatment are discussed. Koldayev stresses a point which is key to the Soviet approach to microwave and radio-frequency effects: "Intensive microwave radiation changes the membrane characteristics of cells and ion transport, generates electrical breakdown at the boundaries of phase regions and other effects causing a destruction of living processes. Research in recent years has shown that the 'thermal conception' of microwave effects is inadequate."

Kolayev points to a major stumbling-block of Western biophysical research: the absurd, but stubborn insistence on the part of the Western research "establishment", that electromagnetic radiation could have no other effect on a living organism than to increase its temperature (I.E., in Koldayev's words, the "thermal conception"). As a result of this blind spot, many Western specialists still refuse to accept the existence of precisely those kinds of effects upon which the most lethal Soviet EP weapons depend.

The Soviets presently lead the world in research into a crucial, but not much publicized field called "optical biophysics," sometimes referred in the West as "bioelectromagnetics," which deals with the electromagnetic organization of living processes. Although modern research into this area goes back to

Louis Pasteur, the most consistent and sustained efforts were launched in Russia by V.I. Vernadsky (1863-1945), the physicist biologist, geologist, and architect of the Soviet atom bomb project.

Vernadsky's scientific training focused on the works of Pasteur and radioactivity pioneer Pierre Curie, and included visits to the Pasteur Institute and other leading European science institutes. Vernadsky initiated the systematic search for reserves of uranium and other technically crucial minerals throughout the Russian empire, and was a key organizer of the pre-World War I economic mobilization in Russia. **As founding director of the State Radium Institute in Leningrad, Vernadsky launched in 1926 a crash program of fundamental research into the "physical geometry" of living processes, which would include a comprehensive study of their interaction with electromagnetic radiation:**

"Only a few of the invisible radiation's are known to us at present. We have hardly begun to realize their diversity and the inadequacy of our knowledge of these radiations which surround us and pass through us in the biosphere, and to understand their basic role in the processes going on around us, a role which is difficult to comprehend by those accustomed to other conceptions of the Universe...We are surrounded and penetrated, at all times and all places, **by eternally changing, combining and opposing radiation of different wavelengths--from 10 millionths of a millimeter to several kilometers.**"

Out of Vernadsky's program came the Soviet military slogan: "He who controls the entire electromagnetic spectrum will dominate the world." It was Vernadsky who coined the now-common term "biosphere," emphasizing the fact that the totality of living matter on the Earth forms a coherent process in powerful mutual interaction with the climate and geophysical conditions of the planet. This work was the basis of the concept of "planetary war" advocated by Marshal Ogarkov, according to which all available scientific knowledge concerning the biosphere is to be mobilized in war in order to crush the enemy. This includes development of means of weather modification, manipulation of the ionosphere and other layers of the atmosphere, large-scale biological warfare, triggering of natural disasters, as well as **global electromagnetic warfare.**

Vernadsky's efforts provided the scientific atmosphere for the launching of the most powerful current of Soviet biophysical research, that associated with Alexander Gurvich (1874-1954). **Gurvich was the first to systematically demonstrate that absorption of minute amounts of "tuned" electromagnetic radiation, down to individual quanta, can decisively influence the course of biological events.** This is now known in the Soviet literature as the "informational role of electromagnetic radiation in biological systems."

In connection with this research, **Gurvich developed that first "field theory" approach to the geometry of living processes, and discovered the universal ultraviolet light emission of cells called "mitogenetic radiation". He was the first to point to the capability of biological molecules such as proteins and DNA, to absorb energy at long wavelengths and reemit the stored energy at much shorter wavelengths-phenomena which are intensively studied today under the name of "multiphoton processes in non-linear spectroscopy."** Gurvich was thereby a pioneer in the area of advanced research which is decisive for the most devastating forms of electromagnetic anti-personnel weapons.

Gurvich's student G.M. Franck founded the Institute of Biological Physics in Pushchino, which still bears Franck's name, and is today a key center of military-related research on electromagnetic pulse effects on biological systems. Another Gurvich disciple, Prof. Vlail Kaznacheev, heads the Medical Division of the Soviet Academy of Sciences in Novosibirsk, with close ties to the military space establishment. Kaznacheev carried out a decade-long series of experiments on the electromagnetic basis of the pathogenic action of viruses and poisons. Another member of the Gurvich school, Alma Ata biophysicist Inyushin, wrote an article in the Red Army paper Krasnaya Zvezda in 1984, declaring that breakthroughs of "revolutionary significance" were being made in the optical biophysics field. Since then, Inuyushin's name completely dropped out of Soviet scientific literature, indicating that he is now working in a top secret program. **Indeed, almost the entirety of the huge Soviet effort in biophysics of the Gurvich-Vernadsky variety has "gone underground" since 1983-84.**

One indicative area of continued Soviet publications is on the "non-thermal" effects of low-level microwave radiation in the millimeter wavelength band. Since at least the late 1960s, a U.S.S.R.-wide network of more than 21 institutes has conducted research into this field, led by Prof. N.D. Deyatkov of the Soviet Academy of Sciences. This research is continuing to this day. Late last year, for example, the Soviet microwave technology journal Radioelektronika published two long papers on biological effects, written by known members of the Deyatkov group. These papers discussed the mechanisms by which millimeter radiation interacts with internal electroacoustical oscillations, notably in cell membranes, to generate the resonant,

frequency-dependent effects documented in a large number of experiments.

The significance of these sorts of publications is not that they give a direct "peek through the window" at weapons-development; rather, they indicate an orientation of "civilian" basic research programs to the type of phenomena of relevance to weapons applications. (It is unlikely that electromagnetic anti-personnel weapons would work with pure millimeter waves. Millimeter-band "harmonics" would be included in complex pulse forms, however.)

Unfortunately, Devyatkov's area of research was all but closed down in the U.S., following the conclusion of "biological warfare accords" between the U.S. and the U.S.S.R. in the early 1970s-another concession from which the Soviets have extracted great strategic profit.

The capability to generate controlled high-power pulses of electromagnetic energy has long been a top priority area for Soviet applied physics research and development. It even has its own name in the Soviet literature, for which no direct equivalent term exists in the West: sil'notochnaya elektronika. It includes things like explosive cathodes and other technology for high-current relativistic particle beams, energy storage and pulse compression technology, non-linear plasma devices such as the plasma focus, "explosive" MHD power generation, EMP simulators, etc.

Significant parts of this R&D are being carried out in "purely peaceful" programs, such as **controlled fusion energy and accelerators for elementary particle research. So, Soviet development of gyrotron devices for ultra-high-power microwave generation has the "official purpose of providing means for heating plasmas in experimental fusion reactors.** And, in fact, gyrotrons can do exactly that. But, the technical advances thus made-or acquired from the West-under "civilian" fusion research programs with international cooperation, can immediately be transferred to secret military programs. **Thus, Rudakov's huge "Angara V" electron beam pulse generator, allegedly constructed for fusion research, was obviously motivated by some other reasons than just the publicized ones.**

Soviet development of high-power magnetohydrodynamic (MHD) generators is another interesting example. For many years, Vice-president of the U.S.S.R. Academy of Sciences E.P. Velikhov has directed a large program to perfect this technology for direct conversion of chemical combustion energy into electricity, for a variety of "peaceful" applications.

These are figures from 1977, ten years ago. Given intensive Soviet work in this field in the intervening period, we must assume that they can obtain the same or better output with much smaller devices. **These and the famous "Pavlovskii" pulse generators play an important role** in the Soviet's own version of the SDI, as power sources for beam weapons. They provide enough power for very devastating types of mobile anti-personnel weapons.

The heart of an EP anti-personnel weapon is the system for generating and emitting the electromagnetic radiation. Here the Soviets can draw from their vast experience with all types of military radars, including the large phased-array installations at Krasnoyarsk, Pechora and elsewhere, as well as advanced research **into relativistic electron beam devices for ultra-high-power EP generation. The article by Robert Gallagher documents how the Soviets have led the world in development of pulsed gyrotrons and related EP devices covering a wide frequency range.** This new hardware is being "spun off" in great quantity and variety as a product of the sil'notochnaya elektronika thrust. Nor have the potentialities of solid-state been neglected. While the Soviets may lag in some of the most exotic microchip technology, they are quite familiar with **solid state radar systems applicable (among other things) to miniaturized EP weapons. "Briefcase size" EP weapons for "close-in" Spetsnaz assassinations and related missions, are well within Soviet technological capability.**

Recently, it was announced that the U.S.S.R. intends to use its new, heavy space-lift system Energiya, with five times the payload of the American space shuttle, **to station some very large structures in orbit.** Besides a larger version of their present space station, one of the plans is for a huge "solar power station" which would relay its energy to Earth via a high-power laser or a beam of microwaves. (A similar project was considered by the U.S. NASA, but rejected because of the of inadvertently irradiating populated areas.) With a proposed several gigawatts of continuous power at its disposal, **such a station could carry out weather modification as well as electromagnetic warfare on a large scale.** Of course, compact nuclear reactors (which the Soviets are already using in radar reconnaissance satellites), especially in a pulsed mode, and MHD devices, could be much better energy sources for a military system. given a sufficient supply of energy, a large, phased-array EP system in orbit could attack entire cities, with loss of life comparable to nuclear weapons, but without collateral damage.

However, it is not necessary to station EP weapons in space in order to have firepower on a "strategic" scale. The Soviets have been early masters at combining their knowledge of geophysics and non-linear wave propagation to develop novel types of over-the-horizon radar. Using combinations of phased-array installations with a very large effective aperture, it is theoretically possible to project lethal electromagnetic signals over thousands of kilometers. At shorter ranges, incoming missiles and aircraft might be destroyed using EMP-like effects. Soviet activities should be closely watched in these respects, especially in view of the potential "dual purpose" exploitation of certain facilities.

(The following list is not intended to be comprehensive, but **merely exemplifies extensive Soviet scientific efforts in fields relevant to EP weaponry**. The interested reader will find further literature through the cited publications.)"

Editor's note. Here are more substantiating articles in support of Tennenbaum's information. It is in list format.

Liebig, Michael.(1988).Radio-Frequency Weapons: Strategic Context and Implications. Executive Intelligence Review. Pg. 42.

Michael Liebig is Managing Director of EIR nachrichtenagentur GmbH in Wiesbaden, Federal Republic of Germany. The following paper was presented at conferences in the Federal Republic of Germany, France, and Italy.

"...It is obvious that the whole complex of RF technologies, precisely because of the vast potential for military application, is highly classified. Detailed information on RF systems is extremely scant in the public domain. Yet we do know the scientific-technological basics of RF systems and their interaction with biological and other soft targets. While operational RF weapon systems may not yet exist as such, it can be stated categorically, that not just research, but development work towards operational RF weapons, is underway in the East and West, especially in the East.

Pg. 40. "Radio-frequency weapons" is a misleading name, carried over from a pragmatic understanding of earlier stages of electronic warfare. For example, it was thought, mistakenly, that the use of microwaves as anti-personnel weapons depended upon the heating effects of such waves upon targeted material. **Today, it has been shown that properly tuned electromagnetic pulses have mortal effects at levels of energy-deposit as low as two or three orders of magnitude below those required to kill cell-tissue by means**

of induced thermal effects. This comparison illustrates the importance of the term "non-linear effects."

The most important of the near-term applications of non-linear electromagnetic effects are in the domain of optical biophysics, either as strategic or tactical anti-personnel weapons, or to produce global effects within the biosphere surrounding those personnel. However, there is also the prospect of disintegrating non-organic material, as well as the disruption of apparatus, through the same class of technologies. In applying the notion of technological attrition to all such electromagnetic-pulse weapons as a general class, it is the principles causing all of the indicated range of effects which must be considered as a unit for purposes of shaping strategic doctrine.

All of the weaponry based upon "new physical principles," including lasers, particle beams, and non-linear electromagnetic-pulse effects, belong, together with the role of high temperature superconductivity, to the domain of sub-atomic physics. Modern high-energy physics, especially that focused upon so-called "force free" status of plasmas, shows that sub-atomic phase-space has a distinct, Kepler-Gauss sort of inherent curvature. It is also shown, that non-linear effects of coherent electromagnetic pulses, as phenomena of the macro-scale, are rooted in the non-linear physics of the curvature of "force-free," least-action states in the sub-atomic domain.

One of the most important lines of inquiry to this effect today, is modern optical biophysics' attention to the decisive role of precisely tuned, inherently coherent electromagnetic pulses in living processes.

Conceptually, this new work belongs to the tradition of Pasteur's work on optical biophysics and the definition of living processes presented by Luca Pacioli and Leonardo da Vinci nearly 500 years ago. **Essentially, modern instruments permit us to detect and measure localized coherent pulses in the range of quanta of emission, leading into what is called today "non-linear spectroscopy" of living processes. The comparison of the results obtained in this way in biological research, with lessons learned from high-energy physics of force-free plasma states, is the key to design of strategic and tactical anti-personnel assault weapons and related applications."**

Frazer, James W. PhD and Frazer, Joyce E. (1988, Mar. Apr.) How Radiofrequency Waves Interact with Living Systems. 21st Century. Pg. 50. Dr. Frazer, adjunct professor of pharmacology, University of Texas Health Science Center San Antonio. Dr. Frazer was featured as a weapons expert on CNN's Special Report, 1985 and discussed his ten year Air Force career and on electromagnetic effects. His conclusion that "radiofrequency weapons could be the wild-card in the arms race."

"The nonthermal effects of electromagnetic radiation on living cells offer clues as to what is life, as well as to understanding **Soviet research on the possibility of controlling human thought and emotional experience.**" Pg. 54. "In earlier work, Adey's group had shown a modulation sensitive effect on calcium efflux from chick brains. **These findings created considerable controversy**, but were completely substantiated by work done in Environmental Protection Agency (EPA) laboratories at Research Triangle Park in North Carolina. The subsequent history of their group is of interest. Adey's group continued with practical and theoretical **studies of nonlinear response of biological systems to low-intensity fields-but with nearly annual cuts in funding levels. The federal agencies monitoring that work have been fragmented and the people either left or transferred to other fields of endeavor. Price, Frazer, Mori, and all of the people performing the original lymphocyte experiments have resigned, been victims of reductions in force, gone into other areas of research, or retired. Thus, an area of research of great interest to theoretical biology has been very effectively choked off.**"

Wellborn Stanley & Daniloff, Nicholas. (1984, Oct. 1). Can U.S. Hold Its Lead Over Soviets in Science Race? U.S. News and World Report. Pg 53.

"The Soviets, for example, experiment extensively in parapsychology and psychic warfare," in modification of weather and in **the biological effects of microwave and other electromagnetic fields.** Much of this research is given high priority.

Commission on Security and Cooperation In Europe 102nd Congress First Session. The Moscow Meeting of the Conference on the Human Dimension of the Conference on Security and Cooperation in Europe 10 Sept.-4 Oct. 1991. Pg. 9.

"Many individual Soviet citizens also attended, seeking help in redressing grievances against the Soviet system after decades of lawlessness and arbitrary administration of justice. Complaints ranged from unjustified loss of employment **and placement in psychiatric hospitals to subjection to space-based**

rays launched and maintained by Soviet security organs. The U.S. delegation was able to do little more than listen to these individuals and forward their complaints to the Soviet delegation or the relevant republican authorities, suggesting to the Soviet delegation that it address the problems of these individuals."

Baker, CB.(1997?). Youth Action News.Pg. 6-7

the 1980 book: Human Possibilities: Mind Exploration in the U.S.S.R. and Eastern Europe, was written by a leading U.S. scientific researcher in parapsychology, Stanley Krippner, Ph.D. The book described the 1960 discoveries of Y.A. Kholodov, a leading Soviet expert on the effects of electromagnetic fields on the brain. ...Krippner continued: "These Soviet attempts to construct holographic models resembles the work of Karl Pribram, who has suggested not only that sensory information is relayed in bits and pieces to be sequentially reconstructed by neuron interaction, but also that sensory cells can interact as to form the sort of interference pattern typified by a hologram."

Baker, CB.(1984?).Electronic Mind-Control.

"At the 1979 U.S. Psychotronic Association conference, Lt. Col. Thomas E. Bearden provided additional information about soviet usage of ELF for mind control ...In 1968, Litisitsyn, who happens to run the documentation center (in the U.S.S.R.) which has all the medical information there, wrote a paper...reporting that the U.S.S.R. had 'succeeded in controlling the induction...of images and sensations... into another biological system--a human being.' "...Litisitsyn received his Ph.D. in highly esoteric, non-linear, mathematical brain-wave theory... "Litisitsyn's paper reported that the Soviets broke the genetic code of the human brain. "they worked out 23 EEG band-wave lengths, 11 of which were totally independent. So if you can manipulate those 11,youcan do anything to that living system it normally can do itself--anything at all. This is all from a paper in the (U.S.) Defense Documentation Center--1968, translation from the Soviet Union." "...the relationship between Soviet ELF signals and the Litisitsyn paper was described in a 1978 documentation packet on ELF issued by the Planetary Association for Clean Energy. ...The P.A.C.E. documentation continued: "Litisitsyn also reported that the Soviet scientists have developed and fitted a theory to actual brain wave measurements, and could insert material on electromagnetic carriers, directly into the brain and could control whether or not the process stimulated conscious awareness of the individual." ...The monitoring of time coherent and phase locked psychoactive modulations suggests strongly the following: The psychoactive modulation effectively locks -in the multiple carrier frequencies (say 11 to 23). On these locked -in multichannels, brain-coded information is inserted, feeding it directly into the captured target-brains." "Potentially, almost anything could be inserted in the target brain/mind systems., and such insertions would be processed by the biosystems as intercranially-generated data/effects. Words, phrases, images, sensations, and emotions could be directly inserted and experienced in the biological targets as internal states, modes, emotions thoughts, and ideas...."

Wortz, Edward C.et al.(198?)An Investigation of Soviet Psychical Research. in Mind at Large. pg. 235.

"The term psychotronics was coined by a French journalist after the analogy with electronics, bionics, nucleonics, and so forth. the Soviets have devised their own term-psychoenergetics. Pg.249

"A review of possible NBIT (novel biophysical information transfer) transmission mechanism that are compatible with current modern physics yields three schemes.

1. VLF and ELF electromagnetic waves.

2. Neutrinos, based on the photon theory of neutrinos.

3. Quantum-mechanical waves, based on the schizophysical interpretation of basic quantum mechanical theory.

Presently, most U.S. and soviet experiments on psychic phenomena, as well as the use of the law of parsimony, would point to ELF/VLF mechanisms, but the other two possibilities cannot be ruled out.

Chapter Four

What Scientists are saying about brain research? What physics, engineering and biology is needed to

develop mind control technology? What do scientist believe it takes to decode the brain? What is the level of neurological research today? The answers are conclusive. Will Russian and Soviet scientists develop neurological weapons on animals or humans? It is logical to believe the many claims by victims that brain functions and every nerve of the body can be controlled remotely with current technology.

Here is a list of what distinguished scientists are saying about neurotechnologies. These are just a few of many examples.

Russell, Christine.(1976, Feb. 23).Are Computer Hookups to the Brain Next? The Ultimate in Technology Predicted. Washington Star.

"...Such a prospect, dependent upon progress in '**breaking the internal codes of the human mind,**' **might be possible in as little as 20 years or may take "several decades more,"** according to Dr. Adam V. Reed. [Rockefeller University scientist]. But the 30-year-old experimental psychologist, who was earlier trained as an electrical engineer, expects to see "electronic extensions" of the brain within his own lifetime. His futuristic speculation was part of a symposium on "**Man-Computer relations**" **yesterday at the American Association for the Advancement of Science meeting** here. Reed acknowledged the need to protect against the dangerous applications of "thought control" -turning human beings into virtual robots-but his emphasis was on what he saw as potential benefits. ...**The main limit, however, is the difficulty of unraveling the internal language of the brain.** ..."I think there will necessarily be intermediate steps before people would even want direct hookups," said Dr. John McCarthy of Stanford University's department of computer sciences."

Greenfield, Susan.(1995). Journey to the Centers of the Mind. Towards A Science of Consciousness. W.A. Freeman & Co. NY. Pg. 196.

"If we could explain exactly how consciousness is generated by groups of neurons under certain conditions, it would also mean that we had the ability to manipulate on e another's consciousness to such a degree that it could lead to the effective annihilation of the individual. This specter is comparable to the ultimate, Frankenstein-like feat of the molecular biologist in creating organic life. Whether or not such a world would be a good place in which to live can only again be the stuff of science fiction."

Connor Steve.(1995, May 21).Science:The Last Great Frontier: The Brain is the Ultimate Enigma.The Independent(London).Pg52.

"The human brain is the most complicated structure in the known universe. ...No superlative, it seems, is too grand to explain what is happening to brain research, precisely midway through the **international "Decade of the brain"** **Gerald Fischbach, professor of neurobiology at Harvard**, believes philosophers inquiring into the human condition can no longer ignore the brain experiments that are "among the most urgent challenging and exciting" in all of science. "Our survival and probably the survival of this planet depend on a more complete understanding of the human mind." he says.

Cornwell, John.(1994,Sept.4).A Mindfield For the Brains Trust.Sunday Times. Lexis-Nexis.

"...Penrose the 62-year old Rouse Ball Professor of Mathematics at Oxford...who made his name by collaborating with Stephen Hawking in the 1960s on black holes, was drawn to the consciousness debate in the late 1980s... ..In *Shadows of the Mind*, **Penrose demonstrates that mathematics and physics are more central to the problems of consciousness than computer science or even biology. At the same time, he urges that physics must take consciousness into its scope. "...We must look for a feature of the brain," he says, "that can mediate between the microscopic world of quantum physics and our everyday realm of classical physics."** According to the view prevalent in neurobiology, brain action is entirely controlled by the interconnected system of "neuron switches" and nothing else: there is no plausible role for the subtleties of quantum action. But basing himself on research of **Stuart Hameroff, an anaesthetist at the University of Arizona, and the work of Herbert Frohlich, a noted physicist who has made important advances in the study of superconductivity, Penrose believes he has come up with a suitable site and structure for quantum activity in the brain.** In his new book he describes how cell structures known as microtubules, found in the branches of neurons (brain cells), have the ability to shrink and expand between the microscopic realms of the quantum and our familiar world of switches," says Penrose. "The microtubules are themselves microscopic tubes made of proteins called tubulins. Each tubulin individually seems to behave something like a switch, increasing neuronal numerosity by something like 10,000m" If Penrose is right, his book may be the first accessible report to a general readership about the site, if not the actual substance, of **the Holy Grail of consciousness the precise point where quantum activity interacts with classical physical activity in the brain.** ...and by body-soul dualists such

as the veteran neurophysiologist Sir John Eccles, who believes that a quantum physical effect mediates our spiritual souls and our physical brains. ...**Our conscious brains, he declares, are woven from subtle physical ingredients that somehow enable us to take advantage of the profound organization of our mathematically underpinned universe...** ...Penrose confesses he is very far from explanations; but he is adamant that no clear answers will come unless the interrelating features of physics, mathematics, biology and psychology are seen to come together...

Jibu, Mari, Hagan, Scott, Hameroff, Stuart R., Pribram, Karl H., Yasue, Kunio.(1993, August 10)Quantum Optical Coherence in Cytoskeletal Microtubules: Implications for Brain Function. BioSystems 32(1994)195-209.

"Abstract 'Laser-like,' long-range coherent quantum phenomena may occur biologically within cytoskeletal microtubules. This paper presents a theoretical prediction of the occurrence in biological media of the phenomena which we term 'superradiance' and 'self-induced transparency'. Interactions between the electric dipole field of water molecules confined within the hollow core of microtubules and the quantized electromagnetic radiation field are considered, and microtubules are theorized to play the roles of non-linear coherent optical devices. Superradiance is a specific quantum mechanical ordering phenomenon with characteristic times much shorter than those of thermal interaction. Consequently, optical signaling(and computation) in microtubules would be free from both thermal noise and loss. **Superradiant optical computing in networks of microtubules and other cytoskeletal structures may provide a basis for biomolecular cognition and a substrate for consciousness.**

Moravec, Hans.(1988). Mind Children The Future of Robot and Human Intelligence.

Editor's note; Moravec is an MIT professor, well-known and was on the Learning Channel on Dec 16, 1997 on the program Future Fantastic. He explains artificial intelligence and replacing the brain with a computer.

"Perhaps, with advances in high-resolution scanning, it will be possible to achieve this effect without messy surgery: you might simply wear some kind of helmet or headband that monitored and altered the interhemispheric traffic with **carefully controlled electromagnetic fields.**

Rucker, Rudy.(1997, April 25).Imagined Worlds".International Herald Tribune. Pg. 4.

"By Freeman Dyson. ...Harvard. Reviewed by Rudy Rucker. **"The dominant science of the 21st century will be biology."** [physicist] **Dyson expects great advances in two areas of biological knowledge: the gene and the brain. He suggests that the first may give us pet dinosaurs, and the second may bring about "radiotelepathy."**..."Radiotelepathy" is a word coined by Dyson to express a surprising but logical idea: You could have something like a cordless phone inside your head. That is, "After the organization of the central nervous system has been explored and understood, the way will be open to develop and use the technology of electromagnetic brain signals."

Dyson, Freeman.(1997)Imagined Worlds.President and Fellows of Harvard College. Acknowledgments.

"This book grew out of a set of lectures given in May 1995 at the Hebrew University of Jerusalem... ...The idea of radiotelepathy first appeared, so far as I know, in the science-fiction novel Last and First Men, written by Olaf Stapledon, in 1931, ...in which the cells of a multicellular creature communicate with each other by means of electric and magnetic fields... **The chief barrier to progress in neurophysiology is the lack of observational tools. To understand in depth what is going on in the brain, we need tools that can fit inside or between the neurons and transmit reports of neural events to receivers outside. ...observing instruments...with rapid response, high band-width and high spacial resolution...There is no law of physics that declares that such an observational tool to be impossible. We know that high-frequency electromagnetic signals can be propagated through brain tissue for distances of the order of centimeters. We know that microscopic generators and receivers of electromagnetic radiation are possible. We know that modern digital data-handling technology is capable of recording and analyzing the signals emerging from millions of tiny transmitters simultaneously. All that is lacking in order to transform these possibilities into an effective observational tool is the neurological equivalent of integrated-circuit technology. We need a technology that allows us to build and deploy large arrays of small transmitters inside a living brain, just as integrated-circuit technology allows us to build large arrays of small transistors on a chip of silicon. ...Radioneurology is in principle only an extension of the existing technology of magnetic resonance imaging, which also used radio-frequency magnetic fields to observe neural structures. A rough estimate based on the available band-width indicates that a million transmitters could be monitored through each patch of brain surface with size equal to the radio wave-length. The factor of a million is the ratio between**

the radio band-width, of the order of hundreds of millions of cycles per second, and the band-width of a neuron, of the order of hundred of cycles...."

Greenfield, Susan.(1996, Feb.25).Science: From Socrates to Silicon Chip?; Artificial Intelligence has evolved so far... So are computers nearly conscious? The neuroscientist Susan Greenfield argues that it all depends on what 'conscious means."

"...Hence there is obviously a strong chemical-selective element in determining consciousness. ...Admittedly, advanced machines are no longer in thrall to digital on/off operations, and **a silicon "retina" and "neuron" have been built with analogue (ie dimmer switch) properties.**

[Contents](#)

Superconducting Quantum Interference Device (SQUID)

This is a list of excerpts from books and articles to demonstrate the level of brain mapping and reading today. SQUID seems to be the basis of classified technology used to read brainwaves remotely. In *The Brain Code, Mechanisms of Information Transfer and the Role of the Corpus Callosum* by Noram D. Cook, 1986, he writes Phrases such as the 'brain code are used to describe the set of fundamental rules concerning how information is stored and transmitted from site to site within the brain. ...how large groups of neurons transmit the images, thoughts and feelings which we suspect are the fundamental units of our psychological lives. ...The perspective on brain function discussed in the following chapters is not claimed to be a complete unraveling of the brain code, but I do believe that it is the beginning of same and that the direction of future developments is already clearly indicated."

Coyle, Anna.(1992, Sept.14). Science and Technology: The Machine That Watches You Think. Independent(London). Pg.14.

"Doctors and medical scientists soon will be able to watch the human brain "thinking". With the aid of a device no bigger than a pinhead, they will be able **to see exactly where and how electrical signals are traveling around the brain. ..."****We are aiming to build up an image of where the current is flowing,"**says Dr. Steven Swithenby, director of the Biomagnetism group at Open University... **...Squid is the acronym for superconducting quantum interference device, and it measures magnetic flux or field extremely accurately at ultra-low levels, such as the level reached when a group of neurons in the brain is triggered.** The device is made of a ring of superconducting material, usually niobium metal, a few millimetres wide, with a slice of insulator, a few atoms thick, sandwiched into the loop. when an electric current is applied to this superconductor, the flowing current generates a magnetic field around the wire loop. Inside the superconducting loop this magnetic field is extremely sensitive to any changes in magnetism. If a change in magnetic field is detected, the current flow in the Squid changes to re-adjust the field strength to counter the external force. ...But there is still the problem of interpreting the information. "We can look at what is going on in the head, but **it takes a lot of mathematics to unscramble the whole mess so that we can make a sensible image,"** Dr. Swithenby says. **...The magnetic field generated by the brain in response to an external stimulus, and measured by the Squid, is about 100 millions times weaker than the Earth's magnetic field,** and a million times weaker than the magnetic fields around overhead power cables. ...A less expensive and more practical approach, used at the Open University, is to couple the Squid to another device known as a **gradiometer**. In effect the gradiometer is a matched pair of (non-superconducting) magnetometers placed between the Squid and the patient's head. One of the pair measures the external magnetic field outside the brain, the other measured the total field, including the contribution from the brain, and the difference between the two is measured by the Squid....The so-called high -temperature superconductors-metal oxides that can work at temperatures of up to 100 degrees above absolute zero- are the next stage in the development of workable machines. **..."****In three or four years' time, who knows what Squids will be made of?"** Squids are not new: they were first postulated by the theoretical physicist Anthony Leggett at the University of Illinois in the early Eighties."

Author's note. These articles give examples of how thoughts could be detected remotely. It is not impossible, especially with the will to develop this technology before the Soviets do, for example.

Hanley, John M.D.(1985,June17).Aviation Week.Pg. 156.

"...It has never been necessary to stick something into pilots, or anybody else for the purpose of obtaining

brainwave signals. It was pointed out 50 years ago by B.H.C. Matthews that non-invasive scalp electrodes provide the necessary sensing, and that is the method most in use around the world today. As for sticking something onto pilots, **the evolution of sensors has a branch of non-adhesive, contact electrodes, highly stable examples of which were developed in our Space Biology Laboratory almost 20 years ago under NASA contracts, and put to practical use in a variety of environments, both space and terrestrial. The continued evolution of the electrode has inevitably traversed the path from nonadhesive and contact to remote, non-contact sensing. Fourteen years ago, Adey and Silver, of the University of California at Los Angeles and Aerospace Corp., respectively, at that time, proposed cryomagnetic sensing of the EEG. Magnetoencephalograms were obtained by Cohen of the Massachusetts Institute of Technology one year later.** Moreover, sophisticated machine recognition of EEG correlates of states of awareness from the subtleties of pilot reclination to sleep in the space environment have been achieved within the last two decades. Clearly, dogmatic assertions that present technology has remained at the stick-on or -in electrode and gross delta wave era belong with scriptural championing of slingshots as state-of-the-art weaponry.

No author. (1989, July 5). Magnetic Fields of the Brain. PR Newswire.Lexis-Nexis.

"The human brain is alive with pulsating magnetic fields. ...The brain's nerve cells, called neurons, are triggered by small electrical currents. This has been known for decades and doctors routinely record the intensity and patterns of these electrical brain waves. ...Today, highly sensitive detectors can spot even these faint magnetic fields and [physicist Samuel] Williamson a member of the American Physical Society, and his colleagues are busy mapping the brain's magnetic activity. Every brain function, from imagining a pay raise to lifting a forefinger, uses the neurons of a specific location. Detecting magnetic fields can pinpoint these geographical areas. In one instance, Williamson discovered which part of the brain generated a magnetic field when a subject moved a forefinger. Moving the thumb produced fields from a slightly different spot. "Our sensory and motor systems are tied to highly specific brain areas," says Williamson. "in one experiment we passed a brushover the tip-center and base of a person's finger. We found that this produced magnetic fields from three distinct areas of the brain." Magnetic research of the brain is of great interest to surgeons, doctors, and psychologists. **With this tool specific brain locations are being linked to specific body activities. In the area of psychology, monitoring the brain's magnetic activity is helping determine the nature of imagination and thought processes.** ...this feature is from the American Institute of Physics' Science Report."

No author.(1996,Oct.8).Pictoral Proof of Brain Damage Caused by Cocaine and Alcohol Seen in New Quantitative EEG Studies:BEAM Study Provides New Light on Brain Disorders. PR Newswire.

"Measurements of "brain waves" using state-of -the-art **quantitative electroencephalography (QEEG) -- or brain electrical activity mapping (BEAM)** demonstrate that both cocaine and alcohol abuse/dependence significantly worsen such pre-existing brain abnormalities as attention-deficit hyperactivity disorder (ADHD), major depression, mental distress, anxiety disorder, and paranoid schizophrenia, according to medical research by Eric R. Braverman, MD. and Kenneth Blum, Ph.D. both affiliated with the PATH Foundation, a not-for-profit scientific foundation of Princeton, New Jersey. **...since they[QEEG and BEAM] are relatively easily, quick and potentially inexpensive to administer...Unlike other brain imaging techniques, it can be administered in a doctor's office. ...Other work by Drs. Braverman and Blum, as well as by other researchers, suggests that a mentally ill population--including teens and adults--have strongly disturbed brain waves even prior to their substance abuse. This study again documents that the mentally ill population have brain electrical and chemical imbalances. ...BEAM is a brain stress test using light, sound, cognition, and electrical stimulation to generate dramatic pictures of total brain health..**

High-temperature Superconductors

(HTSC) contains the theory and basis for the technology used for remotely detecting brainwaves from a distance. Currently the military is developing it for remote sensing. While this may not be the classified mind reading technology used today, the point is to see that the level of technology is possible and the scientific theory behind mind reading can be figured out, even if it is classified. Please note that the Jonathan Tennenbaum article mentions HTSC and it's use for mind control weapons. Here is a list of articles on HTSC with brief comments.

Hewish, Mark.(1992,June 1). High-temperature Superconductors. International Defense Review. Vol.25. No.6; Pg. 624.

"The United States government Office Of Technology Assessment believes that electronic components using high-temperature superconductors(HTSCs) will be available by the mid-1990s. ...DARPA(the US Defense Advanced Research Projects Agency) has awarded several contracts for work on HTSCs. E-Systems'Melpar Division leads a team--including several universities and specialist companies such as Superconductor Technologies and Conductus--that has a \$9.7 million contract from the agency to demonstrate a feasible approach to defense applications of HTSCs by 1994. ...HTSCs first made their appearance in 1986, when two researchers at the IBM laboratories in Zurich--who won a Nobel prize for their work...Radio-frequency energy encounters some resistance even in a superconductor, but this is negligible at frequencies below 1 GHz. ...**Most radars of military interest operate at frequencies below 120GHz...** ...Superconductors additionally exhibit the Meissner effect. **A magnetic field will not penetrate a superconductor cooled to below its transition temperature.** This effect is exploited in electromagnetic rail guns, and superconductors are also almost perfect materials for magnetic and electromagnetic shielding. SQUIDS(superconducting quantum interference devices) have military applications in magnetometers used to detect submarines and mines. SQUIDS can detect the most tenuous magnetic fields, even those generated by brain cells. They exploit the properties of a Josephson junction, which is constructed from two superconductors separated by a non-superconducting layer. Lockheed has built an HTSC SQUID... ...The phenomenon of superconductivity was discovered in 1911, but the first high-temperature superconductors(HTSCs) did not become available until 75 years later.

Rose, Stephen.(1994, Dec.1). Off Line: The Life of Brain. Guardian(London). Pg.14.

"...**Helsinki is the site for Europe's most powerful neuromagnetic measuring system.** ...In 1929, the Swiss amateur physiologist Hans Berger taped a set of recoding electrodes to a person's scalp and found he could record continuous bursts of electricity pulsing through the brain. ...As every O-level student knows, where there is an electric current, there is a magnetic field at right angles to it. **So too in the brain - except that because the currents are tiny, so are the magnetic fields, around one millionth billionth of a Tesla.** ...Then you can measure the oscillating millisecond fluxes of the brain in real time. Furthermore, unlike the EEG, granted enough mathematical sophistication and computing power, you get a good idea of the location of the electromagnetic source in the brain. In Helsinki the neuromag is linked to an online recording system that enables an experimenter sitting outside the sealed room to scan the records of the 122 channels arrayed across the inmate's head, I was strongly reminded of that ancient philosopher's dream, a 'cerebroscope' that would enable a person to observe their own thoughts. Magnetoencephalography is the nearest neuroscience has yet got to such an instrument...."

Editor's note. The above article in bold describes as briefly as can be done, the probable scientific basis for reading thoughts remotely. It is scientifically possible. The major details almost certainly are classified.

No author.(1990, Sept.17).**Professor Guy Deutshcer** Joins Xsirius Superconductivity Inc.PR Newswire. Lexis-Nexis.

"Xsirius Superconductivity Inc.a Scottsdale firm engaged in commercializing high-temperature superconductors, announced recently that Dr. Guy Deutscher has agreed to serve as a key consultant for the company in its international effort to bring high-temperature superconductors to the marketplace. Deutshcher is **one of the key innovators of the important superconducting device--the "SQUID" or Superconducting Quantum Interference Device**" and holds a patent for this device. SQUIDS are used to detect extremely weak magnetic fields and are potentially useful in such applications as submarine detection and in measuring subtle electromagnetic signals from the brain. Deutscher has been professor of physics at Tel Aviv University since 1973. ..and has since established a reputation as a world-renowned authority in the field of superconductivity."

Editor's note; The following article states that remote sensing technology can be fixed in satellites. It is not impossible to develop a method for remotely reading brainwaves. The level of technology is here today.

No author.(1990,July12).Federal Germany Develops Superconductive Antenna For Space and Medical Use. Xinhua General Overseas News Service. Lexis-Nexis.

"...has successfully developed a superconductive antenna for space and medical use. The antenna, made of high-temperature superconductor, can be fixed in satellites to receive the electromagnetic

wave emitted by earth so that researcher can exactly determine the humidity in soil and the content of water vapour. The antenna can also be installed in medial instruments to help doctors determine the faint signals from brain and heart."

Brown, Malcolm.(1989,June6).Hopes for Superconductivity Begin to Fade.New York Times.Section C.P. 1.

"...[American Superconductor Corp.]The company was founded two years ago in collaboration with scientists from the Massachusetts Institute of Technology to create high-temperature superconducting wire.

...Conductus Inc. of Sunnyvale, Calif., which draws expertise from scientists at Stanford University and the University of California at Berkeley..."

Editor's note. The above article also shows how universities, the military and private business are working closely on military technology.

No author.(1997,June16).Superconductive Magnetic Shield: Hitachi Group. Comline Daily News Electronics. Lexis Nexis.

"Japan Science Foundation(JSF) has certified that Hitachi Chemical Co. and Hitachi Cable,Ltd. have successfully developed "manufacturing technology for bismuth-lineage superconductive magnetic shields." JSF, which consigned the project to the two companies, claims the shields are much smaller and consume considerably less energy than existing types. One superconductive shield, developed by Hitachi chemical, will be **used for measuring weak biological magnetic fields**.... According to JSF sources, the former shield can dampen external magnetism by more than five digits and the later to a level close to that of geomagnetism.

Editors note. The scientists are stating that the technology is possible and many other articles below indicate the interest and level of technology today. Mind Control technology is a growing area of research and victims claims of remote reading of thoughts is possible, especially since this book only lists unclassified sources.

[Contents](#)

Military and Government Research

Here is a list of articles on what the military and government are researching and how they are developing this technology. There is research into detecting and using every body signal including brainwaves, for example for pilots to fly using their thoughts and for soldiers and remote battlefield medicine. Victims claims are not farfetched. It becomes clear that the technology can be tied to victim's allegations.

Marsh, Alton K.(1979, Jan.29). USAF Studies Arming Weapons Vocally. Aviation Week. Pg. 239.

"...Thus far the research has resulted in the ability to predict the perception and recognition of letters. ...The area of evoked brain response development and applications holds promise as a method of automatically compensating for pilot fatigue. It can also assure the pilot will not make errors during the flight, by taking the pilot's brain waves through unobtrusive sponge sensors in the flight helmet. **Evoked response refers to "driving" the brain, forcing it to emit brain waves at regular intervals, either through use of light flashes in the eyes or laboratory-generated clicks in the ears.** It is research that has come into its own only in the last two years. **By measuring the amplitude of the brain waves generated,** fatigue of the pilot can be recognized. By increasing the brightness of the instrumental panel lights, the amplitude of the brain waves can be returned to their normal height, thus compensating for fatigue. To get the "evoked response" from the pilot's brain, the instrument panel lights could be made to flash so fast that the pilot would not be aware of the flashes. **Researchers think the brain can "register" up to 145 flickers per second,** Lt. Col Robert D. O'Donnell, an experimental psychologist, said. It also could be used to prevent errors, **since scientists have discovered that responses occurring after the wave could be "locked out" electronically, preventing a pilot from making an error,** O'Donnell said. **...The follow-on system aims a small amount of near-infrared light into the subject's eye, causing a spot of light to be reflected off the cornea. The spot is picked up by a remote oculometer and fed to a computer, which calculates the angle between the center of the eye pupil and the spot.** ...Later, after the remote oculometer has been combined with more advanced simulation capabilities, work will be directed toward a helmet-mounted oculometer to track eye movement.

Uhlig, Robert.(1997?). The End of Death: "Soul Catcher" Computer Chip Due.Electronic Telegraph(England) (From CNI News).

"A computer chip implanted behind the eye that could record a person's every lifetime thought and sensation is to be developed by British scientists. ..Dr. Chris Winter, of British Telecom's(BT) artificial life team. Dr. Winter's team of eight scientists at BT's Martlesham Heath Laboratories near Ipswich calls the chip the 'Soul Catcher.'BT's **official futurologist, has measured the flow of impulses from the optical nerve and nerves in the skin, tongue, ear, and nose....**"For example, police would be able to use it to relive an attack, rape, or murder from the victim's viewpoint to help catch the criminal." Editor's note. Delores Hejazi claimed to have experienced this. See CAHRA website under Intelligence tools.

No author.(1985,Sept.)Advanced Technology Report.Defense & Foreign Affairs.Pg.35.

"...In California, it is rumored, a University-sponsored experiment has found that brain waves emitted by patient volunteers in a mental hospital have successfully controlled the switching of electric trains, making them go and stop at will. ...**Sources said it even has a name by which it is known around DARPA (Defense Advanced Research Projects Agency): a "psychotronics."**

Gourley, Scott et al.(1995, August1).Saving Lives While Saving Money: Military Medicine Moves From MASH to Star Trek. International Defense Review.Vol.28.No.8.Pg.45.

"...The US Department of Energy's Pacific Northwest Laboratory(PNL), in collaboration with the Madigan Army Medical Center, is developing an Advanced Imaging System(AIMS) that uses **ultrasound to locate and monitor internal injuries.** ...Over the next three years, PNL and Madigan will develop **a portable field prototype consisting of an imaging array, with 1024 transducers,** measuring 5x5cm; ...If initial work on AIMS is successful, it could be followed by two further phases. The first of these, lasting two years, would replace the earlier transducer array with **a conformal gel blanket have an area of some 2500cm. a subset of the array, placed around a body cavity, would be sequentially scanned to generate a larger and more detailed image.** ...a possible further phase, lasting three years, would involve developing an **"imaging bed" with an area of 1000cm. This would contain an array of high-resolution ultrasonic transducers and perform additional functions, such as magnetic-resonance imaging, and ...**...PNL says that **it may even be possible, by this stage, to monitor the patient's brain by using advanced electromagnetic sensors."**

Bucholtz,Chris.(1995, May3).Thought Control A Step Nearer.Flight International.Lexis-Nexis.

"Scientist at the Aeronautical Systems Centre (ASC) at the US Air Force's Wright-Patterson AFB, Ohio, are studying the use of brain-actuated control techniques as a means of controlling aircraft. ...In the past, the problem with thought-control techniques has been **discerning the faint electromagnetic brain signals which accompany voluntary thought from the flurry of "background noise" in the brain caused by everyday activity.** In the ASC experiments, pilots in a simulator face two fluorescent lights, **which pulse at 13.25 Hz. This causes nerve cells in the subject's visual cortex to fire at the same frequency. Electrodes on their heads detect the resulting brain-wave patterns, feeding them to an amplifier and a filter. The filter picks out the 13.25.Hz waves and measures their power.** A bar scale displays a measurement of these waves, which allows the subjects to learn how to vary the intensity of their brain responses. On the simulator, heightened intensities cause it to bank to the right; depressed intensities cause it to bank to the left. ..."They say it's like learning to walk..." Project physicist John Schnurer adds..."

Scott, William.(1994,Aug.15).No title.Aviation Week and Space Technology.

"...For more than 30 years, the U.S. military services have been intrigued with the concept of linking human brains with computers or other hardware. A retired colonel confirmed that the Army conducted experiments in the 1960s aimed at controlling air defense missiles with brainwaves. More recent research attempted to improve the combat performance of U.S. special forces, which rely on critical timing and zero-margin teamwork. ...An industry scientist said that the Army's Research Institute worked on a variety of "neurotechnologies" in the mid-1980s, ostensibly abandoning the program--although there are indications to the contrary. Since these activities were classified, military officers will not comment on the success or failure of such programs. In any event, more than 2,000 "white world" technical papers and research reports describe aspects of neurophysiological work in the U.S., Europe and the former Soviet Union. Only recently, however, has there been a concerted effort to harness research results and convert them to concrete applications. ...M Barry Sterman...A 30 year veteran of neurophysiology research, Sterman is a professor at the University of California-Los Angeles School of Medicine...Sterman's focus is on "neuroregulation," a term that highlights the neurological response to cognitive demands {of B-2 pilots}... ..A pioneer in this effort is Advanced Neurotechnologies, Inc.(ANI) of Colorado Springs, Colo. Its founder, Richard Patton, combined a personal

computer, sensors, commercial electronics, a Motorola 56000 digital signal processor and proprietary software routines to create what he calls the "BrainLink" system. Sensors attached to a headband--or adhered directly on the client's scalp--detect brainwaves that approximate a traditional electroencephalogram(EEG). **Signals are amplified and converted from analog to a digital format**, then fed to a Motorola digital signal processor. The DSP performs a **high-resolution fast-Fourier transform**, converting the time-domain brainwave signals to the frequency domain. **...teaches a client to control the display and tones, which correlate to desired brainwave patterns associated with specific mental states."**

No author.(1996,March 12).ARPA Battlefield Care Project to Shake Up Medicine. Armed Forces Newswire Service.

"DOD's Advanced Research Projects Agency(ARPA) has quietly ignited the most radical series of technological changes to hit the practice of medicine since the invention of X-rays. ARPA's medical-technology stable includes an array of high-fidelity virtual-reality medical training and diagnostic simulators; **satellite-aided tele-diagnostics for soldiers, now being used for Bosnia operations; tiny embedded diagnostic sensors; telerobots that let remote MASH surgeons operate on badly wounded soldiers; miniature intensive care units that automatically monitor soldiers; and infusively treat soldiers being helicoptered from front lines to MASH units; and high-speed networks that can automatically fuse data from giant databases around the world.** The most crucial component of future combat care, said Richard Satava, ARPA's biomedicine program manager, is the personal status monitor(PSM), **a continuously worn monitor that he would like to see woven into the soldier's clothing. The PSM would monitor a wide range of vital signs and also host external communication, GPS and other functions. Tied into the PSM might be clothing with "sensate liners," that would detect projectile exit wounds and infer the organs damaged by defining the pathway from entry to exit wounds.** Today's edition of Technology Transfer Week reports Satava is particularly excited about a dime-sized PSM sensor, originally developed to fit on bumblebees for radio tracking, that is woven into clothes, and mounts a tiny radio and vital signs sensor.

No author.(1995,June1)The Power of Thought.Daily Mail(London).Pg.40.

"...special electrodes being developed by researchers at the Wadsworth Centre in Albany USA. They attached electrodes to the scalps of volunteers and asked them to move a cursor towards a target on a video screen by thought. Tiny electromagnetic brain signals were amplified by a computer deciding when and how to move the cursor.

No author.(1995,Mar.25).Short Takes;American Topics.International Herald Tribune (France).Lexis-Nexis.

"...The brain emits electrical signals of only a millionth of a volts or so. But studies financed by the National Institutes of Health show that these signals can be amplified enough so that by conscious effort, the subject can move a cursor on a computer screen.

Stork, David G.(1996?).Hal's Legacy 2001's Computer as Dream and Reality.MIT Press. Pg.164.

"Raymond Kurzweil. ...There are already precursors of such a project. For example, a few years ago Carver Mead's company, Synaptics, created an artificial retina chip that is, essentially, a silicon copy of the neural organization of the human retina and its visual-processing, as the human brain does."

Smith, Cyril W. & Best, Simon.(1989). Electromagnetic Man. Pg. 236.

"A team at York University's Physics Department, for example, has built and tested a 'Faraday magnetometer' under contract to GCHQ, to pick up very weak magnetic fields, possibly for use in remote eavesdropping(The times, 1988)."

Chapter Five

Here are a few articles which describe the Korean brainwashing of the 1950s. It clearly demonstrates the necessary political will to support a massive effort to control man before the Russians do, including projects to solve the mysteries of the brain for political and military purposes. The Korean brainwashing scare seems to be the event that triggered the race for the brain code.

No author. (1977, Aug.2). Mind-Control Studies Had Origins in Trial. New York Times.

In the summer of 1977, it may be difficult for Americans to comprehend the frame of mind of the men who nearly 30 years earlier started the Central Intelligence Agency's effort to manipulate human behavior. As some of the former high-ranking CIA men recall now, they had looked into the vacant eyes of Joseph Cardinal Mindszenty at his treason trial in Budapest in 1949 and had been horrified. They had been convinced that his confession had been wrung from him while he was either under the influence of some mysterious, mind-bending drug or that he was standing before the dock in a post-hypnotic trance. The sight touched off memories of earlier "show trials" in the Soviet Union. The CIA leaders were certain the Communists had embarked on a campaign to control men's minds and they were determined to find a defense, setting out in earnest the next year-1950-with Project Bluebird...

Slesin, Louis.(19?). "Zapped? Radiation at Greenham Common Peace Camp" The Nation. Editorial Pg. 313.

Louis Slesin editor of the publication Microwave News stated: "In The Search for the Manchurian Candidate, published in 1979, John Marks relates that in response to a Freedom of Information Act request, **the CIA told him that it had a roomful of files on electromagnetic and related techniques to alter behavior and stimulate the brain. The agency refused to release the papers, and they remain classified.**"

Subcommittee on Health and Scientific research of the Committee on Human Resources United States Senate, September 20 and 21, 1977.

Gottlieb, Sidney, Md.. former CIA agent. Pg.169.

"In the judgment of the CIA, there was tangible evidence that both the Soviets and the Red Chinese might be using techniques of altering human behavior which were not understood by the USA and which would have implications of national survival in the context of national survival in the context of national security concerns at that time. **It was felt to be mandatory and of the utmost urgency for our intelligence organization to establish what was possible in this field on a high priority basis.**"

Pg. 202. "Dr. Gottlieb. ...As I remember it, there was a current interest, running interest, all the time in what affects people's standing in the field of radio energy have, and it could easily have been that somewhere in many projects, someone was trying to see if you could hypnotize somebody easier if he was standing in a radio beam. ...I would remind you that the problem of radio waves and what it does to people is [an] extremely current interest in connection with events in an important embassy overseas now. There is great concern about that."

[Contents](#)

Chapter Six

The history of science, the military, corporations and government involvement from the 1940s up to today. Classified military research was used to fight the cold war. It can be seen how mind control technology could be developed out of the public eye and with the support of top officials. Teams of elite scientists were used to tackle military problems. The Cybernetics Group, Brain Research Institute, the Institute for Defense Analysis and their JASON Group and also their Golden Fleece Group are a few examples given below. Prominent scientists were given military funding generated by the race to surpass the Russians.

By looking at the nature of the scientific military organizations which sponsor Manhattan Projects, the origins of mind control research can be found. This is the point of this lengthy but very interesting information. Atomic bomb research and mind control research do follow a similar pattern. The same corporations, military offices, scientist's names and leading officials are repeatedly found in several different sources listed below. Radiation and mind control experiments occurred in the cold war era within the same bureaucracy.

McDougall, Walter.(1985)The Heavens and the Earth. Basic Books.

"...the AAF, however, turned to its new advisory body, the RAND Corporation, for an independent opinion on the prospect and value of an earth satellite. ...the USAF also assigned RAND the task of "continuing studies of the potential military utility of earth satellites-including work on the use of such devices for cold war politico-psychological advantage for communications and for purposes of observation." **...In March 1954 Eisenhower summoned the Office of Defense Mobilization's Science Advisory Committee and apprised its members of the growing danger faced by the United States....It was imperative that the**

best minds in the country attend to the technological problem of preventing another Pearl Harbor. The result was the Technological Capabilities Panel(TCP) Report, or "Killian report," ...Its authors included James F. Killian, later president of Bell Labs,...Edwin H. Land, inventor of the Polaroid camera ...and over forty scientists and engineers. Reporting to the NSC in a "full-dress" secret session, The Killian panel presented ... Eisenhower had commissioned another top-secret strategic review. Entrusted to H. Rowan Gaither, Jr., of the Ford Foundation, who fell ill, it was completed under Robert C. Sprague a veteran consultant from the Killian panel) and such luminaries as William C. Foster, John J. McCloy, Frank Stanton of CBS, and Jerome Wiesner. They reported ...a crash program on R & D for defensive systems, a national fallout shelter program costing upward of \$25 billion,... Spy satellites proved successful beyond the most sanguine expectations of laymen(what Edwin Land and the technicians expected is unknown). ...During the same weeks the Kennedy transition team eagerly polled scientist, academic, and military and civilian strategists for their views on the shape of things to come ... By New Year's 1961,two U.S. spy satellite programs verged on brilliant success. Thanks to the energetic advocacy of Richard M. Bissell, Jr., of the CIA,... The International Telecommunications Convention of 1973, which possesses treaty status, regulated the use of comsats and radio frequencies. ...By 1963 the government supplied 88 percent of the entire Caltech budget, 66 percent of MIT's 59 and 56 percent of the

University of Chicago's and Princeton's and a 25 percent chunk of Harvard's and Stanford's.

Buderi, Robert.(1996). The Invention that Changed the World: How a Small Group of Radar Pioneers Won the Second World War and Launched a Technological Revolution.Simon and Schuster. Pg. 470.

"...For starters, with some two thirds of national defense contract R&D dollars going to sixty-eight corporations, and an astonishing 40 percent to only ten companies,... Roosevelt died before **[Vannevar]Bush** completed the Document ...Science-The Endless Frontier on to Harry Truman. It was a land mark document that formed a focal point in a lengthy congressional debate over the best method for distributing federal research funds and ensuring the scientific, technical, and economic prosperity of the Nation. ...The stalemate continued until a compromise was reached in early 1950. ...Capitalizing on their five-year head start, the armed services, led by the Office of Naval Research, became the main supporters of academic research and NSF's strength was diluted further by the emergence of the Atomic Energy Commission and NASA as additional funding sources."

Brown, Anthony Cave.(1982).Wild Bill Donovan. The Last Hero. Times Books. Pg. 802.

"...In 1948 Donovan was to find out for himself how weak the CIA had become. That year the secretary of defense, James Forrestal, invited him to **serve on a small secret committee consisting of Dr. Vannevar Bush**, Admiral Sidney Souers, and General Alfred M. Gruenther, to study the problems of defense against **unconventional attack** against the United states , including clandestine attack employing biological weapons, ..The subject was divided into **seven subjects for investigation: ...4. Certain special applications of psychological warfare(i.e., thought control or special mode, as it was called).**

Becker, Robert O. & Selden, Gary(). Body Electric. **"The establishment's attitude toward EMR (Electromagnetic Radiation) health effects are based on the work of Herman Schwan. Schwan was a professor in Germany during most of the Nazi era, who was admitted to the U.S. in 1947 and accepted a job at the University of Pennsylvania doing most of his research for the DOD(Department of Defense)."** Editor's note. Many scientists such as Dr. Schwan may have had a "need to know" security clearance. This is important to keep in mind because there are many examples of scientists working on parts of classified projects without knowing the whole picture.

Kaplan, Fred.(1983). Wizards of Armageddon. Simon & Schuster.

Pg. 189. "In 1949, a group of six Institute professors, including Bernard Brodie and Kaufmann, was hired by the social science division of the RAND Corporation in Santa Monica to do part-time work analyzing psychological warfare."

Kaplan, Fred.(1960?). Scientists at War The Birth of The Rand Corporation. American Heritage.

Pg. "By the Fall of 1947 the RAND staff had grown to one hundred and fifty. For anyone interested in some vague combination of mathematics, science, international affairs, and national security, RAND offered an ideal setting. There was an intense intellectual climate but no teaching obligations or boring faculty meetings. **There was access to military secrets but no military officers from whom to take direct orders."**

Szulc, Tad.(1975, Dec.). The Mind Readers and Other Tales of Science Fiction Research by the Pentagon's Think Tank. Washington Monthly. Editor's note. This article found in a very important congressional hearing, **a must read. Subcommittee on Constitutional Rights of the Committee on the Judiciary US Senate. (1976)Surveillance Technology Policy and Implications: An Analysis and Compendium of Materials. Pg.1036.**

"...As matters now stand, scientists from the Massachusetts Institute of Technology to the University of California and a dozen other famous schools are involved in ARPA research. Some of these scientists belong to a **highly exclusive, informal group known as the "Golden Fleece," men and women picked in the late 1950s by the Pentagon-funded Institute for Defense Analysis for some of the most esoteric and complex defense research. ARPA, upon its birth in 1958, immediately received the benefit of the talents of these "Jascons," as they are still called. ARPA officials says that some 20 "Jascons"-an elite, informal, almost secret group-are still at its disposal. Over the years, the "Jascons" have been holding quiet brainstorming sessions at hideaways around the country to feed ARPA ideas.**"

Science Against the People. Berkeley Sespa. **The Story of Jason-The Elite Group of Academic Scientists who, as Technical Consultants to the Pentagon, have Developed the Latest Weapon Against Peoples' Liberation Struggles: "Automated Warfare."**(1972) Pg. 3. "At the end of World War II many of the country's leading scientists, who had been involved in such war research as the atomic bomb and radar, left full-time government work and returned to the college campuses . The military, of course, did not want to lose all this valuable talent. In addition to it's own "in-house" laboratories, the Defense Department sought to establish ongoing consulting liaison with first-rate scientists. At first this service was obtained through the RAND corporation and some scientific advisory committees attached directly to the Pentagon; some scientist also consulted for industrial corporations working on defense contracts. The industrial consulting jobs did extremely well, but the scientists involved felt that they were not close enough to the center of power to influence policy decisions. On the other hand, scientists in Washington often felt restricted by the particular government agency they consulted for and also found the government consulting fee scales to be very low. Therefore, the idea of a new, independent research and consulting organization arose: **This was the Institute for Defense Analyses, IDA. Set up nominally as a private, non-profit corporation, IDA** worked on the basis of contracts with the Pentagon for particular research problems of interest to the military. IDA could determine its own salary scales and it hoped to attract high calibre scientists with the promise of considerable "freedom" of their choice of problem to be worked on. **A group of the very brightest young scientists was recruited into a sub-group of IDA called Jason.** The whole success of this enterprise depended upon establishing it as a mark of highest prestige to be invited into this elite group. **IDA's Cold-War Ideology.** The original political-philosophical outlook of IDA and Jason was boldly stated in terms of cold-war ideology. Their literature of ten years ago told of the creation of IDA as arising from "the inescapable realization that International Communism is imperialistic in nature and that its goal is no less than world domination." ..."Jason and the "McNamara Fence" **The most detailed public account of Jason's contribution to the Vietnam War is contained in the Pentagon Papers: the 1966 Jason summer study which gave birth to a new form of technological warfare, now known as the automated, or electronic battlefield.** ...Early in 1966, a clique of Harvard-MIT scientists with high level connections in Washington persuaded Defense Secretary Robert McNamara to sponsor a special study on "technical possibilities in relation to our military operations in Vietnam." With this prompting, McNamara formally requested the scientist to look into the feasibility of "a fence ...warning systems, defoliation techniques and area denial weapons." **This special scientific study group was assembled under the auspices of the Jason Division of IDA, the group of 47 scientists represented "the cream of the scholarly community in technical fields"..."a group of America's most distinguished scientists, men who had helped the government produce many of its most advanced technical weapons systems since the end of the Second World War, men who were not identified with the vocal academic criticism of the Administration's Vietnam policy." This Jason study group met during the summer of 1966, starting off with a series of briefings by high officials from the Pentagon, the Central Intelligence Agency, the State Department and the White House. They were given access to secret materials. ...thus we are drawn to conclude that the clique of top-level scientific advisors were instrumental not only in initiating the electronic battlefield ideas(1966), not only in helping the implementation of the system in Vietnam(1968), but also in extending this new warfare system to a world-wide capability(1970). ...The technological wing of the military-industrial complex does not necessarily win wars. We have seen that it certainly can help prolong them. ...Since most Jason work is highly classified, and it is customary to keep secret the titles and even the very existence of most highly classified reports, we can conclude that this information represents only the tip of the iceberg. ...One of the distant branches of the sensor development has been described by Joseph A. Meyer, a computer specialist working for the National**

Security Agency and funded by the Department of Defense ("Crime Deterrence Transponder Systems", IEEE Transactions AES-7 no. 1, January 1971): "A transponder surveillance system is based on three ideas. First, parolees, bailees, or recidivists will each carry a small radio transponder, which cannot be removed, as a condition of their release. This transponder will emit a radio signal which gives a positive and unique identification. Second, a network of surveillance transceivers will interrogate transponders in a neighborhood. Third, a realtime computer will receive the transponder reports, update location and tracking inventories for each subscriber, and control the surveillance process. Every subscriber must be accounted for at all times. ...For urban areas, a mesh of transceivers would scan the streets, communicating with central computers to provide a public surveillance network." Meyer goes on to discuss special problems: Harlem--"a high crime area"; group actions and large-scale confrontations; juveniles;etc. [Here is a list of Jason members, that were also mentioned elsewhere in this paper.] Princeton University and Institute for Advanced Studies Freeman Dyson ...**Kenneth Watson (Professor of Physics, UC, Berkeley) Watson was one of the group that founded Jason in 1959. At first they were thinking of forming their own private consulting company, but they finally decided to let IDA be their business manager; This avoided the problem of profits (taxes). There is usually a 6-week summer study session and then a couple of long weekend meetings during the school year. Government people come and outline problems they would like Jason to solve. Most of the work is for the Defense Department. The purpose of Jason is to supply purely technical information for the government; it is non-political. Jason has never taken a position on any subject, as an organization. We are just a group of individuals...** ...As to his personal attitude about the military, he said that since it is an \$80 billion budget he couldn't make a blanket statement.

Heims, Steve J.(1980). John von Neumann and Norbert Wiener. MIT.

Pg. 180. "While the high technology with which each was concerned led directly to weapons development, it suggested incidentally to both men similarities in principle between machines and organisms, particularly parallels between high technology and **the human nervous system.**"

Pg. 275. "In May 1953 von Neumann assumed the chairmanship of the nuclear weapons panel of the Scientific Advisory Board of the US Air Force...In May 1954, von Neumann had occasion to make a list of all the organizations to which he was a consultant, twenty-one in all, mostly government organizations but also some private companies. The latter included the Standard Oil Company, IBM Ramo-Wooldrigdge, the Rand Corporation.

Forman, Paul.(1987)Behind Quantum Electronics: National security as basis for physical research in the United States, 1940-1960. HSPS, 18:1.

Pg. 160. "Raytheon had particularly close ties to MIT: Vannevar Bush had been one of its founders..." Pg. 170. "During the 1950s the cumulative number of announced and available number of papers properly published in U.S. physics journals-about 50,000-but it was probably only some small percentage of the (unknown) number of **security classified reports in physics** and its technical applications prepared in that decade. Pg. 173. "As Marvin Kelly,President of Bell Labs, told the banqueting members of the American Physical Society early in 1957, "the ivory towered existence is no more...37" 37. "...Bell Telephone Laboratories were different only to the extent that 40% rather than 80% of their budget cam from DOD." Pg. 202. 87. "...Thus A. Abraham's massive Principles of Nuclear Magnetism(Oxford, 1961) is above all else, a treatise on quantum electronics." 88. "...at Bell Labs some 2000 scientists and engineers were engaged in war work;" 89. "...Similarly, "the tremendous advances in the fundamental investigation of paramagnetic materials...is in great part due to the existence of microwave equipment and techniques which were evolved during the war," Pg. 208. 103. ..."In June 1952 an Air Force spokesman implied that slightly more than half of the research sponsored by that service at universities and university-affiliated laboratories was classified, but that three-fourths of that classified research was performed in six institutions where classified research was segregated in affiliated laboratories;... Pg. 214. "In September 1959...a symposium on "Quantum Electronics-Resonance Phenomena,"... ..The Office of Naval Research,...realized the growing significance of the field of quantum electronics, which is actually producing a revolution in microwave techniques." Pg. 222. "...asking why those tilling the most fundamental of all fields of physics accepted such a "utilitarian and pragmatic, but fragmentary, concept of science with the consequent abandoning of its traditional aim of the unification of knowledge." In answer Cini, pointing particularly to the **Institute of Defense Analysis' "Jason" group**, and stressing that inclusion in this consultative elite functioned as a mark of scientific eminence among U.S. theorists, suggested that this drastic shift in epistemic goals "was not a mechanical adaptation [to] an environment...but an active identification of its own interests-in the widest sense-with the ...objectives...and the scale of values of the American society of those years by a leadership that came from within that environment."

Heims, Steven J. Cybernetics Group. MIT.

"Another group of physicists displayed their self-confidence after the war by invading the traditional domain of biology, proposing to unravel the code-script embodied in the genes as suggestion in Erwin Schrodinger's widely read book with the enticing title *What is Life?* (1944). A dedicated group of researchers who became known as the "phage group" formed around Max Delbruck and Salvador Luria and gathered in the summers at Cold Spring Harbor on Long Island: they were as narrowly goal-oriented as the designers of the atom bomb had been during the war. In this group young researchers obtained the training and orientation that eventually led to the discovery of the structure of the DNA molecule and creation of the new discipline of molecular biology."

Editor's note. There are many articles which show that scientists and the military were very interested deciphering the brain.

Halacy, Daniel S. Jr. (1960) *Bionics Science of Living Machines*. Holiday House.

"...Among the organizations that assisted are the Department of Defense and its individual services, Cornell Aeronautical Laboratory, Inc., Massachusetts Institute of Technology, the Applied Physics Laboratory of Johns Hopkins University, Stanford Research Institute, General Electric Company, Lockheed-California Company... ...**Dr. W.R. Adey** of the University of California at Los Angeles. Speaking of another scientific symposium in 1960, he said: "For collaborative engineering efforts to be fruitful, we would respectfully ask that the engineer first learn his biology." There were 30 speakers at the first Bionics Symposium, and about 700 in the audience representing engineers, physicists, mathematicians, psychologists, psychiatrists, biologists... They listened to papers typified by the following titles: ...Problems in Bio-Computer Design, What Good are Artificial Neurons?

Rose, Frank. (1984). *Into the Heart of the Mind*. Pg. 42.

"The Sloan Foundation is betting \$20 million that it can, and that should count for something. **The Sloan foundation is the less splashy of New York's two great automobiles philanthropies.** Unlike the Ford Foundation, it doesn't conduct its business in a plate-glass cube on East Forty-second Street. Its headquarters are in a very private office suite, thickly carpeted and painted a safe beige, high above Fifth Avenue in Rockefeller Center. **Nor is it in the habit of supporting causes that might be considered questionable or avant-garde. Throughout its fifty years of existence, Sloan has... Its interest in cognition began in 1970 with the decision to support the emerging discipline of neuroscience-the study of the brain. Seven years and \$15 million later, with neuroscience established as a respected academic endeavor, the officers of the foundation began looking around for something else to support. The neuroscientists suggested cognitive science. In 1976 the foundation announced that it was following their advice, and the race for funding was on.**

Editor's note. **The Brain Research Institute.** This is just one example of how the **same top scientists may know of or have developed the technology for classified mind control related research under professional organizations with strong government connections.** The researchers include Dr. West (New York Times, CIA behavior control experiments, see CAHRA website, human rights abuse report, prisoners.), Dr. Brazier, Dr. Adey, Dr. Pribram, Dr. Lilly (government work), Dr. Sweet (mind manipulation for political purposes, according to Professor Alan Schefflin), Dr. Frey (microwave hearing, See CAHRA Timeline). The UCLA Office of Sponsored Research (at 310-825-4031) contract Specialist on 2-17-98 stated the policy on classified research at UCLA. **For the last ten years UCLA has not and does not conduct classified research.**

Steneck, Nicholas H. (1984). *The Microwave Debate*. MIT Press. Pg. 86.

"So it was that the Air Force Systems Command, a primary recipient of most of the translated Soviet reports, contacted the head of the Brain Research Institute at the University of California, Los Angeles, for the purpose of calling a conference on **Neurological Responses to External Electromagnetic Stimuli**. The announced purpose of the UCLA meeting was to discuss scientific explanations that might account for a number of reports of apparent central nervous system and behavioral effects being received by the air force."

Pg. 84. "One year after the conference and Knauf's report, Soviet scientist traveled to the United States to attend the Fourth International Conference on Medical Electronics. The papers they presented plainly indicated that Soviet researchers, unlike their U.S. counterparts, were extremely interested in the consequences of **low-level, athermal effects, particularly on the central nervous system.** ...A.N.

Obrosof, noted that **Soviet scientists had been studying personnel effects since 1942.** ...If there were important discoveries to be made, the United States could not be caught napping, as it had been with the launch of Sputnik in October 1957. ...Translators working for the National Aeronautics and Space Administration, the air force, the army and Bell Labs in Whippany, New Jersey, began pouring through Soviet journals to find out just how much they knew about RF bioeffects. ...Lewis Bach ..."These reports have been going on for many, many years and I think we ought to ...on likely clues and likely lines and push them very hard to see if there is something or if there is not something..." ...Following the UCLA conference, the military, which controlled the RF bioeffects pursestrings and therefore made the major policy decisions, decided both to fish and cut bait. **Publicly talk of athermal effects was downplayed. Open contracts were not awarded for athermal or central nervous system studies, and in fact efforts were even made to keep information about central nervous system research from circulating too widely. Privately, however, the military and the State Department began work to try to determine whether there was any factual basis for a belief in the direct effect of RF radiation on human behavior and whether perhaps the Soviets had gotten the jump in exploiting such effects for espionage and military purposes."**

Brain Research Institute, UCLA. Third Annual Report. July 1, 1963 to June 30 1964.

Pg. 35. "...**Dr. Adey, with the association of Mr. Kado and Dr. Porter, developed a method of measuring impedance in brain tissue, providing an entirely new dimension in which to study the functional capacity of neural tissue.** Having been used extensively in animals, the method was used during the past year in assessing brain function of patients where, in general, comparable responses were obtained.

P 61. Conferences. "Conference on Speech, Language and Communication. Sponsored jointly by the United States Air Force Office of Scientific Research ...1963." Participants included ...**Lilly, John C. Communication Research Institute, Coconut Grove, Miami, Florida, Pribram, Karl H. Dept of Psychiatry, Stanford U., Sweet William H. Neurological Surgery, Adey, W. Ross.**

Pg. 64. Air Force Conference on Neurological Responses to External Electromagnetic Energy ...1963. Participants included **Frey, Allen W. Institute for Research State College, Pennsylvania, Institute of Defense Analysis, Ad Hoc Committee for Secretary of Defense McNamara.**

Pg. 71 Consultants or Advisors to State, Federal or International Agencies. International Brain Research Organization Council (Brazier...) ..Weizmann Institute, Israel-**Medical Electronic and Biocomputing** (Estrin).

Wright, Stephen. (1994, Jan. 29). Weapons of Control. New Scientist. Pg. 55.

"...Way back in 1970, US congressman James Scheuer commented that: '**As a result of spinoffs from medical, military aerospace and industrial research, we are now in the process of developing devices and products capable of controlling violent mobs without injury. We can tranquilize, impede, immobilise, harass, shock, upset, stupefy, nauseate, chill, temporarily blind, deafen or just plain scare the wits out of anyone the police have a proper need to control and restrain.**' The 1972 Security Planning Corporation report on nonlethal weapons to the National Science Foundation listed 34 different types using electrical, optical, acoustic, thermal, kinetic impact, chemical irritant and barrier devices to produce control effects. ...any of us might become future targets, since in reality these weapons will form part of the future's technology of political control.

Tigner, Brooks. (1996, April 7). Israel To Join EU in Tech Research. Defense News. Pg. 3.

"Israeli companies are preparing to join a broad range of strategic high-technology research projects funded by the European Union (EU) following an unprecedented accord signed last week between Brussels and Tel Aviv. ...Scientific and research contacts between Israel and the European Union date back to 1975 and include work on nearly 100 joint research projects in material engineering, opto-electronics and **neurosciences.**

Editor's note. This book is long so just skim to the area you are interested in! The purpose of this book is to show the interest in mind control, to show similarities to what the victims describe and the goals of military neurological researchers, to show the money invested in this technology and how classified it is. These are the main points. The following articles are **examples of the search in the 1940s by scientists for the basis of human consciousness and for its control.**

Heims, Steven.(1991). Cybernetics Group. MIT

Preface. "The subject of this book is the series of multidisciplinary conferences, supported by the Macy Foundation and held between 1946 and 1953, to discuss a wide array of topics that eventually came to be called **cybernetics**." Pg. 11. ...included several mathematicians (Norbert Wiener, John von Neumann), engineers (Julian Bigelow, Claude Shannon), a neuropsychiatrist (Warren McCulloch), and a polymathic genius (Walter Pitts). Some members of this group had proposed that their concepts useful in engineering and biology,... For lack of a better collective name we shall refer to this group as the cyberneticians, although they would never have used this term themselves. ..."Fremont-Smith[Josiah Macy Foundation] was so cautious that I got the impression he was anxious to keep something private- ...Much later I learned of the CIA involvement, **...(the Macy Foundation's records have not been open for researchers)**. At the Macy meetings, as the unedited transcript shows, the political conditions were discussed explicitly from time to time. **Some participants were government consultants who worked on "classified" topics kept secret from other researchers; their priorities were such that they skipped attendance at the conferences whenever the government called**. McCulloch described the situation at the beginning of the ninth meeting in 1952: I would like to say that two things have interfered with our gathering this time. One of those is an increasing source of anxiety to me...**Thing after thing that one or another person has wanted to discuss at this meeting has been locked up for "secret."** I have no idea how far that process will go in time to come. **I know that von Neumann had something he wanted to talk to us about and that it is secret. I know that some stuff that Bavelas wanted to talk about to us has become secret. And so it goes.** Pg. 251. "I looked up Bateson in Sea Life Park in 1968. I had written to him in connection with my interest in the history of the Macy cybernetics meetings. His response was, **"There is certainly a piece of scientific history to be dug out of these meetings-I believe more profound and dramatic than The Double Helix."** Pg. 256. "John Stroud, who also used cybernetics to give form to his personal metaphysics and synthesis, was a lively, active participant at the Macy meetings. Everyone at the conferences agreed he was a bright and talented young scientist, but a quarter-century after the meetings several participants asked me, "Whatever became of John Stroud?" ...He is something of a mystery figure. A McCulloch protege, ...He spent most of the rest of his working life as a civilian employee of **the U.S. Navy, his work hidden from the scientific community by the veil of military secrecy**."

McCorduck, Pamela.(1979).Machines who Think.P.46

"In 1942, at a meeting sponsored by the Josiah Macy Foundations in New York, Arturo Rosenblueth presented the ideas that would appear the following year in the Philosophy of Science paper. In the audience was Dr. Warren McCulloch of the University of Illinois Medical School, who had long been interested in the organization of the cortex of the brain. McCulloch, a neurophysiologist, had already begun working with Walter Pitts, a mathematician, on a mathematical description of certain neural behavior. In 1943, the same year that the Rosenblueth-Wiener-Bigelow paper would appear. McCulloch and Pitts would publish **"A Logical Calculus of the Ideas Immanent in Nervous Activity" in Bulletin of Mathematical Biophysics**....the paper goes on to describe a logical calculus and principles for constructing a class of computing machines that would permit the embodiment of any theory of mind or behavior ...their publication could well be taken as the birth of explicit cybernetics."

Editor's note. Here is just one of numerous similar articles.

"A Method for the Remote control of Electrical Stimulation of the Nervous System-E. Leon Chaffe, Professor of Physics, Harvard University, and Richard U. Light, Instructor in Surgery, Yale University School of Medicine. Yale Journal of Biology and Medicine Volume 7, Number 2 December 1934.

Editors note. I.I. Rabi may have consulted with the government to decode the brain. It is one of the many research leads to follow. I.Rabi worked for the MIT Radiation Lab to develop radar for World War II along with a who's who of physicists, Hans Bethe, Luis Alvarez, Ed McMillan, to name a few. Radar is a device that can detect invisible or distant objects by means of reflected radio waves and is capable of locating them accurately in space. He is known as the discoverer of Nuclear Magnetic Resonance in Molecular Beams.

"Isidor Isaac Rabi(The scientist in public affairs) has been Associate Director of the Radiation Laboratory of the Massachusetts Institute of Technology, and Chairman of the general advisory committee to the Atomic Energy Commission. He has been Higgins Professor of Physics at Columbia University since 1950, and is a member of the President's Science Advisory Committee. He was **awarded the Nobel Prize for Physics in 1944.**"

Calder, Nigel, editor. 1968. Unless Peace Comes, Scientific Forecast of new Weapons. Viking Press.

Ramsey, Norman.(1956)Molecular Beams.Oxford at the Clarendon Press.

"The molecular beam magnetic resonance was first introduced by **Rabi** and his associates (RAB 38 KEL 39) in 1938. ...Precision measurements of nuclear, molecular, and atomic properties began in 1938 with the introduction of the molecular-beam resonance method by Rabi and his associates (RAB 38,KEL 39). At first, the resonance method was applied to the measurement of nuclear magnetic moments only, but it was soon extended as a more general technique of radiofrequency spectroscopy initially by Kellogg, **Rabi**, Ramsey, and Zacharias (KEL 39a) in applications to molecules ...

Bar-Ilan University Press.(1996).Pioneers of NMR and Magnetic Resonance in Medicine: the Story of MRI. Pg. 567-8

Richard R. Ernst. Pioneer of Fourier-Transform NMR and Two-Dimensional NMR Spectroscopy and Imaging. "...improving the sensitivity of the technique tenfold or even hundredfold...Fourier transformation and pulse techniques, what is that? Let me try to illustrate it through an analogy. Remember first that spectroscopy is very much concerned with the detection of signals from a sample containing some compound. Assume that you are interested in finding out how well tuned a piano is. ...The traditional, "old-fashioned" way of doing this would of course be to hit each key in succession and record the frequencies-the signals from our sample if you wish. ...Now there is a much faster way of getting the same results: ...hit all keys at once. You have now performed a pulse experiment. ...But how could you possibly extract the individual tones from the cacophony? ...Fourier transformation. ...Savings in time can be used in another way, to increase sensitivity. To continue our analogy, ..."signals" from the [piano]strings barely audible about the background noise in the room. Now you could improve the detection of these weak signals by hitting the keys of this same piano 100 times every sixth second and adding the result. This would improve the signal-to-noise ratio tenfold... ...When Fourier transform NMR was introduced around 1970 it had a tremendous impact on the applicability of NMR technique to chemistry.

Cannon, Martin(1980?). The Controllers.Internet.

"...In his autobiography The Scientist, **John C. Lilly**....records a conversation he had with the director of the National Institute of Mental Health--in 1953. The director asked Lilly to brief the CIA, FBI, **NSA**, and the various military intelligence services on his work using electrodes to stimulate directly the pleasure and pain centers of the brain. Lilly refused, noting, in his reply: **Dr. Antoine Remond**, using our techniques in Paris, has demonstrated that **this method of stimulation of the brain can be applied to the human without the help of the neurosurgeon**; he is doing it in his office in Paris without neurosurgical supervision. This means that anybody with the proper apparatus **can carry this out on a person covertly, with no external signs that electrodes have been used on that person**. I feel that if this techniques got into the hands of a secret agency, they would have total control over a human being and be able to change his beliefs extremely quickly, leaving little evidence of what they had done."

Editors note. **Dr. Antoine Remond, Centre National de la Recherche Scientifique, Paris(France)** is on the Handbook Editorial Committee of the International Federation of Societies for EEG and Clinical Neurophysiology, 1978. **J Lilly, K Pribram** Dr. Adey and many other top scientists attended Brain and Behavior Conference in 1961 and many other similar conferences. **There are many research leads to follow**. A.S. Gevins, co-editor with Dr. Remond conducts eeg research funded by "Office of Naval Research, the Air Force Office of Scientific research..." The following articles demonstrate the active search to solve the mysteries of the brain and to develop this knowledge, continuing up to the present time.

Pribram Karl H. (1996)?.Rethinking Neural Networks Quantum Fields and Biological Data. Pg. 156-7.

"B. Multiple Personality "Personality" is a consistent pattern of responses to stimuli and situations. In QND, the personality of the stochastic filter is determined by the locally homotopic mappings of experience onto the neural domain and by the configuration of discontinuities between homotopic domains. **A conscious train of thought consists of a well-formed wave packet propagating within the neural domain in response to the combination of inputs from a number of sources, including the sensory apparatus and the outputs of other domains at various levels of abstraction**. When the probability density corresponding to this wave packet produces an expectation that does not compare well with the actual ensemble of inputs, the result is a potential field gradient (or "barrier", if it is sufficiently steep) that deflects the wave packet toward states associated with less prediction error. Suppose that when the network's personality is being formed, it experiences a deliberately consistent "diabolical" training in which certain common experiences are interrupted with frustrating or painful intervention. QND learning will encode the painful experience on the trajectory so that it will be properly predicted as a consequence of the prior

experience. (Incidentally, QND learning models classical conditioning even though it is simple Hebbian, because of the causal dynamics of the Schroedinger equation.) whenever the common experience subsequently occurs without the intervention of the diabolical agent, the extreme difference between the expected punishment and the benign experience drives the conscious wave packet away from the states where the pain was stored. This "avoidance" has two consequences, one obvious and the other subtle. The obvious effect is that the deflected wave packet will generate an **altered behavior pattern**. The subtle effect is that the neurons where the painful patterns are encoded will be prevented from receiving enough probability to allow the patterns to be corrected. Now suppose that the diabolical training is "extensive", both figuratively and literally. that is, suppose that it succeeds in placing other **avoidance patterns** into a geometry that surrounds and isolates a large cognitive domain from the rest of the neural network. Subsequently, wavepackets that form in that domain will be trapped there, and that domain will then develop a personality that is distinct from the personality of the exterior domains(s). But the entrapment is not permanent: **Quantum tunneling provides a mechanism for penetration of the barrier, after which another distinct personality emerges."**

Editor's note. Dr. Pribram is a Stanford University Professor, a very credible professional. The above excerpt was a quantum level description of multiple personality. (See Operation Mind Control by Walter Bowart, 1978 and 1995, Flatland Publishing for military involvement in this area of research). **This is very significant proof that the brain code has been discovered.**

Baker, CB. ELF Biological Warfare Upon America. Youth Action News. PO box 312 Alexandria, Virginia 22313.

"...neurophysiologist Karl Pribram has spent most of his career documenting the holographic model of the human brain. ...holography is a method of lensless photography in which the wave field of light scattered by an object is recorded on a plate as an interference pattern. when the photographic record --the hologram --is placed in a coherent light beam like a laser, the original wave pattern is regenerated. A three-dimensional image appears. ...Any piece of the hologram will reconstruct the entire image." Ken Wilbur[wrote Holographic Paradigm, 1982] described the work of the great quantum physicist David Bohm who "says that the hologram is a starting point for a new description of reality: the enfolded order. ...Also electron beams could do the same thing or sound waves could make holograms, any form of movement could constitute a hologram... ...Marilyn Ferguson[wrote Brain Revolution 1970?] who stated: "the holographic supertheory says that our brains mathematically construct 'hard' reality by interpreting frequencies from a dimension transcending time and space. The brain is a hologram. Michael Talbot [wrote The Holographic Universe, 1991] "Any wavelike phenomena can create an interference pattern, including light and radio waves... ...described the work of an eighteenth century Frenchman named Jean B.J.. **Fourier who "developed a mathematical way of converting any pattern, no matter how complex, into a language of simple waves. He also showed how these wave forms could be converted back into the original pattern."** ...could be achieved mathematically,...Fourier transforms...These enable the Nobel Prize winner Dennis Gabor (in 1947) to convert a picture of an object into a blur of interference patterns on a piece of holographic film. ...**In 1979, Berkeley neurophysiologists Russell and Karen DaValois discovered that the human brain utilizes Fourier mathematics--"the same mathematics holography employed--to convert visual images into the Fourier language of wave forms."** Other scientists "discovered that the brain's visual cortex was responding not to patterns, but to the frequencies of various wave forms." Another group of scientists had discovered that "the human ear was a frequency analyzer" and that our "our skin was sensitive to frequencies of vibrations."

Adey W. Ross, Proctor, Lorne, Technical Editors.(1964, Oct29-30). **Symposium the Analysis of Central Nervous System and Cardiovascular Data Using Computer Methods.** Washington, D.C.NASA

Contents... Visually-Evoked Potentials Recorded Transcranially in Man. ...Antoine Remond. ...Concepts of Cerebral Organization Arising from Time Series Analysis of Neurophysiological Data...W. Ross Adey. ...Frank Ervin."

Editor's note. And yet another lead to follow, Alan Gevins, electroencephalography, President SAM Technology, Inc. San Francisco, CA. Gevin is listed as a Contributor to the 1996 USAF SAB which contains the drastic predictions of electromagnetic weapons on humans(see CAHRA website, Intelligence Tools). He also authored the article Obstacles to Progress in 1987 EEG Handbook Volume 1 p 668 and makes a telling comment. "...Another line of advanced research which may temper the strict epiphenomenalist view suggests that **low-intensity, low frequency electromagnetic fields have the capability of influencing the metabolic activity of individual neurons (see review in Adey 1981).** If so, such fields could play a significant role in mass neural information processing.

Lawrence Albert & Adey W. Ross. (1982) Nonlinear Wave Mechanisms in Interactions between Excitable Tissue and Electromagnetic Fields. Neurological research, Vol. 4 Number 1/2 p 115.

"It is now well established that intrinsic electromagnetic fields play a key role in a broad range of tissue functions, including embryonic morphogenesis, wound healing, and information transmission in the nervous system. These same processes may be profoundly influenced by electromagnetic fields induced by an external force. **Tissue exposure to extremely low frequency (ELF) and ELF-modulated microwave fields at levels below those inducing significant thermal effects has revealed highly nonlinear mechanisms as a basis for observed effects.** ...A model is proposed for interaction between excitable tissue and electromagnetic fields, based on nonlinear waves in the cell membrane, with ionic interactions as an essential step."

Mackay, Donald. (1980). Brains, machines and Persons.

"One of the most powerful computational techniques for extracting significant information from brain signals is called 'cross-correlation'. To take a simple example from the work of one of my former colleagues, Dr. D.M. Regan, a flickering light in front of a patient's eyes elicits a weak flickering electrical response from the brain. Often this is less than one millionth of a volt in strength, as recorded from the scalp, and so is normally swamped by the background of general brain activity (typically 10 to 50 millionths of a volt in strength). Dr. Regan devised a simple analogue computer system to multiply together the signal controlling the flickering of the light and the mixture of signals from the brain. Cross-multiplying, followed by averaging, has the effect of steadily enhancing any brain signals that are in step with the flickering input, and averaging out those that are not. As a result, even the feeble responses to flickering light from a nervous system damaged by multiple sclerosis can be easily measured.

Jastrow, Robert. (1981). Enchanted Loom. Simon & Schuster.

"...This research has barely started, but the pace of the progress is astonishing. In one recent experiment, scientists attached electrodes to the rear of a subject's skull, just above the brain's center of vision. They discovered that this region emitted different electrical patterns, depending on what the subject was looking at. Circles, squares or straight lines—each had its special pattern of electrical waves. In another experiment, scientists detected a special signal that seemed to signify excitement or elation, coming from the seat of feelings and emotions in the brain. Looking at these electrical records, the scientist can tell something about the thoughts and feelings in a person's mind, and the impressions that are passing into his memory.

Rose, Frank. (1984). Into the Heart of the Mind. P. 189.

"...in which NASA cosmologist **Robert Jastrow** foresees the day when brain scientists will be able to dump contents of the mind directly into the circuitry of an electronic computer.

Macay, Donald M. A Mind's Eye View of the Brain. Cybernetics of the Nervous System. Volume 17. Elsevier.

"...Few scientists have been more successful than Norbert Wiener... **...The time-honoured problem of relating mind and brain has recently received a new twist with the evolution of artifacts capable of mind-like behavior.** ... "I am greatly indebted to the RAND Corporation for assistance in transcribing the talk, given in their Santa Monica Laboratories,...

Wiener, Norbert. (1965). Cybernetics of the Nervous System. Schade Elsevier.

"...The big new principles in the field of physics were slowly being contemplated. Men like Wiener searched for basic concepts, like the random distribution of matter, **and relation of matter and electromagnetic radiation**, the quantum state of energy in matter, relativity, etc. ...In this early period of Wiener, culmination with his production of the book **The Fourier Integral and Certain of its Applications in 1933**,... ...Another consideration of Wiener at this time was the phenomenon of **harmonic analysis of particles**. This is related to the study of Brownian motion, and is the natural outgrowth from quantum mechanics' representations of matter in the form of wave functions. With harmonic analysis this clearly is Wiener's earliest work into 'rhythmic systems.' This would later come to dominate all his work, and he stressed the importance for **neurophysiology**. **...a statement by the Russian neurophysiologist A.V. Napalkov. "We believe that new research methods, engendered by the development of cybernetics lead to a radical change in the methods which so far have been used in the study of the brain.** ...In Wiener's belief the property of brain waves is one of **highly specific microradiation**. **...Dr. Wiener find that his ideas about specific types of radiation associated with nucleic acid complexes randomly scattered within neurons, when applied to encephalography should bring about productive results.** "Encephalography has been too

much in recognizing wave patterns subjectively. Too little has been done for determining what actually happens there....We have not done enough work making **atlases of frequency distributions**...This method is looking for specific numbers."

Wiener, Norbert. Rhythms in Physiology with Particular Reference to Encephalography.

"...I am not a physician, I am a mathematician. ...In this lecture I have intended merely to give you a general idea of what my concepts are concerning brain waves. Research work in this line is under way at several places; it is going on in the laboratory of Dr. Lindsley and Dr. Gray Walter, and I hear that an interest in this field is developing in Germany and Russia.

Editors note. Top scientist such as **Wiener and Dr. Mary Brazier of the UCLA Brain Research Institute** and many others, worked or collaborated together and with the same government and private funding. This is where to look for mind control research. The following article states one problem in deciphering brain signals. But current technology could overcome this obstacle.

McCulloch, Warren S.(1965).Embodiments of Mind.M.T.T. Press.

P v. "There are two kinds of goals directing the current arts of artificial intelligence(AI), parallel distributed processing(PDP), and the hard-wired nets that process images or sounds. The first are products that are useful to industry and the military. This pays for the research. ...**Signal-to-noise relations limit considerably the observations that can be made on a living system.** ...When Warren, Walter, Pat Wall, and I came to MIT, it was with the aim of marrying **physiological data to advanced speculation on how a nervous system works.** ...Wiener's letter at the end of three weeks was a lively diatribe on **noisy nonlinear systems** that were clearly designed to frustrate right-thinking analysts. ...McCulloch and Pitts ...1943 paper which provides for the first time a set of mathematical instruments sufficiently powerful for the conceptual description... and the investigation of the frog's visual system that culminated in the brilliant experiments... [McCulloch] still held that in the end there would be an **algorithmic description of the processes that engendered what "perceptual" operations** we found. ..The **retina is a machine**... logical gates but **more complex analog processors.**" Pg.3. "...in 1952, I went to the **Research Laboratory of Electronics of the Massachusetts Institute of Technology to work on the circuit theory of brains.**"

Pg. 230. J.Y. Lettvin, H.R. Maturana, W.S. McCulloch, and W.H. Pitts. (1959). What the Frog's Eye Tells the Frog's Brain.IRE.

"This work was supported in part by the ..USAF Office of Sci. Res, ...US Navy(Office of Naval Res.); and in part by Bell Telephone Labs, Inc. Editor's note. This is a very important and interesting paper.

Pg. 216. "McCulloch, Warren S. M.D. Since 1952 Dr. Warren S. McCulloch has been a staff member engaged in the Research Laboratory of Electronics at the Massachusetts Institute of Technology. ..is also well known as one of the founders of the group who have developed Cybernetics. He was Chairman of the Macy Conference on Cybernetics during its life from 1946 to 1951.... ..But Gentleman the title of my paper is not facetious. At the **behest of the Mathematical Sciences Division of the Office of Naval Research(ONR), I spent two months abroad, questioning "Where is fancy bred?"** ...Dr. Sem Jacobsen spoke well, but gingerly, about implanted electrodes;...hostility ..in the press and lost him financial support for implanted electrodes...has made trouble for Dr. Sherwood[in England] But France is a Catholic country. ..facilitated the work in New Orleans and at Rochester. Percival Bailey, who was one of the first to implant electrodes keeps his copy of the Pope's letter in his desk. In Boston Jim White and **Bill Sweet** have just been blessed, not merely for implanted electrodes, but...So much for implanted electrodes. **They are here to stay. Through them we will record activities in structures heretofore inaccessible,** locating the womb of Fancy. ...But let us get back to Salpetriere, where there were many good anatomic and psychologic papers. But the work **of Antoine Remond was the crowning success of the meeting. Long years ago he had come to my laboratory in Chicago...** combined with accumulators that let him use hundreds of repeated stimulations and so raise the signals way above the noise. **The resulting maps of the first special derivative on the surface of the head are impressive. To go from these to the second derivative, which locates the nervous activity as well as possible, is still done by a laborious longhand computation.** ...Today it can be done electronically, ..It may take three years to build the **gadgets. Remond's work was so impressive that the National Institutes of Health and the European Office, Air Research and Development Command, are now backing it financially,** but I understand that Bugnard and Alajouanine are of the opinion that it will raise the envy of those who have done nothing new. ...**John Lilly** failed to show, and I , as his fellow-American, was commanded to speak on a mathematics suited to neurology. ...Between visits to laboratories and lectures to theoretical physicists, engineers,

psychiatrists, and physiologist, I found time to work with **Sherwood on the third component of the Laplacian of the cerebral cortex**. ...But my principal business in England was the study of artificial intelligence. ...When I reached the National Physical Laboratory for Uttley's symposium on "**The Mechanization of Thought Processes**," ...But what I saw in Russian faces was that their scientists, like ours, know they are confronted by the problem of the Rabbi of Chelm with his Golem,...**The vigil must be endured, even if it entail "Q" clearance.**{Q is a national security clearance.} ...On the landing here, I made my bow to ONR and began to contact my Human Factors friends in Astronautics. They could use these circuits. ..Let me recapitulate its discoveries. 1. **For the good of patients, implanted electrodes are here to stay; and through them, whether psychiatrists like it or not, we will learn where fancy is bred."**

Jeffress, Lloyd A.(1961), Facsimile of the 1951 Edition). Cerebral Mechanisms In Behavior. The Hixon Symposium.Hafner Publishing Co.

"Members of the Hixon Symposium...Warren S. McCulloch, John von Neuman, Linus Pauling...the Hixon Fund was established in 1938 by a grant to the California Institute of Technology ...to support scientific endeavor which offers promise of increased understanding of human behavior.

Editor's note. This article demonstrates the continuing research for figuring out the process of sight, the same line of research based on the same theory, over twenty years later.

Marsh, Alton K.(1979, Jan.29).Special Report: US Air Force; Research and Development: Changing Patterns USAF Studies Arming Weapons Vocially. Aviation Week. Pg. 239.

"...If you could pull off the brain waves through sensors in a helmet," laboratory commander Col. Roy L. DeHart said, "just the thought wave could be used to activate various devices on the airplane by the turn of the century. I'm implying the pilot could call up switching, or select things[such as head-up displays] through thinking about it". ...**Fundamental visual process research, headed by Capt. Arthur P.Ginsburg and Mark W. Cannon, is aimed at providing a mathematical description of man's visual capabilities.**

Editor's note. For many reasons, most scientists have not protested scientific research for military purposes. Here are a few who did.

Gray, Chris Hables.(1997).Postmodern War.Guilford Press.

Pg. 234-5"...**Norbert Wiener, ...did substantial war work at MIT, but by the end of 1946 he said..."I do not expect to publish any future work of mine which may do damage in the hands of irresponsible militarists". Pg. 237. "Or Prof. Joseph Weizenbaum of MIT, who has called on computer scientists not to do vision research since it is framed by military priorities."**

Editor's note. People do make a difference. Here is another example from Gray. Pg.255-6. "...a woman named Katya went into the Vandenberg Air Force Base and smashed some computers for the Navstar system, part of World War IV command-and-control network set up by the Pentagon with secret Black Budget funds. The economy of punishments paid her back with three years in a cage to try and forge the link in all our heads: protest=prison. **She has moved to subvert such an equation by earning early release and then graduating from Harvard Law School."**

[Contents](#)

Chapter Seven

Sensors technology has been highly classified and billions of tax dollars were spent for its development during the Vietnam War. The U.S. military and corporations then sold this technology to Europe. Many parallels to mind control technology can be drawn. The importance and funding of bionics, replacing man with electronic eyes and ears, to the military can be seen in the following examples. Sensors development is like the development of the atomic bomb. It is a science-corporation-military-government bureaucracy which has national security classification, no accountability, massive funding and military goals to develop lethal technology. This cold war bureaucracy rationalized government radiation experiments in order to defeat the diabolical communist enemy. Sensors technology has been found guilty of the similar crimes. Now mind control victims are alleging the same problems. This is how the unthinkable can happen, how something horrible like radiation experiments and now mind control experiments happen.

Sensors technology is a part of the revolutionary change in military thinking. Technology has and is

changing the nature of war. The use of sensors and the electronic battlefield in Vietnam was a turning point for waging wars. Many analogies to mind control technology development can be drawn from this example. It is clear that the political will at that time and today, favors the military-corporation goals. It becomes clear that mind control experimentation could take place and with the approval of top officials. The role of secrecy, the interest of the military to develop high technology and the serious implications of a lack of oversight are all contributing factors to the **proliferation** of sensors and now mind control technology.

Barnaby, Frank.(1984). Future War Armed Conflict in the Next Decade.Facts on File Publications.

Pg. 72 "...On the battlefield of the future, enemy forces will be located, tracked and targeted almost instantaneously through the use of data links, computer assisted intelligence evaluation, and automated fire control. With first round kill probabilities approaching certainty, and **with surveillance devices** that can continually track the enemy, the need for large forces to fix the opposition physically will be less important. I see battlefields on which we can destroy anything we locate through instant communications and ..." This version of the **automated battlefield was described as long ago as 1969 by General W.C. Westmoreland, then Chief of Staff, US Army. The General based his statements on his experiences of new war technologies in the Vietnam war. Like most wars in the Third World, the Vietnam war was used enthusiastically by military scientists to test their new inventions under operational conditions."**

Pg. 74. "Sensors. A sensor is a device used to detect the presence of matter or energy and locate it. The sensors on the automated battlefield may be sensitive among other things to light, sound, magnetic fields, pressure and infra-red radiation. They can transmit information about enemy forces by radio over long distances."

Barnaby, Frank & Huisken, Ronald.(1975).Arms Uncontrolled. SIPRI.

Pg. 60. The Automated Battlefield. ...The sensors on the automated battlefield can be sensitive either to the same physical stimuli as the human senses, for example light or sound, although usually with greater sensitivity, or to physical stimuli which is not directly detectable by a human being, such as infrared radiation, magnetic fields, electromagnetic waves, and so on."

Editor's note; For more information, see World Armaments and Disarmament SIPRI Yearbook 1974. Chap. 11. Here is a list of some sensors **available in 1975. Acoustic seismic, radiofrequency, magnetic, chemical radar and infrared.** Homing devices(infrared seeking and radar-seeking, laser guided and television cameras were also available at this time. The **above book also quoted General W.C. Westmoreland..."Currently we have hundreds of surveillance, target acquisition, night observation and information processing systems either in being, in development or in engineering. These range from field computers to advanced airborne sensors and new night vision devices...** SIPRI goes on to say "...The fully automated battlefield as envisaged by General Westmoreland...should probably not be anticipated, at least on such a scale, for some time to come. **"The main concern in the recent public debate has been focused on the possibility that indiscriminate use of weapons might follow from the introduction of automated battlefield systems."**

U.S. Senate, Electronic Battlefield Subcommittee of the Preparedness Investigating Subcommittee of the Committee on Armed Services, Wed. Nov. 18, 1970 Pg. 1-5.

Senator Cannon. "...I want to make it very clear at the outset that the electronic battlefield program is not a clearly definable program as such. This term is used as the most readily available phrase to describe the many and varied types of equipment whose mission is to detect and locate enemy troops. ...Essentially, the key area of interest that gave rise to this inquiry was the development and use of sensor surveillance equipment which constitutes a new technique and innovation in locating enemy forces in South Vietnam. **Former Secretary of Defense McNamara made the decision in 1966 to place in operation a military concept known as the McNamara Wall.** Although this concept was never fully implemented, it did lead to the development and production of many types of sensor devices. These sensor devices were placed in operation in Vietnam on a very high priority basis. ...I do want to make one thing very clear to all the witnesses who will appear before this subcommittee. **...we do not want nor will we entertain any testimony that would jeopardize the safety and security of our forces or operations in Vietnam....we will receive this testimony later in executive[closed, classified]session.** ...General Deane. ..."I personally think **it has the possibility of being one of the greatest steps forward in warfare since gunpowder.** ... There has been a lot of misinformation about this program on the floor of the Senate because we have not been able to release information that has been properly very highly classified.

Statement of Maj. Gen. John R. Deane, JR, USA Director, Defense Communications Planning Group[DCPG]. "...I welcome the opportunity to report to you regarding the activities of DCPG. I shall briefly cover the history of DCPG; the sensor-aided combat surveillance systems... ..DCPG Established. In August of 1966, a scientific group known as the **JASON Committee proposed** to the Secretary of Defense a concept for inhibiting enemy troop and supply infiltration into South Vietnam by means of an air-supported barrier system, supplemented, of necessity, by a conventional barrier system. These systems basically called for the use of electronic sensors to detect enemy personnel and vehicles...

Editor's note. Please see article under section six for more information on the Jason group.

SESPA(1972). Science Against The People. The Story of Jason. Pg. 18.

"...Extracurricular Activities. A number of Jason scientists also involve themselves in the interaction of science with politics through non-governmental organizations. Drell, Goldberger, Glaser and Townes are all leading figures in the **Federation of American Scientists (FAS)**, a 26-year old group of liberal, establishment scientists which tries to influence government policies on weapons development through Congressional lobbying. In a recent mailing, FAS Chairman Goldberger[a Jason member] asks scientists to "join with us in asking the Administration for a full accounting of past and present Executive Branch actions" concerning work on weather-modification in Vietnam and elsewhere. ...SESPA would ask FAS whether they also judge American pioneering in the use of the automated battlefield to be an intolerable misuse of science, and whether the many former (and current) Jason and PSAC people in the FAS should be expected to cooperate in a "full disclosure" of these and other weapons they have studied for the military.

SESPA (1971, Jul).

Pg. 28 "Electronic Battlefield, Inc. by Chris Robinson ...article describing the Pentagon's development of the electronic battlefield. Utilizing sensors systems... **Companies involved include RCA, Westinghouse, Hughes, Honeywell, General Electric, Litton, Motorola, and ITT."**

SESPA(1973,Jan.).

"Humint" (human intelligence) seeks to detect people by amplifying their heartbeats and eyeball reflections."

Dickson, Paul. (1976). The Electronic Battlefield. Indiana University Press.

Pg. 37. "Anyone collecting bizarre weapons, weapons concept, and associated equipment will find the Vietnam era to be an especially fertile time for such things."

Pg. 41. "People sniffers-these pieces of equipment, which are more properly designated Aircraft Mounted Concealed Personnel Detector, were built to pick up ammonia in human sweat and urine as well as engine exhaust. ...proved invaluable in detecting the unseen enemy.

Pg. 42. "Ground target radars-....an important class of item in the overall collection were small ground target radars that were not too different from the older and larger models that saw service in Korea."

Pg. 72. "And if the Westmoreland speech served to give the electronic battlefield formal expression as a new military dream, the three-day, officially secret National Security Industrial Association (NSIA) symposium on the same concept showed it was becoming a contractor's dream as well. Some 850 industry representatives with secret clearances were seated for the meeting at the National Bureau of Standards in Gaithersburg, Maryland. Meanwhile an additional 1,450 were turned away due to the lack of space."

Pg. 102. "Finally on July 6, 1970, Congressional inattention was interrupted when Senator William Proxmire said, "Mr. President, I rise today to point out a classic example of the Pentagon's 'foot in the door technique,' one of the main reasons why the military budget is out of control. I am informed that **the Pentagon has already spent some \$2 billion on a secret weapons system called the electronic battlefield...**" Congressional control- ...information on this program had been kept from Congress and its costs hidden within the Defense Department budget request.

Pg. 116. "...the program attracting more than the **\$3.25 billion** in appropriations uncovered by the Subcommittee...Proxmire and the Subcommittee agreed, however, **that the electronic or automated battlefield represented a whole series of technologies and programs that were combining to form a totally new American way of war**, and that the investigation had only touched on one part of the whole. In other words it was a classic tip of the iceberg situation that seem to be begging for deeper examination...

Pg. 118. "While the misplaced millions paved the way for DCPG's dismantling, its actual demise was ordered by Congress when it began moving into new realms. ...Deputy Defense Secretary David Packard ordered the group to expand its activities from Southeast Asia,... **to the rest of the world, especially Europe.** Neither Packard's order nor an April change in the name of the group to Defense Special Projects Group (DSPG) were reported to Congress.

Pg. 122. "Having had great impact on the technology of jungle war in general and on the Southeast Asian War in particular, DCPG was given one more major job before going out of business. Under the specific orders of Secretary of Defense Melvin Laird, DCPG began work on a project with the code name Mystic Mission at the beginning of 1971. the goal of Mystic Mission was to get the sensors and related equipment into improved, streamline shape for their European debut. ...\$17 million bill for the Mystic Mission preparations..."

Pg. 130. "Formed in 1963, the Crows act as a booster group for electronic warfare (EW), which is that rich collection of esoteric equipment used to electronically detect, mislead, and evade enemy weapons efforts. They enjoy an almost legendary reputation in military circles for what they and their network of chapters have **accomplished in creating a strong and burgeoning market for EW hardware.** Like the Crows, the nascent Cricket Society[formed in 1974 to promote sensor technology] is open to people from government and industry and will have chapters dotted across the country.

Pg. 169. "**He added that if I was hoping to write about "the automated battlefield in the large sense of the word" than I would hit a lot of dead ends marked secret, and that I would be lucky if I got a hint of what was going on. ...the electronic battlefield has already dwarfed most other huge Federal efforts and should soon be in the price class of the Apollo Program for space exploration. ...This is a "revolution in conventional warfare" talked about by Pentagon planners that will usher in abilities that existed only in science fiction magazines a few years ago.**

Pg. 174. "**There are others, but none is more intriguing than the "death ray" application first put to use by the likes of Flash Gordon and Buck Rogers in their scrapes with the forces of evil. Although few effort are so heavily wrapped in secrecy, enough is known to conclude that "high energy lasers loom very large in the military scheme of things.**

Pg. 206. "**The only major, sustained effort to educate the public about the electronic battlefield has been by NARMIC**[National Action Research on the Military Industrial Complex, a branch of the American Friends Service Committee based in Philadelphia.] Its major effort at public education in this matter began in 1972 with the production and distribution of some 1,300 copies of a filmstrip and script entitled "The Automated Air War," which concentrated mainly on Igloo White. It was widely shown in the United States, Canada, and Europe. The NARMIC expose is a well-documented, strong condemnation of the electronic battlefield innovations used in Southeast Asia."

Pg. 208. "The "Winter Soldier" hearings staged in 1972. ...Eric Herter, grandson of the former Secretary of State Christian Herter which said in part: We have been participants in the new forms of war that are to replace the unpopular struggle of infantry and patrol against guerrilla bands. Replace it with a greater atrocity than a hundred My Lai: the systematic destruction of thousands of innocent persons, of entire cultures by an automated electronic and mechanical death machine whose killing will be one-sided, unseen and universal..."

Pg. 212. "**The plans are drawn, the multibillion-dollar down payment has been made, parts of it have already been tested in real war, and the rest of the wiring is going in right now."**

Chapter Eight

This chapter is about targeting whole populations with electromagnetic mind control. Distinguished government officials state unequivocally that it can be developed and there have been many rumors over the years reported in major newspapers. The goal of controlling man for political purposes continues. Scientists at the top of their field such as Dr. Wiener, of MIT and Dr. W. Ross Adey of NASA & UCLA are cited in articles concerning mind control. Here are a few of the many examples.

Calder, Nigel. 1965. The World in 1984 Vol 1 & 2. Penguin Books.

Notes on Contributors. **"Nigel Calder has been editor of New Scientist since 1962. Educated at Cambridge he worked for two years as a physicist for Mullard Research Laboratories before joining the staff of new Scientist at its inception in 1956."**

p. 181. How to Wreck the Environment by Gordon J.F. MacDonald, United States. **"Professor MacDonald is associate director of the Institute of Geophysics and Planetary Physics and Planetary Physics at the University of California, Los Angeles. ...He is a member of President Johnson's Science Advisory Committee."**

"Brain Waves around the World? ...The enhanced low-frequency electrical oscillations in the earth-ionosphere cavity relate to possible weapons systems through a little-understood aspect of brain physiology. Electrical activity in the brain is concentrated at certain frequencies, some of it extremely slow, a little around five cycles per second, and very conspicuous activity (the so-called alpha rhythm) around ten cycles per second. Some experiments have been done in the use of a flickering light to pull the brain's alpha rhythm into unnatural synchrony with it; the visual stimulation leads to electrical stimulation. There has also been work on direct electrical driving of the brain. **In experiments discussed by Norbert Wiener, a sheet of tin is suspended from the ceiling and connected to a generator working at ten cycles per second. With large field strengths of one or two volts per centimeter oscillating at the alpha-rhythm frequency, decidedly unpleasant sensations are noted by human subjects."**

"The Brain Research Institute of the University of California is investigating the effect of weak oscillating fields on human behavior. The field strengths in these experiments are of the order of a few hundredths of a volt per centimeter. Subjects show small but measurable degradation in performance when exposed to oscillating fields for periods of up to fifteen minutes."

"The field strengths in these experiments are still much stronger, by a factor of about 1000, than the observed natural oscillations in the earth-ionosphere cavity. However, as previously noted, the intensity of the natural fluctuations could be increased substantially and in principle could be maintained for a long time, as tropical thunderstorms are always available for manipulation. The proper geographical location of the source of lightning, coupled with accurately timed, artificially excited strokes, could lead to a pattern of oscillations that produced relatively high power levels over certain regions of the earth and substantially lower levels over other regions. **In this way, one could develop a system that would seriously impair brain performance in very large populations in selected regions over an extend period."**

"The scheme I have suggested is admittedly far-fetched, but I have used it to indicate that rather subtle connections between variations in man's environmental conditions and its behavior. Perturbation of the environment can produce changes in behavior patterns. Since our understanding of both behavioral and environmental manipulation is rudimentary, schemes of behavioral alteration on the surface seem unrealistic. No matter how deeply disturbing the thought of using the environment to manipulate behavior for national advantage is to some, **the technology permitting such use will very probably develop within the next few decades"** **"Author's note: ...I am grateful to J. Homer and W. Ross Adey, of the Brain Research Institute of the University of California at Los Angeles, for information on the experimental investigation of the influence of magnetic fields on human behavior."**

References. **"Wiener, N., Rosenblueth, A., 1946: "The mathematical formulation of the problem of conduction of impulses in a network of connected excitable elements, specifically in cardiac muscle", Arch.Inst. Cardiol. Mex. 16 (3-4) 205-265.**

p. 21. Dynamical Systems in Physics and Biology by Professor **Norbert Wiener, Department of Mathematics, Massachusetts Institute of Technology.** "...It is becoming abundantly clear that the nucleic acid complexes not only play a fundamental role in genetic memory, but that they probably play an analogous role in nervous memory. ...Dr. Edmond Dewan of Brandeis University and the Massachusetts General Hospital has pointed out to me that the disorganization of the nervous system which is found in schizophrenia and other mental diseases may not be entirely independent of the type of genetic disorganization which occurs in cancer."

"In connexion with nervous memory and the role of the nucleic acid complexes, I think it is quite possible that the memory properties of such complexes may be used in machines which need an artificial memory and that, just as we have the peak of the technique of solid-state physics, so that the next generation will see the use of nucleic acids as valuable engineering materials."

"In any case, I am reasonably confident that the studies of dynamical systems which I have mentioned are relevant to problems of biological organization. **The apparent role of the nucleic acids in the nervous**

system is going to lead to a new neurology in which long-time storage of information will probably be largely dependent on the nucleic acids or associated compounds. The nervous system will have to be regarded more and more, not as a static network, but as a network which is alive and changing its internal configurations with experience....Still we cannot treat it as if it were a computing machine network fixed for all time, and we shall have to consider the interplay of what Professor Francis Schmitt of M.I.T. calls 'dry' neurophysiology, dealing with the established nervous network, and 'wet' physiology, which is going to centre more and more about the nucleic acids."

"With an ever increasing understanding of memory and its mechanism, psychology, which has been largely a phenomenological science, is going to become more and more tied up with neurophysiology. Many other considerations which have up to the present been situated in a somewhat shameful background, **such as the study of direct communication at a distance between nervous systems, possibly by some sort of radiative phenomenon**, are going to be subjected to a real trend in scientific examinations which will not be corrupted by the unscientific assumption that we are dealing with phenomena with no physical correlates."

"...**The taking of signals in and out of the body higher up in the nervous system than in our sense organs and muscles, by the amplification and manipulation of nerve impulses, is well under way in work conducted jointly by members of the Massachusetts General Hospital and M.I.T.** This bids fair for the development of artificial limbs which can be used in a thoroughly voluntary way by the employment of existing nerve channels and with a **minimum distortion of the personality.**"

Editor's note. Please see Dr. Robert Beckers books, Crosscurrents and Body Electric for details on the U.S. GWEN Ground-Wave Emergency Network and his opinion that it has potential for behavioral and cognitive alterations. See Dr. Nic Begich and his book Angel Don't Play This Haarp on the U.S. HAARP and his belief that it could be used for mind control. Please see CAHRA website, Timeline 1976 for description of the Russian woodpecker radio signal broadcast over the United States. See also CAHRA website International Documents for UN documents describing this technology in 1975 and Russia's request to ban these weapons. See also CAHRA website, Nonlethal weapons in which both sides officially deny the existence and development of psychotronic and radio-frequency weapons in separate 1980 and 1990 news articles!

There are many professionals over the years who warn that there are behavioral effects from signals generated between Russia and United states since the 1960s, as far as is known. The U.S. and Russian governments are concerned about electromagnetic weapons as the documents state clearly. More research and freedom of information act requests are needed. Below are the published rumors on this technology.

Anderson, Jack.(1972, May 10).'Brainwash' Attempt by Russian? Washington Post. B15.

"Hidden in the Central Intelligence Agency's most secret files is an account of a possible Soviet attempt to "brain-wash" our embassy personnel in Moscow with mysterious microwaves. The fantastic **details are contained in the file marked "Operation Pandora," ...In the 60,U.S. security men discovered the strange microwave impulses, some steady, some pulsating, directed into our Moscow embassy from a neighboring building.** ...At the June 1967 Glassboro meeting between President Lyndon Johnson and Soviet Premier Aleksei Kosygin, the question of the microwave rays came up. One informant insists Johnson personally asked Kosygin to end the ray bombardment, although other sources say the request was made at a lower level....Footnote: We have spoken with Cesaro, Pollack, Sharp, Zaret and Grove. **All acknowledged they worked on "Operation Pandora," but all refuse to go into details. As Sharp put it: "Pandora," was classified in those days and still is."**

No author.(1976, Mar.22). The Microwave Furor. Time. Pg. 15.

"...Last month the U.S. confirmed that for some 15 years the Soviet Union has been beaming microwaves at the hulking nine-story U.S. embassy... ...why is Washington being so closetmouthed about the affair? "Maybe we're doing the same thing back in triple spades," suggested a former Moscow resident. Another theory is that Kissinger has soft-pedaled the issue for fear of further damaging detente. In any case, Time has learned that the State Department last week decided to launch a full-scale medical investigation of the thousands of U.S.

Gwertzman, Bernard.(1976,Jul.8). Soviet Dims Beam at U.S. Embassy **But Kissinger Aide Wanted the Microwave Radiation Eliminated Altogether.** New York Times.Pg.1.

"According to Mr. Funseth,[State Department spokesman] **the level of radiation aimed at the embassy was now less than two microwatts per square centimeter.** ...**American industrial safety standard, Mr. Funseth said, permit as much as 10,000 microwatts per square centimeter. The Soviet Union's**

stricter industrial standards permit only 10 microwatts. ...the continued beams caused a psychological problem.

UPI.(1978,Mar.28).Mystery Radio Signals May Cause Illness.Chico(Calif.) Enterprise-Record. Pg. 3C.

"Engineer and state health officials investigating reports of mysterious and disturbing radio signals rising across Oregon say they could be coming from anywhere-even outer space. The powerful shortwave radio pulses have been detected in Portland and Bend..."At the same time this electromagnetic sources has been detected, people have reported noises in the head, stuffiness and reddened skin. ...the Federal Communications Commission, the National Bureau of Standards, and the Environmental Protection Agency have been asked to help...The 4.75-megahertz frequency, far from the usual microwave-oven frequency, is in the range usually assigned to the federal government and for international overseas communications, he [Clifford Schrock, an electronic engineer Pacific Northwest Center for the Study of Non-Ionizing Radiation] said."

[Contents](#)

Chapter Nine

The development of mind control technology has been and is the goal of many governments and is a reality today. Here is a summary of the main points and their application to mind control experimentation. With all of the facts taken together, it can be concluded that the brain was decoded and the information was applied to intelligence tools and military technology in the 1940s to about 1965. Victims began reporting experimentation in the 1960s. The level of brain research matches this timetable. The discovery of the secret of life was linked to DNA in the 1950s and the genetic code was broken in the 1960s. As a result there is a massive gene mapping federal and worldwide program to apply the knowledge of DNA. Similarly, the teams and groups of the world class scientists, engineers, physicists, etc. were assembled in major universities, think tanks and government labs by the military to solve military problems in the 1940s, 50s and 60s. Research on the brain was well-funded and classified as a result of the arms race with Russia, beginning with the Korean brainwashing scare of the early 1950s.

Enough independence sources of information over the last 50 years corroborate the fact that the Soviet Union was interested in and were developing weapons with electromagnetic effects on biological organisms. The CIA's reaction to the Korean brainwashing scare is an example of what a fearful and important capability mind control weapons were to the U.S. government officials. Behavior experiments were conducted covertly for about 20 years.

Since the 1930s science has been working on the mysteries of mental processes and how the brain works as a system. A few famous researchers included Wilder Penfield and Dr. James Olds both of whom used implanted electrodes and locate the brain's different areas such as visual and auditory locations. Sir Charles Sherrington described the brain as "an enchanted loom..." Sir John Eccles worked at the neuronal level with the electron microscope in the 1950s, as did the noted W. Grey Walter. Eccles believes that a quantum physical effect mediates our spiritual souls and our physical brains. "Our conscious brains, he declares, are woven from subtle physical ingredients that somehow enable us to take advantage of the profound organization of our mathematically underpinned universe..."

Wiener and McCulloch were examples of scientists looking for the mathematical formulas and the quantum basis for brain mechanisms. McCulloch also worked on the phenomena of vision. Wiener stated that "highly specific microradiation is a property of brain waves". He further stated that "specific types of radiation associated with nucleic acid complexes randomly scattered within neurons, when applied to encephalography should bring productive results". **Brain and electromagnetic phenomena on a quantum level are repeatedly described by the leading researchers of the day.**

Several scientists described the mathematical formulas involved in wave theory and applying this to visual processes(McCulloch) and to memory(Pribram), for example. This is a necessary step to read brainwaves remotely. The visual system has been intensely studied by the military and the process was solved. Both Remond and Wiener spoke about the necessity of detecting and mathematically analyzing brainwaves in a language of simple waves. In the 1940s and 50s, Dr. McCulloch knew of Remonds outstanding work as did Dr. Lilly. Dr.Lilly stated that Remonds work could be used to stimulate the brain without electrodes and that it could be carried out on a person covertly at that time. In the 1960s Pribram, Lilly, Adey and the Institute for Defense Analysis attended Brain Research Institute Conferences with funding in part by the USAF.

Wiener stated that encephalography has been too much in recognizing wave patterns subjectively. "Too little has been done for determining what actually happens there...We have not done enough work making atlases of frequency distributions. ...This method is looking for specific numbers". Both Remond and Wiener applied wave theory and mathematics which computers could eventually do. This part of the research, mapping of brain signals would require a massive project involving many scientists. The National Institutes of Health funded Remonds work and along with many other facts demonstrates that he was on the right track. **Mapping the frequencies of the brain was another step closer to mind reading.**

The U.S. pioneers in mind control development are Dr. Jose Delgado and Dr. Ross Adey. There are several but they are representative. Dr. Delgado, extensively cited in mind control literature for stopping a charging bull with remote signal to implants in the bulls brain also demonstrated in animal experiments that electromagnetic signals without implants could accomplish the same effect. Dr. Adey is widely quoted for describing the key to actually communicating with the brain remotely. Dr. Adey is a leading electromagnetic researcher who has spoken before congressional hearings on related topics, stated the following. "It is now well established that intrinsic electromagnetic fields play a key role in a broad range of tissue functions, including ...information transmission in the nervous system. These same processes may be profoundly influenced by electromagnetic fields induced by an external force." **This is the fact that the U.S. government has suppressed since the 1940s, the nonthermal effects of electromagnetic radiation.**

Dr. Adey, Pribram, Hameroff and Dr. Moravec, among others, researched the brain and described electromagnetic wave properties of the brain functions **as a method of direct communication with the brain.** Dr. Possony, the Stanford Hoover Institute Fellow, Stated "Nothing is as yet know or is known publicly, on how the soliton can be aimed to produce desired effects ...will have a crucial bearing both on the body and on the brain and on defense." **All of the above are discussing communication with the brain on a quantum level using sub atomic physics and optical biophysics.** The development of SQUID, MRI and the developing HTSC are all based on similar principles. This can be related to the Tennenbaum articles on Soviet electromagnetic weapons. These are the main principles behind mind control technology. **The key to consciousness is a mathematical definition of the brain processes on a quantum level.**

The many articles on MRI and brain mapping described the interest and ability to measure and decipher signals of the brain and since classified research is usually estimated to be about 20 years ahead, it is reasonable to conclude that a person's brain can be read remotely. **Penrose and Hameroff described what they felt may be the site of consciousness, where classical physical activity interacts with quantum physics. The groups of neurons transmit images, thoughts and feelings. In the article by Hameroff, Pribram and others, the abstract stated,(pg. 32) "Laser-like long-range coherent quantum phenomena may occur biologically within cytoskeletal microtubules. ...may provide a basis for biomolecular cognition and a substrate for consciousness.** This article was published in 1993, agrees with Soviet research and all of the previously cited sources of information. **This is the Holy Grail of consciousness, the precise point.**

The Tennenbaum quotes are worth repeating for their clarity. The point to remember is that the mind control technology uses highly non-linear effects of electromagnetic radiation upon living organisms. And this can range from ELF to hundreds of gigahertz. **The key is that molecules themselves are nothing but electromagnetic configurations. That is, the molecules act via electromagnetic fields by exchange of electromagnetic energy with other molecules. Scientists have identified the precise geometrical characteristics of the electromagnetic action associated with the given substance, and then just mimic the molecular action by a carefully tailored signal. This is the basis of the mind control weapons. In this research, deep secrets having far-reaching military implications have been discovered and developed.**

But it was the Soviets who discovered the key to mind control technology first. The pioneers were V.I. Vernadsky, who's research program coined the military slogan "Who controls the entire electromagnetic spectrum will dominate the world". Alexander Gurvich followed Vernadsky in biophysical research and was the first to systematically demonstrate that absorption of minute amounts of "tuned" electromagnetic radiation, down to individual quanta, can decisively influence the course of biological events." This is called the "informational role of electromagnetic radiation in biological systems". This is the key and was further developed for military purposes. Litisitsyn, wrote a paper in the 1960s which stated that the Soviets broke the genetic code of the human mind". Much more research on this topic is needed but this is the foundation of this historic but classified discovery. The fact that Wiener and others have mentioned similar theories during the last 50 years is further support.

Michael Liebig discussed the soviet design of mind control technology, include principles of lasers, particle

beams, and non-linear electromagnetic pulse effects. Sub-atomic physics, modern high-energy physics, especially the use of "force free" status of plasmas, show that sub-atomic phase space has a distinct, Kepler-Gauss sort of inherent curvature. It involves the curvature of "force-free," least-action states in the sub-atomic domain. Modern optical biophysics or bioelectromagnetics and non-linear spectroscopy of living processes is combined with lessons of high-energy physics of force-free plasma states and is the key to these weapons. This was corroborated by the many article excerpts on solitons, HTSC, SQUID and MRI. The Soviet Union **had** the technological base to develop electromagnetic weapons, while the U.S. does to this day.

Tannenbaum also stated that direct coupling of highspeed computers to solid state radar was needed to optimally exploit non-linear biological effects. He mentioned HTSC as a major improvement. A sophisticated EP weapon must project a specific geometry of electromagnetic field onto a distant object, over a given terrain and in given surroundings. By choosing the right geometry, the signal can be focused into any desired area, such as the brain. He discussed one relevant techniques, phased array radar. The U.S. has advanced computers and the best radar systems in the world, for example the NSA(National Security Agency) equipment.

The answer to how a victim can be targeted and tracked can be explained with this technique, phased array radar technology. Tannenbaum described the phased-array antennae and the importance of holography, which would measure fields rather than one-dimensional electromagnetic signals. The antenna is capable of locking on to a target and can track objects using computers and inverse-scattering computations within a fraction of a second. There are satellites that can use GPS or global position system anywhere in the world and it too has been classified and developed for years. If a person gives off an identifiable electromagnetic signal, then an antenna can lock onto and track the target 24 hours a day anywhere in the world. A simplistic example would be an airport traffic controller's radar system to track numerous planes at once. Antennas today can pick up and track the individual target's signals. It is complicated and difficult to summarize but it definitely can be done.

[Contents](#)

Mind Control Technology Correlates with Victim Allegations

By breaking the problem down to manageable size, mind control technology used in mind control nonconsensual experimentation can be described. SQUID can read minute magnetic signals from the brain and with mathematic computations correlate this to processing of light stimuli by the brain, for example. In the development of MRI in the early 1970s, fourier transforms and pulse techniques were described as a way to decipher the very minute brain signals among all the electromagnetic background noise. And in 1980, Dr. Mackay described cross-correlation as one of the most powerful computational techniques for extracting significant information from brain signals. And now Tannenbaum and many articles describe the future use of HTSC for reading minute biological signals in the late 1980s. The theory behind detecting thought processes is passing the test of time.

MEG was used to pick up the magnetic signals which are oscillating millisecond fluxes of the brain in real time. If there were electromagnetic codes and programs for the brains processes that have already been discovered, (as in the gene mapping project), then the signals would have meaning.

Victims report that their thoughts can be read instantly and replied to, that pictures and dreams, memories and feelings can be remotely manipulated and controlled. Every nerve and muscle of the body can now be controlled. Again, breaking the problem down to manageable amounts is very helpful in describing the technology available that could account for victim's allegations. One previous example was the artificial retina chip, a copy of the neural organization of the retina and visual processing as the human brain does. This and the visual processing of the brain by frequencies mentioned previously could have been discovered and would account for dreams, pictures and implanted visualizations reported by victims.

The hearing of voices has been described elsewhere via microwave effects by the military to be used against terrorists (see CAHRA, Intelligence tools). The manipulation of memory could be accounted for with Wiener's theory of the storage via nucleic acid complexes. Others have made the hypothesis of a molecular code that may be searched out and finally mastered, according to discussions at the American Association for the Advancement of Science(Lessing,1967, DNA Pg. 56.). Long and short term memory may use different mechanisms and Pribram's theory of holography may be a key process. Pribram has suggested

that sensory information is relayed and reconstructed by neuron interaction and also the sensory cells can interact to form a type of hologram[which is made up of electromagnetic waves]. This information combined with previously described techniques demonstrate how in principle, this could be done without a chip or implant. From the many facts, it can be concluded that the functioning of the brain has been discovered and applied to military applications. The underlying principles have been discovered.

Manipulation of feelings could be done via electromagnetic signals. Penfield described the experiments in the 1930s of stimulating areas of the cortex while surgically treating epileptic patients and patients would describe reliving of a previous memory, a flash-back, smelling certain smells and feeling physical sensations. The process for targeting areas of the brain for rage, happiness, and many other feelings most likely have been located.

Manipulation of every nerve in the body can be explained via electromagnetic signals to specific locations of the brain. The process of sensations and movement may be catalogued in the atlas of signals which Wiener predicted. And the underlying brain mechanism for processing sensations have been determined. This does not seem so farfetched now that very weak signals can be detected and correlated to specific stimulus. The location of the electromagnetic source is possible with MEGs, magnetoencephalography, as stated in a previous article,(pg. 40) and therefore could be targeted by remote means. Recording the signals and then playing them back has been described as the means for direct communication with the brain. Any sensation could be created if a specifically tailored electromagnetic signal were known or mimicked and transmitted. The military interest in solving very complicated brain processes has created the funding needed for scientific projects such as this.

The robotic effects or street theatre that many victims describe is worth mentioning. Behavior of people can now be engineered as if they were puppets. Delgado's research with implants which stopped a charging bull and then with remote electromagnetic signals is one part of this puzzle. The military has done extensive research on hypnosis(see Operation Mind Control, Walter Bowart 1978). The electromagnetic signal or command is directed to the subconscious, and as in hypnosis the target will do whatever the command states. This has been demonstrated by J.F. Schapitz in government experiments(See The Controller, Martin Cannon). The brain is a complex system and there are no easy explanations. This was meant to be the beginning of a solid foundation of proof of government mind control technology that would overcome the lack of government documents that are classified under the National Security Act.

[Contents](#)

Conclusion

The capability to read and communicate remotely with the brain is a technology that governments would go to great lengths to develop, especially to surpass an enemy that is developing mind control technology also. Over 25 articles on Russian mind control are available (see also CAHRA UN Report) and a few of the many examples were presented here. The Soviets have had a documented history and interest in mind control weapons from the 1940s to the 1990s. The emerging technologies of quantum physics, brain biology and electromagnetic technology combined with cold war military funding and mind control technology was developed because of an arms race to control man.

The history of the Vietnam sensors technology and targeting of populations firmly established that the military has a bureaucracy for conducting classified research that would be similar for mind control technology. It is clear that remote surveillance is very sophisticated. DARPA and IDA, both active in sensors research, are two organizations to research further and would be likely conduits for mind control technology. Here is an absolutely classic summary of the science and government atmosphere in the early 60s in which mind control would proliferate. Charles Townes, who won the Nobel prize for invention of the laser in 1964 along with two Russian researchers, discussed DARPA in his book Making Waves, 1995. "The proposed position for me was Vice President and Director of Research for the Institute for Defense Analysis. The Institute was a non-profit "think-tank with a very important role, run by five or six prominent universities on the East Coast, Columbia University being one of them. It managed what was known as the Weapons Systems Evaluation Group. We had to pick the right people who would be responsible for analyzing how and whether a weapon worked and its effectiveness. We also advised a new organization, the Advanced Research Projects Agency, whose aim was to consider what could be done in space, and to help initiate new ideas and technologies of importance to national security. We also advised the State Department on arms control problems. ...I met with Allen Dulles, then head of the CIA... It was a lengthy presentation of all

the highly classified evidence we had. Finally he{Dullles} asked me, "What do you think?" (Townes, Pg. 199).

Tennenbaum felt that SDI, the Strategic Defense Initiative was a cover for electromagnetic weapons as the same technology is involved. He stated that in 1983, the beginning of SDI, Russian biophysics research went underground. This is when the strategic expert, Dr. Possony published his article on direct communication with the brain. So much more research is needed.

It is difficult to describe scientific technology while it is classified and has not officially been used. Several independent sources support claims of the existence of government mind control and many scientists worldwide have stated that mind control technology is possible. The bureaucracy is in place and the victims are alleging serious human rights abuse. This is a serious issue worthy of further investigation.

This is more than enough evidence to establish the need for an investigation. The burden of proof of obtaining the classified documents and/or tying the electromagnetic signals used on victims to the government or corporations involved, is too high and victims are suffering and dying. It is cruel to make alleged victims of mind control experimentation and use, meet this burden of proof in order to get help. The government has been and is developing a weapon used against the brain and mind. This fact alone deserves special attention. The claims made by victims may sound crazy, but not in light of the facts. Knowing past government motive and behavior, victims deserve a compensating government mechanism for an investigation into alleged abuses. Please share your thoughts, ideas, suggestions and conclusions with CAHRA.

Note: In general and for this paper, mind control, electromagnetic weapons, nonlethal weapons, psychotronic weapons, information weapons, neuroweapons, nonthermal bioeffects weapons are or include

weapons which target the human brain and body, usually with electromagnetic radiation or magnetic signals.

About the author, Cheryl Welsh

I am a law student at Lincoln Law School in Sacramento, California. I received an AA degree in math and science, a bachelors in physical education from UC Davis in 1991 and a second bachelors in government from California State University, Sacramento. I started a nonprofit IRS-approved research and education organization, Citizens Against Human Rights Abuse (CAHRA) in 1996, now renamed Mind Justice. In 2002, the United Nations Institute for Disarmament Research (UNIDIR) endorsed my paper on nonlethal weapons and cited CAHRA as a nonlethal weapons expert.

I have been interviewed by CNN on the program *American Edge* in 1997, the 1998 Learning Channel program, Ultrascience III entitled *Spies R Us*, which also featured a demonstration of microwave auditory effects by Dr. James C. Lin, electrical engineer and Sacramento's KOVR 13 TV News in 2001. The North Bay Progressive published my 2003 article on the total lack of human subject protections for national security experiments even after the 1990s radiation experiments scandal, posted at www.mindjustice.org.

I have many letters of recommendation from human rights experts and professors who support my research but given that mind control is an extremely controversial issue, they wish to remain anonymous. My hope is that this paper will be another step towards the acceptance of mind control as a legitimate and serious public concern.

The information in this paper is very under-reported but scientifically sound nonetheless and therefore my related curriculum vitae and the following two endorsements were included here to show the veracity of this information.

[Table of Contents](#)

Endorsement by Dr. Eldon Byrd, former director, Marine Corps Nonlethal Electromagnetic Weapons Project

Dr. Byrd endorsed the basic historical and scientific information about nonthermal bioeffects of electromagnetic radiation as presented in this paper. He worked with Dr. Adey, met Dr. Delgado, Dr. Becker and others who are pioneers in the field of bioelectromagnetism and I was privileged to work with Dr. Byrd the year before he died of pancreatic cancer.

Dr. Eldon A. Byrd wrote a letter of recommendation for CAHRA's [now Mind Justice] work, excerpt below. Dr. Byrd was quoted in the US News and World Report, July 7th 1997, *Wonder Weapons The Pentagon's quest for nonlethal arms is amazing. But is it smart?* by Douglas Pasternak. Here is the complete quote on page 45-46;

Low-frequency sleep

From 1980 to 1983, a man named Eldon Byrd ran the Marine Corps Nonlethal Electromagnetic Weapons Project. He conducted most of his research at the Armed Forces Radiobiology Research Institute in Bethesda, Md. "We were looking at electrical activity in the brain and how to influence it," he says. Byrd, a specialist in medical engineering and bioeffects, funded small research projects, including a paper on vortex weapons by Obolensky. He conducted experiments on animals-and even on himself-to see if brain waves would move into sync with waves impinging on them from the outside. (he found that they would, but the effect was short lived.)

By using very low frequency electromagnetic radiation-the waves way below radio frequencies on the electromagnetic spectrum-he found he could induce the brain to release behavior-regulating chemicals. "We could put animals into a stupor," he says, by hitting them with these frequencies. "we got chick brains-in vitro-to dump 80 percent of the natural opioids in their brains," Byrd says. He even ran a small project that used magnetic fields to cause certain brain cells in rats to release histamine. In humans, this would cause instant flulike symptoms and produce nausea. "These fields were extremely weak. They were undetectable," says Byrd. "The effects were nonlethal and reversible. You could disable a person temporarily," Byrd hypothesizes. "It [would have been] like a stun gun."

Byrd never tested any of his hardware in the field, and his program, scheduled for four years, apparently

was closed down after two, he says. "The work was really outstanding," he grumbles. "We would have had a weapon in one year." Byrd says he was told his work would be unclassified, "unless it works." Because it worked, he suspects that the program "went black." Other scientists tell similar tales of research on electromagnetic radiation turning top secret once successful results were achieved. There are clues that such work is continuing. In 1995, the annual meeting of four-star US Air Force generals-called -CORONA- reviewed more than 1,000 potential projects. One was called 'Put the Enemy to Sleep/Keep the Enemy/ From Sleeping. It called for exploring 'acoustics,' 'microwaves,' and 'brain-wave manipulation' to alter sleep patterns. It was one of only three projects approved for initial investigation.

January 8, 2002

To Whom It May Concern

This letter of recommendation has been prepared to introduce and support both a technology and a person. The person is Cheryl Welsh, a law student and researcher who is engaged in trying to find out what is behind the thousands of cases of reported abuse against humans that is causing pain and suffering to innocent victims. The technology is one which, if applied malevolently, could cause the abuse.

...

I am qualified to evaluate the technology involved, having been in charge of the US Marine Corps Electromagnetic Non-lethal Weapons Development Project in the early 1980's, wherein it was shown that it was possible to alter the behavior of animals with magnetic fields, and entrain human brain waves remotely. Since then, the technology has progressed to the point where even genetic engineering with fields is possible and demonstrable. That the technology to inflict mind control on human beings exists is beyond question. What Cheryl Welsh intends to examine is if it is being used, and if so, by whom? She should be listened to, not dismissed, and she should be supported, not demeaned. What she has uncovered and will uncover is important to the future of mankind, regardless of whether the technology is now being used, because it's potential for abuse is very real and of concern to us all.

Eldon A. Byrd

Endorsement by Dr. Rosalie Bertell, epidemiologist and human rights expert

The basic electromagnetic weapons history in this paper were endorsed by Dr. Rosalie Bertell in a previous paper I wrote containing the same basic information. The history of electromagnetic radiation weapons is a specialized, rarely publicized topic known to Dr. Bertell, who documented military microwave zapping of Greenham Commons women nuclear protesters in the 1980s as reported in London Guardian March 10, 1987.

Dr. Rosalie Bertell has a doctorate degree in Biometry, the design of epidemiological research and the mathematical analysis of bio-medical problems. She authored UN reports on the Chernobyl disaster, has five honorary doctorates, numerous peace prizes and more. In an email dated March 12, 2001, Dr. Bertell stated,

Date: Mon, 12 Mar 2001 18:27:42 -0500

Dear Cheryl, I have received your document and I think you have enough information for a documentary report or an article by an investigative reporter. It may raise concern about the issues, but does not prove anything. [Dr. Bertell is referring to the document, *EMR Weapons: As Powerful as the Atomic Bomb* at www.mindjustice.org]. ...There is some confusion about weapon use and harassment or experimental use, with the latter being harder to document. The health effects which can be attributed to EMR weapons is also, as you know, not established. Your problems are quite similar to that of the atomic bomb victims, including the military, the Japanese and those living downwind of a nuclear test site. Very few of the experienced health effects have ever been admitted. We also deal with the same denial and secrecy with the Gulf War, Bosnia and Kosovo vets exposed to ceramic DU...

[Table of Contents](#)

1. Introduction

Few people would connect the new growth of neuroscience research with nonlethal electromagnetic weapons programs. The nexus between neuroscience predictions that the brain will be decoded in the 21st century and human rights experts warnings that nonlethal electromagnetic weapons are more powerful than the atomic bomb, is not obvious. But with a few more facts, the significance of the connection becomes very obvious and relevant.

As John Horgan reported in the October, 2004 Discover article entitled Mind Control, scientists agree that the brain cannot be decoded with any sophistication, like the genetic code, with current technology. But major advances are in the works. Few people are aware of the post cold war expansion of programs for nonlethal electromagnetic weapons which target the brain and body. The nonthermal bioeffects of electromagnetic radiation are any effect other than heating, as in a microwave oven and are the basis of important brain functions. Nonthermal bioeffects would not be the single theory to decode the brain but new neuroscience and weapons programs are receiving significant funding for nonthermal effects research.

The history of the convergence of neuroscience and weapons development presented here is fascinating and reveals serious consequences beyond the atomic bomb. This quote by a Darpa (Defense Advanced Research Projects Agency) scientist illustrates the issue in everyday terms.

Washington AP, May 22, 1988 by Barton Reppert, entitled, *Looking at the Moscow Signal, the Zapping of an Embassy 35 years later, The Mystery Lingers*,

[Richard S.] Cesaro, [deputy director for advanced sensors at the Pentagon's Advanced Research Projects Agency] helped run the classified [1960s] Project Pandora, in which monkeys were exposed to a 'synthetic Moscow signal' in a laboratory at Walter Reed Army Institute of Research. ...Cesaro, in an interview prior to his death two years ago, contended that "in our experiments we did some remarkable things. And there was no question in my mind that you can get into the brain with microwaves."

Arguing that the Soviet bloc's investment of funds, personnel and laboratory facilities in research on non-ionizing radiation bioeffects has far outstripped the West's, he said, "I look at it as still a major, serious, unsettled threat to the security of the United States, ...If you really make the breakthrough, you've got something better than any bomb ever built, because when you finally come down the line you're talking about controlling people's minds,"

Information on classified mind control programs reveals that they did not stop, despite claims by the CIA. The January 29th, 1979, Washington Post article, *Book Disputes CIA Chief on Mind-Control Efforts; Work Went On Into 1970s, Author Says*, by Bill Richards reported,

Despite assurances last year from Central Intelligence Director Stansfield Turner that the CIA's mind-control program was phased out over a decade ago, the intelligence agency has come up with new documents indicating that the work went on into the 1970s, according to a new book. ... John Marks, the author of the book, said the CIA mind-control researchers did apparently drop their much publicized MK-ULTRA drug-testing program. But they replaced it, according to Marks, with another supersecret behavioral-control project under the agency's Office of Research and Development.

The ORD program used a cover organization set up in the 1960s outside Boston headed by Dr. Edwin Land, the founder of Polaroid, who acted as a "figurehead," said Marks in his book. The project investigated such research as genetic engineering, development of new strains of bacteria, and mind control.

A freedom of information act request for program details was denied.

The fifty year history of nonthermal bioeffects of electromagnetic radiation and it's growing significance for neuroscience and nonlethal weapons is a key factor for uncovering evidence of mind control weapons. Today, nonthermal bioeffects of electromagnetic radiation are the basis for very important neurological and biological processes, according to new government documents. The nonthermal bioeffects theory is the basis for very powerful mind control weapons, according to scientists.

It is important to note; the US government's official policy on the nonthermal bioeffects of electromagnetic

radiation during the cold war was; there is no proof of nonthermal bioeffects of electromagnetic radiation. After the breakup of the Soviet Union, the US government's official policy took an about-face and new post cold war neuroscience research programs and electromagnetic weapons programs based on the nonthermal bioeffects have begun. This paper will include;

Government reports on funding of 1)three new Apollo-like government neuroscience research projects, 2)cold war, very classified nonlethal electromagnetic weapons programs and 3)expansion of funding for electromagnetic weapons as described in three unrelated, major post cold war defense reports,

Evidence of suppression/secrecy classification of nonthermal bioeffects research,1) statements by two scientists whose pioneering research on nonthermal bioeffects of electromagnetic radiation have withstood the test of time and who spoke out in spite of the US government's official cold war policy denying that nonthermal bioeffects exist, and 2) the recent post cold war government funding of one of the scientist's research, years after losing cold war government funding for speaking out,

Evidence of current funding of classified 'mind control' electromagnetic technology; 1) Lockheed Martin scientist who demonstrated electromagnetic mind control technology and whose work is classified in part,

Government secrecy policies and control of information available to the public and control of research funding for neuroscience, electromagnetic radiation bioeffects and nonlethal weapons programs,

Legislation to ban russian mind control by the prominent Duma member V.N. Lopatin and post cold war military analyst's government reports on expanding electromagnetic and russian mind control programs,

New information presented here and rarely reported in mainstream media, clarifies conflicting information available on mind control and nonlethal electromagnetic weapons and documents the fact that classified weapons to target the brain and body began during the cold war and continue to expand, to the present time. The passage of time and new information has revealed how advanced the weapons probably are.

[Table of Contents](#)

2. Apollo-like new programs in neuroscience and the connection to national security

Neuroscience today is comparable to genetics research twenty years ago. According to many scientists, it is a matter of years or decades before scientists will understand how the brain works. Defense Advanced Research Projects scientist John Chapin was quoted in the October, 2004 *Discover Magazine* article entitled, *Mind Control*. "The neural code [is] right up there with two other great scientific mysteries: the origin of the universe and of life on earth. The neural code is arguably the most consequential of the three." But the article continues, "...the neural code may be the hardest to solve." The focus of this paper is on neuroscience research for national security purposes.

"During the 1940s and 50s, the bulk of psychological research was provided by national security agencies that were interested in gaining an advantage during the cold war", reported ethicist Jonathan D. Moreno in a February, 2003 Neuroscience article entitled, *Mind Wars*. Dr. Moreno is referring in part to research by the CIA, the infamous Mkultra program which included research on the human effects of LSD and the effects of electromagnetic radiation for control of animals and humans, as described in a well-documented 1978 book by law professor Allen Schefflin, *The Mind Manipulators*.

Beginning with the 21st century, there has been enormous government funding of big science projects to decode the brain and its mysteries and to find megatechnologies to manipulate the neurology of humans. Here are three examples.

First, the Department of Commerce, June, 2002, four-hundred page report entitled, *Converging Technologies For Improving Human Performance* (<http://www.wtec.org/ConvergingTechnologies/>) recommends a 'human cognome project'. A London Times April 29, 2003 article, Welcome to the Nanostate reported that the government calls this effort 'NBIC (Nano-Bio-Info-Cogno)', an Apollo-like program, and its director, Mihail Roco of the National Science Foundation has secured the US's biggest government commitment to technological research since the space programme, uniting the military, NASA, leading high-tech companies and the NSF(National Science Foundation) in a single vision with the goal of wiring together biotechnology. Jim Spohrer, chief technology officer at IBM described this program as "enabling a godlike level of control over knowledge, matter, mind and life."

Page 85-86, 2002 *Converging Technologies Report*;

...The convergence of nanotechnology, biotechnology, information technology, and cognitive science could create new scientific methodologies, engineering paradigms, and industrial products... By uniting these disciplines, science would become ready to succeed in a rapid program to understand the structure and functions of the human mind, The Human Cognome Project. Truly, the mind is the final frontier, and unraveling its mysteries will have tremendous practical benefits. ...

The Human Cognome Project It is time to launch a Human Cognome Project, comparable to the successful Human Genome Project, to chart the structure and functions of the human mind. No project would be more fundamental to progress throughout science and engineering, or would require a more complete unification of NBIC sciences. ...While the research would include a complete mapping of the connections in the human brain, it would be far more extensive than neuroscience. ...Some participants in the human cognition and communication working group were impressed by the long-term potential for uploading aspects of individual personality to computers and robots, thereby expanding the scope of human experience, action, and longevity.

Page 287 National Security, Theme Summary

Investment in convergent nanotechnology, biotechnology, information technology and cognitive science [NBIC] is expected to result in innovative technologies that revolutionize many domains of conflict and peacekeeping. ...As former Defense Secretary William J. Perry has noted, these are the technological breakthroughs that are "changing the face of war and how we prepare for war." There are numerous special programs, reports and presentations that address these goals. The Department of Defense has designated nanoscience as a strategic research area in order to accelerate the expected benefits (Murday 1999). ...

Applications of brain-machine interface. The convergence of all four NBIC fields will give warfighters the ability to control complex entities by sending control actions prior to thoughts (cognition) being fully formed. The intent is to take brain signals (nanotechnology for augmented sensitivity and nonintrusive signal detection) and use them in a control strategy (information technology), and then impart back into the brain the sensations of feedback signals (biotechnology).

The second major government neuroscience project is the 2002, two year, \$24 million, DARPA (Defense Advanced Research Projects Agency), government initiative which is actively funding neural research "to explore brain-computer interfacing and to create devices that allow one person's brain to communicate wirelessly with another's." In a Technology Review, May, 2003 article entitled, *Mind-machine Merger*, scientists discuss the need for a noninvasive brain signal detection technology, admit their work is speculative but "no longer view them [communicating wirelessly with another and upgrading thoughts, using thoughts to power machines...etc.] as pure fantasy."

The third major government neuroscience project is the \$700 million *Nanotechnology Initiative*, a 2000 government-run program, which includes the proposal and funding of research for methods of noninvasive neural probes and monitors, and direct brain to computer communication. Ten federal agencies fund the initiative including National Institute of Health and the Defense Department. *Government Executive* February, 2003 article on the Initiative stated;

"Bill Joy, co-founder of Sun Microsystems wrote in the April 2000 Wired Magazine that "Unfortunately, as with nuclear technology, it is far easier to create destructive uses for nanotechnology than constructive ones. Nanotechnology has clear military and terrorist uses." But Richard Russell, Associate Director for Technology at the White House Office of Science and Technology Policy, stated, "the kind of research that we're talking about is in areas that are directly helpful to both our economy and things like human health. ...It's research that's going to be beneficial to the human race."

Government reports are generally not designed with the public in mind. The three new government neuroscience projects are far reaching and the many news articles on the new neuroscience military research describe very futuristic high hopes with few details. Most of the information lacks even a minimum of scientific evidence and detail. The direction of research, some of which is classified, is influenced by military funding. The reports are limited to generalized ethical concerns. The reports present the public with

a biased view and a lack of solid information in which to evaluate the government claims.

[Table of Contents](#)

3. The link between the explosion of government neuroscience research and classified cold war/ post cold war weapons programs

The new neuroethics conferences have not included military research in their discussions and yet many articles describe weapons which target the nervous system and brain. This summary of 2004 developments, includes the long-term military interest in nonlethal, electromagnetic weapons and human rights expert's comments on the continuing problem of excessive secrecy. The excessive secrecy prevents evaluation of the new weapons by human rights groups. The Reuters World Service, May 30, 1996, *Microwave and acoustic weapons pose new threats*, Jim Della-Giacoma reported;

"...There are indications that [electromagnetic weapons] may have adverse affects on the brain," she [Louise Doswald-Beck, Deputy Head of the legal division of the Geneva-based ICRC(International Committee for the Red Cross)] ...Doswald-Beck said all developed countries were doing research on microwave and acoustic weapons. "The U.S. makes a lot of mention of it in its specialised literature but then they say it's classified. The same goes with some European countries. The West assumes that Russia's doing it, but it is kept under wraps," she said. Doswald-Beck said the ICRC was unable to do the early research on banning microwave and acoustic weapons because they were shrouded in secrecy.

The comparable cold war russian electromagnetic weapons programs indicates the importance of the weapons and a cold war competition with the US. Evidence of weapons programs in US and Russia can be found in UN documents. Certainly the conclusion can be made that if one super power were developing new weapons, the other would have to follow suit. US officials knew of possible electromagnetic weapons in 1977 and the official response was reported in the New York Times, August 12, 1977, page 7,

US rejects Soviet proposals at Geneva Disarmament Conference for comprehensive international treaty banning new weapons of mass destruction. US representative Adrian Fisher says US believes best approach is to work out separate agreements outlawing specific weapons, once they become public knowledge. Soviet delegate Viktor I. Likhachev says that 'important component' of revised version is list of types of armaments to be prohibited. Proposed list covers non-explosive radioactive weapons, infrasonic and electromagnetic radiation weapons.

First, an overview of electromagnetic nonlethal weapons from *Bulletin of Atomic Scientist*, September, 1994 article entitled, *Softkill Fallacy* by Steve Aftergood. Barbara Hatch Rosenberg writes;

Many of the non-lethal weapons under consideration utilize infrasound or electromagnetic energy (including lasers, microwave or radio-frequency radiation, or visible light pulsed at brain-wave frequency) for their effects. These weapons are said to cause temporary or permanent blinding, interference with mental processes, modification of behavior and emotional response, seizures, severe pain, dizziness, nausea and diarrhea, or disruption of internal organ functions in various other ways.

Bradford Non-Lethal Weapons Research Project(BNLWRP) Research Report No. 5 by Neil Davison and Nick Lewer, May, 2004 reported the following new information and issues concerning weapons which target the brain. Report posted at; http://www.bradford.ac.uk/acad/nlw/research_reports/

Page 36;

Robin M. Coupland FRCS, Medical Adviser, Legal Division, International Committee of the Red Cross, ...But what about an eye-attack laser, or a foam which sticks the people to the ground and to each other or, as is apparently being researched, the means to alter brain function with electromagnetic waves. The precise effects of such weapons - when used for real - in terms of mortality and residual disability or civilian deaths and injuries are not known with any certainty. But in contrast to weapons which injure by missile or explosive force, few medical people would recognize, let alone be able to treat such unusual effects.

Page 15 of the 2004 Bradford report;

Strategic Use of NLWs; Defense Science Board

The Defense Science Board, an advisory committee to the DOD [Department of Defense], published a report in February, 2004 entitled '*Defense Science Board Task Force on Future Strategic Strike Forces*'. One of their conclusions advocated non-lethal weapons for strategic use;

Non-lethal effects directed at the physiological or psychological functions of specific individuals or the populace. Applications of biological, chemical, or electromagnetic radiation effects on humans should be pursued. R&D into sophisticated psychological operations designed to change the minds of individuals or the populace is needed. Techniques could include projection of sounds and images to specific points in space. The Joint Non-lethal Weapons Program Directorate should broaden its tactical and operational focus to consider the strategic applications and associated treaty issues of non-lethal weapons.⁷³

⁷³ Defense Science Board (2004) *Defense Science Board Task Force on Future Strategic Strike Forces*. Office of the Under Secretary of Defense For Acquisition, Technology, and Logistics: Washington DC

The Defense Science Board excerpt describes recommendations for future research and are based in part on nonthermal effects of electromagnetic radiation. This illustrates the change in US cold war policy of denial of nonthermal effects. The weapons are for military, rather than intelligence mind control weapons like the CIA's Mkultra program and include psychological weapons for targeting individuals and the populace. Few people are aware that a significant amount of neuroscience research is conducted by the military.

[Table of Contents](#)

4. Cold war classified, large weapons programs include mind control

The 1999 Council on Foreign Relations, (CFR) report entitled, *Non-Lethal Technologies: Progress and Prospects* illustrates the already developed and very large classified programs which include neuroscience and nonlethal weapons. The subsequent 2004 Council on Foreign Relations report is also included below to demonstrate the ongoing interservice conflicts and lack of accountability. The 1999 report is available on the CFR website at <http://www.cfr.org/> Thanks to Harlan Girard of International Offensive Against Microwave Weapons for this information. First, the 1999 CFR report excerpt;

Once developed, these weapons [NLW or nonlethal weapons] must be deployed coherently, in synergistic coordination with information/psychological warfare technologies and conventional weaponry. Finally, various NLW programs dispersed throughout the individual services should be coordinated by the existing Joint Nonlethal Weapons Directorate (JNLWD). ...

And until January 1999, the directorate essentially had no access to joint programs in information warfare or psychological warfare. Nor did its brief extend to Air Force and Navy programs in nonlethal weapons. To reduce barriers between the Joint Nonlethal Weapons Directorate and what are said to be 'large programs' in psychological warfare, information warfare, and nonlethal weapons with strategic potential, a so-called insight program was established. As a result, a few individuals in the directorate now have an overview of these programs. ...

Recommendations ...5. Department of Defense policy for nonlethal weapons is inadequate in practice. The substantial barriers that exist between the Joint Nonlethal Weapons Directorate, with its focus on research and development for tactical applications, and the apparently larger Air Force and Navy classified programs constitute an impediment to the desired single, optimum nonlethal weapons program that is required to exploit the full potential of these weapons and that is mandated by Congress. ...

In a Memorandum of Agreement (MOA) adopted June 23, 1999, the services agreed to "coordinate and integrate the development of all nonlethal weapon programs and activities through the DOD nonlethal weapons Executive Agent." While this seems to be progress, the new MOA codifies restrictions-e.g., "insight, not financial oversight"-and limits access-e.g., "monitor status of service-unique programs through annual status briefings from the responsible service.

The 2004 Council of Foreign Relations report, *Nonlethal Weapons and Capabilities* is posted here; <http://www.cfr.org/>

Page 19 of the 2004 Report of an Independent Task Force Sponsored by the Council on Foreign Relations, entitled *Nonlethal Weapons and Capabilities* recommended that skilled engineers and scientists work on directed energy, electromagnetic coupling, modeling and physiology. Page 21 described the lack of access to classified programs such as cyber warfare, electronic and communications warfare, although the legislative mandate required access. Page 25 discussed already existing and much larger classified programs in the individual services that were not accessible to current nonlethal weapons development programs. Page 36 described the recommendation that more access to classified programs be made available so that coordination can take place and redundancy can be avoided.

How advanced the weapons are, cannot be determined from government reports. Most articles and government reports describe nonlethal electromagnetic weapons as heavily classified and little more. The military has not publicly used these weapons and there is no official reason given for the long-term heavy classification. One possible explanation, as many experts have stated; electromagnetic weapons and mind control weapons as powerful as the atomic bomb in their effects. For example;

1986 Press Conference on Gorbachev's Nuclear Arms Elimination Proposals. BBC "Weapons based on new physical principles would include, ... beam, radio-wave, infrasonic, geophysical and genetic weapons. In their strike characteristics these types of weapons might be no less dangerous than mass strike weapons. The Soviet Union considers it necessary to establish a ban on the development of arms of this kind."

Although not well-known, clearly, nonlethal weapons directly involve neuroscience research. For example from Scotland on Sunday, August 3, 1997, *It's war, Jim, but not as we know it*, by Jimmie Dettmer;

The Pentagon's exotic weapons programme, led by the Air Force, is cloaked in ultra-secrecy which forbids any public comment by scientists. ...The US Marine Corps has done research at its lab in Maryland on electromagnetic weapons,... "We were looking at electrical activity in the brain and how to influence it," scientist Eldon Byrd said recently. Electromagnetic radiation- basically waves below radio frequencies- was found to prompt human or animal brains to release chemicals that affect behaviour.

The military interest in nonlethal electromagnetic weapons continues to grow. Aerospace Daily February 27, 2004, *Task force calls for major push in nonlethal weapons* by Jefferson Morris reported;

An independent task force sponsored by the Council on Foreign Relations is recommending that the Department of Defense greatly increase funding for nonlethal weapons (NLW) and promote their use by the armed services. "We're serious about this," task force co-chair and former Marine Corps Commandant Gen. Paul Kelley (ret.) said at a press conference in Washington Feb. 26. "This probably is one of the most important additions ... to the military capabilities that I have seen in well over several decades."

The Navy Times, February 16, 2004, *Nonlethal weapons gain favor*, by Christian Lowe reported the Joint Nonlethal Weapons Directorate budget had nearly doubled in fiscal 2004, to \$44 million, for development and testing of nonlethal weapons. The Defense AT & L July 1, 2004 reported; The Defense Department's Director of Force Transformation, retired Vice Adm. Arthur K. Cebrowski, said, "...the United States must accelerate and expand its work in nonlethal weapons, directed and redirected energy, and biomedical response."

[Table of Contents](#)

5. Dr. Robert O. Becker, pioneer bioelectromagnetics researcher

As reported in the London Guardian Newspaper, February 2, 1991, *War in the desert* by Simon North, Dr. Robert O. Becker has twice been nominated for a Nobel prize for his work in bio-electromagnetism and had been the recipient of a prestigious US award for his medical research. Dr. Becker's cold war era research on the nonthermal bioeffects of electromagnetic radiation has withstood the test of time. While the military denied nonthermal bioeffects of electromagnetic radiation during the cold war, Dr. Robert O. Becker disagreed and described his 1970s loss of government funding for nonthermal electromagnetic bioeffect research in his 1990 book entitled, *Crosscurrents, Perils of Electropollution*. Now weapons and

neuroscience research government reports are building on and reporting funding of research very similar to his thirty year old nonthermal bioeffects research.

[Table of Contents](#)

6. New neuroscience research includes nonthermal bioeffects

The 2002 *Converging Technologies for Improving Human Performance*, has elaborated on Dr. Becker's research as described in his 1985 book, *The Body Electric; Electromagnetism and the Foundation of Life*. One example of Dr. Becker's research, page 238 of *Body Electric*;

We also found that we could work backward, using the [brain] currents to produce anesthesia. A strong enough magnetic field oriented at right angles to a current magnetically 'clamped' it, stopping the flow. By placing frogs and salamanders between poles of an electromagnet so that the back to front current in their heads was perpendicular to the magnetic lines of force, we could anesthetize the animals just as well as we could with chemicals, and EEG recordings of magnetic and chemical anesthesia were identical. We got the same effect by passing a current through the brain from front to back, canceling out the normal current of waking consciousness, as in electrosleep.

The 2002 *Converging Technologies Report* is now proposing similar research thirty years later. Page 355-6 of the report;

Non-drug Treatments for Enhancement of Human Performance, Robert Asher, Sandia Laboratories

Drug companies spend an average of \$800 million to develop new drugs that may have negative side effects. An alternative is to develop non-drug approaches to human performance enhancement. ...Consider the use of externally applied, non-dangerous electromagnetic fields ...that enhance human performance.

...What other changes can be engineered by a specifically shaped electromagnetic pulse that might enhance human performance without pharmaceuticals? ...This investigation may spawn a new industry in which the human is enhanced by externally applied electromagnetic pulses so shaped as to enhance specific biochemical changes within the body without drugs...

Fund work towards the goal of understanding in detail the effects of electromagnetics on cellular systems and on cognition.

Consider cellular electrochemical and structural changes and actions imposed by electromagnetics.

Fund work towards electromagnetic and biochemical dynamical modeling of cellular systems in order to both understand electromagnetic and biochemical aspects, as well as to optimize the shape of electromagnetic pulses to impose desired cell changes without inducing side effects.

Nonthermal bioeffects research was rarely openly discussed by the US government during the cold war. Not so, thirty years later; now government funding of research similar to Dr. Becker's animal experiments and recommendations for further exploration of nonthermal bioeffects are plainly evident. The actual funding of electromagnetic technologies for keeping soldiers and pilots awake and alert for up to five days at a time by 'zapping' their brain with electromagnetic energy was reported by The Telegraph, January 6, 2003, *Scientists seek 'super-soldiers' formula*. The article quoted Jan Walker, spokesman for Darpa, (Defense Advanced Research Projects Agency), who confirmed funding of this research at Columbia University, New York, Neurological Science Department.

[Table of Contents](#)

7. Weapons research based on nonthermal bioeffects

The US government has long funded classified research in the basic theory of nonthermal bioeffects of electromagnetic radiation. The 1990 description of weapons, below, is similar to the description in the 2002

Converging Technologies report above and also very similar to Dr. Becker's basic research on animals in the 1960s and 1970s. The 1992 International Review of the Red Cross, November 1, 1990, *Development of New Antipersonnel Weapons* by Doswald-Beck and Caderay described directed energy weapons as follows;

Research work in this field has been carried out in almost all industrialized countries,... In spite of the rarity of publications on this subject, and the fact that it is usually strictly classified information, research undertaken in this field seems to have demonstrated that very small amounts of electromagnetic radiation could appreciably alter the functions of living cells.

Research work has also revealed that pathological effects close to those induced by highly toxic substances could be produced by electromagnetic radiation even at very low power, especially those using a pulse shape containing a large number of different frequencies.

...Some research seems to have confirmed that low-level electromagnetic fields, modulated to be similar to normal brainwaves, could seriously affect brain function. Experiments with pulsed magnetic fields carried out in animals have reportedly produced specific effects such as inducing sleep and triggering anxiety or aggressiveness, depending on the modulation of the frequency used.

...It is, on the other hand, well known that lethal effects can also be produced using higher power levels than those used for the experiments on behaviour modification. An anti-personnel weapons based on such biophysical principles could produce similar effects to those of a nerve gas, but would have no secondary effects and leave no lasting trace.

This illustrates how the government can control neuroscience research by funding and classifying the research. The US government has a long-term interest in electromagnetic radiation bioeffects, the research is very classified and no weapons have been publicly used; all indicators of a powerful technology and national security issue.

The long-term military interest in the psychological effects of electromagnetic radiation is also relevant, as reported in the television documentary, *Opening Pandora's Box*, 1984, produced by David Jones for Fulcrum Central Productions, which aired on BBC Channel 4. On the BBC program, Dr. Becker stated that he was asked by the CIA in early 60s to determine whether pilots shot down and captured by Soviets in the 1960s could possibly have been exposed to electromagnetic radiation without them realizing it and would that have caused personality change. The pilots were tested psychologically before and when they came home.

A dramatic change in test results was found. The question posed by the CIA was; Can you change, entrain brainwaves with an external source? "Pilots did not report bad treatment and were not aware of any emr exposure by Soviets during debriefing sessions." They were interned by the Soviets for two to six weeks and returned with "considerable personality alterations".

The CIA wanted to know if there was a relationship between the Moscow Embassy and flight crews that would cause personality alteration? Dr. Becker stated "yes, there is a distinct possibility, we don't know at this time for sure."

[Table of Contents](#)

8. The nonthermal bioeffects controversy

The basic controversy over nonthermal effects of electromagnetic radiation was firmly established by the military's heavy dependence on electromagnetic technologies for radars, electronic systems, antennas, etc. If nonthermal bioeffects were found to affect the health of military personnel, lawsuits and costly preventive measures would be required, therefore the standard for exposure to electromagnetic radiation was set above the nonthermal bioeffects level.

The 1984 BBC TV documentary, *Opening Pandora's Box*, explained;

The safety standards for electromagnetic radiation, emr, were set higher in the 1950s to allow the military to have unlimited use of emr technology. At the time, American science reports suggesting emr health effects of brain tumors, heart conditions, leukemia, cataracts and more, were ignored. The military was a major source of funding and reports were not followed up. The government safety levels for emr were challenged in courts all around the world.

Microwave News, a journal on nonionizing radiation, for example, reported that radar men opposed microwave tower emr health dangers. Air traffic controllers and police officers filed complaints. These court cases revolved around the validity of the safety standard. Dr. Milton Zaret, another Pandora scientist explained that most government committees who set the safety standards around the world were set up the in the same way as in the U.S. Members of the committee did not want to impede or put restraints on progress by tightening the safety standards for emr.

Dr. Becker explained the how the government suppressed nonthermal bioeffects research in his 1990 book, *Crosscurrents, The Perils of Electropollution*.

The chapter entitled, The Hidden Hand on the Switch: Military Uses of the Electromagnetic Spectrum, page 297;

The military organism was designed on the 10 mW standard and, once in place, it had to be defended against the possibility of nonthermal bioeffects. The recognition and validation of these effects would mean the collapse of the total organism and the death of C3I, (for command, control, communications, and intelligence). ...evidence for nonthermal effects was viewed as a threat to national security.

Control over the scientific establishment was maintained by allocating research funds in such a way as to ensure that only 'approved' projects -- that is projects that would not challenge the thermal-effect standard -- would be undertaken. ...In some instances, scientists were told that nonthermal effects did occur, but that national security objectives required that they be exceptionally well established before they became public knowledge.

All of these reports shared certain characteristics. Scientific data indicating nonthermal bioeffects were either ignored or subjected to extensive and destructive review. ...while a statement such as 'There is no evidence for any effects of pulsed magnetic fields on humans' would have been literally true, it would have ignored the many reports of such effects on laboratory animals and the fact that no actual tests had been conducted on humans.

Scientists who persisted in publicly raising the issue of harmful effects from any portion of the electromagnetic spectrum were discredited, and their research grants were taken away.

Deployment of powerful and exotic electromagnetic systems continues, with little, if any, consideration given to the potential impact of these systems on the health and safety of the public.

[Table of Contents](#)

9. Denial of nonthermal bioeffects is a cover story for US weapons program

On the 1984 BBC documentary, Dr. Becker stated; "the best cover story [for a large, classified electromagnetic weapons program] is that, based on best American scientist's [opinions], the [US] nation has discarded [the theory of athermal] health effects from emr [electromagnetic radiation], entirely." In fact, this was the official US position. Post cold war articles prove that Dr. Becker was right. One of the many articles discussing post cold war funding of electromagnetic weapons includes the July, 7, 1997 US News and World Report, *Wonder Weapons*, by Douglas Pasternak; "For hundreds of years, sci-fi writers have imagined weapons that might use energy waves or pulses to know out, knock down, or otherwise disable enemies-without necessarily killing them. And for a good 40 years the U.S. military has quietly been pursuing weapons of this sort. Much of this work is still secret, and it has yet to produce a usable 'nonlethal' weapon. ...Scores of new contracts have been let, and scientists, aided by government research on the 'bioeffects' of beamed energy, are searching the electromagnetic and sonic spectrums for wavelengths that can affect human behavior."

[Table of Contents](#)

10. Dr. Ross Adey, bioelectromagnetics researcher dies

Dr. Adey was an outspoken advocate, for example, at a 1987 congressional hearing about the lack of

research on nonthermal bioeffects. Dr. Adey put the blame on military and corporate interests. As reported in Microwave News, May, 2004, http://www.microwavenews.com/may_04.html#may20;

Ross Adey died on May 20th at the age of 82 after a long battle against a series of bronchial infections. Adey, a medical doctor, was a towering figure in the EMF community, who was equally at ease talking about the most recent papers in the biological and medical literature or dissecting the arcane engineering details of an experimental setup. He is perhaps best known for discovering, with Suzanne Baldwin, the first non-thermal effect of electromagnetic radiation during the 1970s: They showed how ELF-modulated RF signals can lead to the release of calcium ions from cells.

While at the Brain Research Institute at the University of California, Los Angeles, he worked with the Department of Defense on Project Pandora, the super-secret program that sought a way to use electromagnetic radiation for mind control.

In the late 1970s, Adey set up a new lab at the VA Hospital in Loma Linda, CA, where he carried out studies on the role of power frequency EMFs in the promotion of cancer and later, on the potential cancer risks following exposure to cell phone radiation. As the chair of a committee of the National Council on Radiation Protection and Measurements (NCRP) investigating ELF health effects, Adey made waves by recommending strong action to curb public exposures. He endorsed a 2 mG exposure standard for 50/60 Hz EMFs (see MWN, J/A95). This was too radical for the NCRP leadership and today, close to ten years later, the council continues to refuse to release his report.

Adey prompted another stir when his studies of long-term exposure to cell phone radiation pointed to what appeared to be a protective effect -that is, exposed mice developed fewer tumors (see MWN, M/J96, J/A96 and S/O99). Motorola, which paid for Adey's experiments, repudiated this finding and soon afterwards stopped supporting his lab. It closed down a short time later. In an interview with Fortune magazine in October 2000, Adey urged that research continue: "There is a big task ahead to define what the lowest level of safe exposure could be," he said, predicting that, "Wherever we go we will be immersed in a sea of low-level pulsed microwave signals." A memorial service will be held in a few weeks in the Los Angeles area.

[Table of Contents](#)

11. Project Pandora findings; denial of nonthermal bioeffects

As mentioned in the Microwave News article, Dr. Adey conducted research on Project Pandora. The 1984 BBC TV documentary, *Opening Pandora's Box* explained the history of this 1960s US project.

The Soviets started bombarding the American Embassy in Moscow with a directional microwave beam with a mix of frequencies ranging from 2.5-4.1 GHz (gigahertz) in 1953 and the US government funded Project Pandora to find out why. Project Pandora was "a top secret multimillion dollar program". Top scientific experts were consulted by the American Government "about the meaning of microwaving" of the Moscow Embassy. "Five presidents kept it secret". President Johnson complained to the Soviet Premier Kosygin who claimed that he was unaware of the signal and would be sure that it was turned off.

Officially the Soviets did not admit that they were microwaving the Embassy. But the bombardment of the Moscow Embassy continued. It began in 1953 and in 1975 the signals changed with lower power signals.

A May 22, 1988 AP article entitled, *The Zapping of an Embassy: 35 Years Later, The Mystery Lingers* by Barton Reppert reported; "In 1976 Secretary of State Henry A. Kissinger tells a news conference that "this issue is a matter of great delicacy which has many ramifications." He declines to go into detail. ...In 1988, microwave signals in the 5-11 GHz range continue to be detected at the Moscow embassy... the State department reported."

David Jones, producer of 1984 BBC documentary, *Opening Pandora's Box*, asked Dr. Koslov, director of Project Pandora; "In terms of science there seems to be two possibilities, one is that behavior and health are affected by emr and the second is the creation of a new genre of weapons and that its conceivable that it is a totally black area of research. Dr. Koslov replied that back in 1965, there was alot of conjecture and

hypothesis about that. That's why it led to Project Pandora. Since then, I don't think there is very much possibility, that there is, at this point in time, there doesn't seem to be.

Dr. Sam Koslov,... continued, "[We] thought about it, don't get me wrong,... but nothing was found, it doesn't look like [there is]...militarily at this time, there is no emr weapons potential. There is nothing to the biological effects claim. There is an amount of power problem."

David Jones asked Dr. Koslov why he thought that the Soviets were microwaving the Embassy. Dr. Koslov replied that "I would rather not discuss it [because] it would get into security areas."

[Table of Contents](#)

12. Dr. Adey asks, "How stupid does the US Air Force think the public is?"

Dr. Adey wrote a 2002 letter lambasting the post cold war about-face, US Air Force policy on nonthermal bioeffects of electromagnetic radiation and the hypocrisy of the USAF Research Lab's, hosting of the *Third International Symposium on Nonthermal Medical/Biological Treatments Using Electromagnetic Fields and Ionized Gases*. Dr. Adey asked the question, "How stupid does the USAF think the public is?" A copy of the letter with documented details of the USAF's entrenched and long standing nonthermal bioeffects policy is posted at: http://www.emrnetwork.org/position/adey_jostes_nas_panel.pdf. Dr. Adey's research and advocacy will be greatly missed.

The 2004 book, *Bioelectromagnetic Medicine* edited by Dr. Paul J. Rosch and Dr. Marko S. Markov can be found in the UC Davis Medical library. Dr. Rosch wrote the following excerpt on the few trailblazers in the field of bioelectromagnetic medicine, including Dr. Adey and Dr. Becker.

In the decade to come, it is safe to predict, bioelectromagnetics will assume a therapeutic importance equal to, or greater than, that of pharmacology and surgery today. With proper interdisciplinary effort, significant inroads can be made in controlling the ravages of cancer, some forms of heart disease, arthritis, hormonal disorders, and neurological scourges such as Alzheimer's disease, spinal cord injury, and multiple sclerosis. This prediction is not pie-in-the-sky. Pilot studies and biological mechanisms already described in primordial terms, form a rational basis for such a statement- J. Andrew L. Bassett, 1992

Andy Bassett was one of the early advocates of the use of electromagnetic fields for uniting fractures that refused to heal. Unfortunately, he died before he could see that his prophecy would come true well ahead of schedule. In many respects this book is a tribute to him and other pioneers such as Bob Becker, Abe Liboff, Bjorn Nordenstrom, and Ross Adey who recognized the vast potential of bioelectromagnetic medicine and have helped to put it on a solid scientific footing.

[Table of Contents](#)

13. John Norseen's national security mind control research

Most people are unaware of the extent of government control in national security matters of, 1) research funding and 2) available public information. This is true for mind control research. In 2001, John Norseen, a Lockheed Martin neuroscientist, demonstrated promising mind control research, according to US News, which was subsequently described as promising future defense research in a 2002 major government report and after 2002 just disappeared. Norseen's research is a rare glimpse into government neuroscience/mind control research and the process of government funding and secrecy.

Research on human mind control for national security is seldom addressed by neuroscientists and unclassified scientific literature on military mind control is scarce. Most neuroscientists describe mind control as futuristic. The following articles report that Norseen's research is funded by the Pentagon, is classified in part, has actually been demonstrated and is recommended for future research by major government defense agencies.

US News & World Report January 3-10, 2000, *John Norseen Reading your mind-and injecting smart thoughts*, Douglas Pasternak described Norseen's work; "The key is finding 'brain prints'." "Think of your hand touching a mirror," explains Norseen. "It leaves a fingerprint." BioFusion would reveal the fingerprints

of the brain by using mathematical models. "Just like you can find one person in a million through fingerprints," he says, "you can find one thought in a million."

Signal Magazine, *Decoding Minds*, October, 2001 by Dr. John D. Norseen of Lockheed Martin reported; "We are at the point where this database has been developed enough that we can use a single electrode or something like an airport security system where there is a dome above our head to get enough information that we can know the number you're thinking,"

[Table of Contents](#)

14. Dr. Norseen's demonstration of mind reading.

In the New York Times December 9, 2001, *The Year in Ideas: A TO Z; The Lie Detector That Scans Your Brain*, Clive Thompson reported; "John Norseen, a scientist with Lockheed Martin, is often able to discern when subjects are thinking of particular numbers. He predicts that by 2005, brain mappers will be able to automatically scan the skulls of everyone going through airports to search for potential hijackers. ...But after the Sept. 11 attacks, the FBI and CIA are taking a closer look at brain mapping. And the Department of Defense is helping finance Norseen's research."

The Washington Times, August 17, 2002, *NASA plans to read terrorist's minds at airport* by Frank J. Murray;

Airport security screeners may soon try to read the minds of travelers to identify terrorists. Officials of the National Aeronautics and Space Administration have told Northwest Airlines security specialists that the agency is developing brain-monitoring devices in cooperation with a commercial firm, which it did not identify. Space technology would be adapted to receive and analyze brain-wave and heartbeat patterns, then feed that data into computerized programs 'to detect passengers who potentially might pose a threat,' according to briefing documents obtained by The Washington Times.

NASA wants to use 'noninvasive neuro-electric sensors,' imbedded in gates, to collect tiny electric signals that all brains and hearts transmit. Computers would apply statistical algorithms to correlate physiologic patterns with computerized data on travel routines, criminal background and credit information from 'hundreds to thousands of data sources,' NASA documents say.

The 2002 NSF *Converging Technologies* report included a description matching Norseen's research. Dr. Robert Asher of federal government Sandia Laboratories endorsed funding of nonthermal effects research and the last lines of the description below sounds very similar to Dr. Norseen's research. Page 356-8;

Develop a program that will explore the use of electromagnetics for enhancement of human performance. This program will be multidisciplinary in orientation, utilizing, ...

information technology in that the pulses need to be so shaped as to cause desired interconnected cell electromagnetic responses of cognition by external fields. ...

Nano. The brain-machine effort will require nanotechnologies in order to make the required experimental measurements and to implement the devices for both receiving brain electromagnetic signals and transmitting signals back into the brain. ...

Bio. This is a highly biological, neuroscience effort, which requires detailed understanding and measurements of the brain's electromagnetic activity. It requires a significant measurement protocol. ...

Cogno. This effort by its very nature will directly affect the cognitive aspects of the individual by externally applied electromagnetic fields by implanting information for the individual. Thus, this effort can lead to increased learning and other cognitive results.

Like most government reports on subjects involving classified research or weapons, there is seldom hard evidence. Dr. Asher likewise describes future military research with no citations. No further information on Norseen's research has been reported in the news after the 2002 article. The NASA public affairs office has subsequently reported they do not have plans to pursue airport neurosensing technologies and do not have mind reading capabilities. Norseen's research was described as futuristic and promising, according to the

US News account. For the research to just disappear after 2002 is an indication that Norseen's mind reading and electromagnetic radiation bioeffects research went 'black' or became classified. In this way, the government keeps national security-related mind control research almost completely out of the public eye.

[Table of Contents](#)

15. A serious cold war/post cold war problem of excessive secrecy

Understanding how the US secrecy system works is key to understanding the mind control issue. Government secrecy policy is only occasionally in the news and experts across a wide spectrum say there is too much secrecy. The several examples below include, lifelong censorship agreements, government secrecy reforms never adopted, cover stories used by defense contractors and voluntary media censorship of stories with national security implications.

The UPI July 27, 1987 article *'Black budget' thrives under Reagan; Pentagon's secret spending reaches \$25 billion*, by John Hanrahan reported;

"The General Accounting Office reports that under the Reagan administration 223,855 present and former Defense Department officials with high-level security clearances have signed lifelong censorship agreements to submit for advance review written materials, including speeches, testimony and articles to be published."

Former Senator Daniel Moynihan, chairman of the 1997 *Secrecy, Report of the Commission on Protecting and Reducing Government Secrecy* conducted a review of US secrecy rules and called for major reforms which were never adopted.

A *US News & World Report*, March 22, 1993, *Keeping research under wraps*, by Stephen Budiansky, described cover stories used by contractors.

Aftergood [Federation of American Scientist, Secrecy Bulletin editor] and many other critics -- including H-bomb co-inventor Edward Teller -- are pushing for automatic declassification after a set period of time, a policy introduced by President Nixon but reversed under President Reagan. Another proposal would eliminate special access programs, or at least 'black' programs -- SAPs whose very existence is a secret. (A guide to contractors says that cover stories may be established to hide such programs but cautions that they "must be believable.")

Intelligence agencies have asked the media to suppress stories, as reported by Jeffrey Richelson in the 2001 book, *Wizards of Langley*. The book is about the Directorate of Science and Technology at CIA, based on declassified documents. Richelson reported that "in 1972, New York Times investigative reporter Seymour Hersh had learned of the Glomar Explorer's true mission but had agreed to withhold exposing it at the request of DCI [Director of Central Intelligence] William Colby and the cover story had held." It was subsequently reported in a 1975 Los Angeles Times article that the Glomar Explorer was actually excavating a soviet submarine from it's ocean grave.

Richelson explained; "On February 7, 1975, a Los Angeles Times story, ...revealed the project, although the story was pushed onto page eighteen at Colby's request. Similarly, the New York times buried the story on page thirty. Jack Anderson discussed the issue on national television and Colby later wrote, "There was not a chance that we could send the Glomar out again on an intelligence project without risking the lives of our crew and inciting a major national incident."

Jeffrey Richelson's example of withholding a story for national security is not an isolated incident. The May 3, 1992, Washington Post article entitled, *Playing I Spy with that Alleged New openness at the CIA*, by George Lardner Jr.,

PAO [Public Affairs Office, CIA] now has relationships with reporters from every major wire service, newspaper, news weekly and television network in the nation," the report said. "This has helped us turn some 'intelligence failure' stories into 'intelligence success' stories, and it has contributed to the accuracy of countless others. "In many instances" the report continued "we have persuaded reporters to postpone, change, hold or even scrap stories that could have adversely affected national security interests or jeopardized sources and methods."

These powerful government secrecy tools allow classified mind control programs to be conducted out of the

public eye. The classification of electromagnetic weapons for over forty years as discussed in the Council of Foreign Relations reports and other sources illustrates how a cold war/post cold war Manhattan-type program could escape public scrutiny. The 1984 BBC TV documentary with Project Pandora director, Dr. Koslov's denial of nonthermal bioeffects and Dr. Becker's comments on a perfect cover story for a large classified electromagnetic weapons program coupled with the subsequent post cold war government funding of nonthermal bioeffects research completely revealed the government's extensive disinformation efforts, the nonthermal bioeffects cover story. On the issue of mind control, the public can expect little or no information to be available and to be presented with confusing disinformation by government experts and scientists. The public will have the difficult job of determining what is true.

[Table of Contents](#)

16. Post cold war soviet developments; former Duma member Yuriy Lopatin

No new information has surpassed the work of russian lawyer and Duma member, V.N. Lopatin. Below is a brief summary of his dedicated ten years of russian legislative work on banning mind control weapons. Further information is available at www.mindjustice.org under *Russian Translation Project*.

For over ten years, V.N. Lopatin has been prominent and influential in the Russian government. He has advocated the banning of Russian mind control weapons and has taken this cause to the UN. Mr. Lopatin has a law degree, was a member of the state Duma of Russia and is currently a Russian government representative to Japan. His 1999 book, *Psychotronic Weapons and the Security of Russia* includes an outline of the threat of psychotronic weapons and war and the importance of public relations concerning this global threat. Psychotronic weapons include electromagnetic weapons which target the brain and nervous system. He writes of the proposed Russian federal law 'Informational-psychological safety' concerning the protection and defense of rights and lawful interests of citizens and society.

Mr. Lopatin, is mentioned in two unclassified government documents excerpted below, received under a freedom of information act request. A Moscow Russian Public Television program on Oct 6, 1995 entitled *Man and Law, Scientists Discuss Mind Control Technology* included an interview of Lopatin.

State Duma expert Yuriy Lopatin calling for legislation banning illegal development and sale of mind-control devices.

...A State Duma expert, Yuriy Lopatin says: "Psychotronic Technology is spreading illegally. A law banning the illegal development, production, retailing, and spreading of psychotronic devices which influence the minds and behavior of citizens is badly needed." He goes on to say: "The use of the mass media for psychological experiments should be banned and all the state-ordered research in human genetic experiments should be strictly registered." This was approved by Georgiy Georgiyevich Rogozin, first Deputy Head of the Presidential Security Service.

The following russian article excerpt discusses Lopatin's ten year work to ban mind control weapons. February 11, 2000, Segodnya, *The Riders of the "Psychotropic" Apocalypse* by Andrei Soldatov;

The Russian deputies intend to discuss the draft law on information security in the country. This decision arose from the fact that the US allegedly created alot of devices, which can destroy information systems in Russia and influence the population.

According to Segodnya, currently the Duma is actively discussing the draft law on the information-psychological security submitted by Vladimir Lopatin. It is possible that the fruit of ten years of work (the works on the draft law began in 1990) will be discussed in the first reading in April.

...Such laws have never been discussed in any country. But this fact does not embarrass the deputies because they discovered that the enemy, which threatens Russia in this sphere, is dreadful and powerful. Secret methods of information-psychological influence can not only harm a person's health, but also lead to "the loss of people's freedom on the unconscious level, the loss of capability of political, cultural and other self-identification, manipulations with social consciousness" and even "the destruction of a common informational and spiritual integrity of the Russian Federation".

This final article describes Lopatin's visit with US Defense Secretary Richard Cheney and Lopatin's press conference at the National Press Club. See also Bulletin of Atomic Scientist, Jan/Feb. 1991 *Renegade Russians Grab For Military Control* by Jennifer Scheck Lee which reported, "...Yeltsin's September 1990 choice of Lopatin, a former navy officer equivalent to major, to head the republic's new State Committee on Public Security..."

The Xinhua General Overseas News Service;

Xinhua News Agency, October 11, 1990, *US defense secretary to visit Moscow*

Cheney will stop over in London on his way to Moscow and in Paris on the way back. William's also disclosed today that yesterday, Cheney met with a young soviet military 'reformer', Major Vladimir Lopatin, and had a 'private conversation' with him. He declined to reveal the contents of the conversation. Lopatin, who addressed a press conference at the national press club here today, is in the United States on a visit hosted by 'Global Outlook,' a research institute.

Mr. Lopatin is by far, the most powerful and prominent public figure in the world to advocate a ban on mind control weapons.

17. Post cold war developments; US Foreign Military Studies Office

Mr. Timothy L. Thomas is a military analyst at the US Army, Department of Defense, Foreign Military Studies Office, (FMSO), Fort Leavenworth, Kansas. Here is an excerpt from Military Review, September-October 1999, *Human Network Attacks* by Mr. Timothy L. Thomas, posted on the FMSO website at; <http://fmso.leavenworth.army.mil/>

China and Russia, in addition to studying hardware technology, data processing equipment, computer networks and 'system of systems' developments, have focused [on] 'new-concept weapons,' such as infrasound weapons, lasers, microwave and particle-beam weapons and incoherent light sources. ...The Chinese military apparently believes these devices will be used in future war since its doctors are investigating treatment for injuries caused by special types of high-tech or new-concept weapons.

In the past half century the potential for working on the consciousness, psyche or morale of a person, society or the composition of an armed force has grown dramatically. One of the main reasons is the considerable success achieved by many countries in their systematic research in the areas of psychology, psychotronics, parapsychology, other new psychophysical phenomenon, bioenergy, biology and psy-choenergy in the fields of security and defense.

...In fact, the information-psychological factor is so important to the Russian military that it considers the information-psychological operation as an independent form of military activity.

Psychotronics is defined as 'an inter-disciplinary area of scientific knowledge, which, mediated by consciousness and by perceptual processes, investigates distant (noncontiguous) interactions among living organisms and the environment. It studies the energy and information phenomena of such interactions.' See V.D. Tsgankov and V.N. Lopatin, *Psikhotronnoe Oruzhie i Bezopasnost' Rossii*, Moscow 1999.

A psycho-physical (psychotronic) weapon is defined as 'a technically generated means designed to exert an information and/or energy influence on the functions of the human psyche and on the physiological functioning of human organs and systems. It belongs to the category of non-lethal weapons.' See M.I. Abdurakhmanov, V.A. Barishpolets, V.L. Manilov, V.S. Pirumov, *Geopolitika i Natsional'naya Bezopasnost'*, Moscow, 1998

Mr. Thomas' work was cited as an explanation for claims of mind control victims in July/August 1998, Bulletin of Atomic Scientists, All in the (Russian) mind? by Linda Rothstein;

From time to time, the Bulletin gets letters from people claiming to need help because the FBI is controlling their minds through radio waves. Some say their troubles started when they were secretly operated on; others claim that agents inhabit the apartment above, below, or across

the street--from which are directed subliminal messages that cause the letter writer much grief.

Mr. Timothy L. Thomas, an analyst at the Foreign Military Studies Office at Ft. Leavenworth, Kansas, has a term for such assaults on targeted individuals- "psychotronic warfare." And when it comes to developing the tools to succeed in this apparently burgeoning area, he says, the Russians are way ahead. "Information warfare," Thomas explains in the Spring 1998 issue of *Parameters*, is usually aimed at disrupting modes of communication--telephones, satellites, computers, and so on. But what many US advocates of information warfare have not realized is the importance of targeting the human body, the weakest link in the information chain.

[Table of Contents](#)

18. Post cold war soviet developments; Darpa reports by Hudson Institute

Mary C. Fitzgerald is a research fellow at Hudson Institute, a Washington based public policy think tank. Her areas of expertise are defense and national security issues, Russian, Eastern European, and Eurasian studies, Russian military and US military. As reported on the Hudson Institute website at <http://www.hudson.org/>;

Since 1977, Mary C. Fitzgerald has analyzed Soviet/Russian military writings for the DOD [Department of Defense] with a view to defining central concepts in strategy, operational art, and tactics. In addition, she has published the following reports for the US Department of Defense: *Russian Views on Electronic and Information Warfare* (Volumes I and II), Winter 1996; *Russian MOEs for Electronic and Information Warfare*, Fall 1997; *Impact of the RMA on Russian Military Affairs* (Volumes I and II), Spring 1998; and *Impact of the RMA on Russian Military Affairs: Addendum*, Fall 1998.

Mary Fitzgerald has written an annual report for Darpa (Defense Advanced Research Agency) since 1996 which includes a considerable section on psychotronic weapons. The report is listed above as a US Department of Defense report. Dr. Fitzgerald travels to Russia, attends meetings and conferences with military officials and compiles the annual Darpa report on russian weapons. A freedom of information request to Darpa for the 1997 Darpa report entitled, *Russian Views on Electronic and Information Warfare* is still pending after almost two years. Many thanks to Tessa Puglia who found an outline of the 1997 report;

Russian Views on Electronic and Information Warfare

September 1997

For official use only

Thesis

Russian military scientists predict that the new RMA will drive future war toward exploitation of new physical principles, info warfare...

Future war will liberate man from the battlefield and be less physically destructive because its main objectives are to affect the opponent's infrastructure and psychology. Victory will go to the side best able to execute the emerging "Sixth Generation" of warfare.

Overview

I. New Physical Principles

- Geophysical/ecological weapons
- High-frequency radio/electromagnetic wave weapons, infrasonic weapons
- Ethnic weapons
- Directed-energy weapons
- Psychotronic weapons
- Plasma weapons
- Non-lethal weapons
- Cost-effective
- Secrecy/surprise...

IV. New Physical Principles

High-frequency wave weapons (infrasonic weapons)

- Attack all life-sustaining physiological functions (circulatory and nervous systems, internal organs, etc.)
- Alarm, desperation, horror
- Mass onset of epilepsy, heart attacks, death
- Penetration of concrete, metal structures...
- Detect, monitor, protect against bio-emissions

IX. New Physical Principles

- Directed, non-contact EM fields in SHF/EHF bands
- More dangerous than atomic, etc.
- Suppress willpower/impose "criminal will"
- Radio waves disrupt brain, central nervous systems
- Infrasonic waves = fear, panic, etc.
- Directed irradiation = EM fields from electronic equipment
- Changes behavior, reactions to events
- Disrupts functional systems
- Causes morphological changes in cell tissue
- Penetrates brick, wood, concrete

X. New Physical Principles

- ..."Holographic laser"
- Radiation generator, receiver, device to transform reflected signals...
- Current phase based on artificial intelligence, expert systems, neural networks, transputers using "acquired" knowledge

"Most important objective may be affecting enemy's psychology"

- Individual, collective, mass
- Direct or indirect
- Destroy institutions, create mass disorder, etc.
- "Psychological weapons": psychotronic, psychotropic, infrasonic, electromagnetic...

III. Conclusions

New operations: "Supersystems" = jointness

- ...New Military-Technical Policy: "technological deterrence" = shift from material - to science-intensive
- Space-based C3I/EW = "supersystems"

Reliable information on russian mind control weapons is difficult to find. Mr. Lopatin, like Dr. Adey and Dr. Becker, is one of the few who have spoken out. With the breakup of the Soviet Union much more information on russian mind control weapons became available. While the long-term US/Russian interest in the weapons continues, less information is publicly available as seen in the very few military analysts who are writing about China and Russian electromagnetic weapons and mind control. This combination of factors is an indication of the very heavy classification and importance of the weapons.

[Table of Contents](#)

19. Final analysis; how advanced are US/Russian mind control weapons?

The seriousness of the issue of mind control becomes apparent in the comparison to the atomic bomb. The atomic bomb was public information almost from the start. Nuclear protesters and the general public could express their views on the atomic bomb, international arms control treaties are in place. Mind control and electromagnetic weapons have been heavily classified for over forty years and never publicly used, while being described as powerful as the atomic bomb by many experts. The classified electromagnetic weapons are completely lacking in any evaluation by human rights groups for international treaty compliance and lack any public input or scrutiny.

Advances in neuroscience

The US government today is very interested in decoding the brain, as seen in the proposed human cognome project and funding of neuroscience research for military purposes described in the three new government programs. Government funding and interest in neuroscience and weapons which target the brain and nervous system began during the cold war. After the break up of the Soviet Union, nonthermal bioeffects research funding has expanded significantly and now many of the 2004 government reports strongly recommends and/or is funding further research, in large part for military purposes.

For decades, few breakthroughs for electromagnetic weapons or mind control have been reported and promising research seems to go 'black'. Accidental rare glimpses of classified mind control research have occurred, such as the scandal of 1950s and 60s CIA Mkultra mind control programs exposed in 1970s congressional hearings. The CIA mind control programs have continued in another 1970s supersecret program, according to the Washington Post. One can conclude that Mkultra was successful since experiments continued, despite CIA's half truths that MKultra had ended.

The 1970s Darpa's Richard Cesaro's public claims of success with microwave radiation mind control on monkeys for Project Pandora were never followed up and contradicted the Project Pandora official findings of no nonthermal bioeffects. Lockheed Martin's John Norseen and his 1990s electromagnetic brain signals demonstrations for airport terrorist mind-reading with no follow up research by NASA also illustrate how successful mind control research for national security is moving into classified or 'black' government programs. This long-term government involvement and mind control research going 'black' points to an extensive mind control program, and indicates mind control is one of the deepest secrets of the nation.

Nonthermal bioeffects controversy

Dr. Robert Becker and Dr. Ross Adey's careers in bioelectromagnetism have been exemplary. At a time when few challenged government policies on nonthermal effects of electromagnetic radiation, they publicly spoke out over the years. Dr. Becker lost government funding as a result, while Dr. Adey conducted classified electromagnetic mind control government research. Dr. Becker's books document the long history of the nonthermal bioeffects controversy. Dr. Adey's congressional speech, papers, books and public comments directly challenged military and corporate interests so that a factual record is available.

Avoiding lawsuits would not explain the manner and extent that the US government denied nonthermal effects during the cold war as explained by Dr. Becker and Dr. Adey, especially given the post cold war expansion of development of US weapons based on nonthermal effects. Dr. Becker was right, the denial of nonthermal bioeffects was a perfect cover story for a large, classified electromagnetic weapons program as seen in post cold war government documents. Dr. Adey's question, "How stupid does the US Air Force think the public is?" illustrates how effective the government's suppression of information is. Most people have never heard of the nonthermal bioeffects controversy or that it was a cover story for cold war classified electromagnetic weapons programs.

This post cold war government record clearly illustrates that the nonthermal bioeffects of electromagnetic radiation are the nexus between electromagnetic weapons and some government neuroscience research. The research programs were interconnected throughout the cold war as a result of nonthermal bioeffects; the basis for some electromagnetic radiation neuroscience research and electromagnetic weapons. Now post cold war analysis gives new meaning to the cold war historical record, that mind control and nonthermal bioeffects weapons research were and are extremely important to national security. New neuroscience research is funded in 'Apollo-like' programs by the military, also indicating just how consequential neuroscience breakthroughs are to national security.

Russian mind control

Like Dr. Becker, the former russian Duma member, V.N. Lopatin warned the public about new weapons in his 1999 book. The very few advocates for control of the new weapons and the very few unclassified sources of information on russian mind control weapons, such as the US Foreign Military Studies Office articles and the Hudson Institute reports for Darpa, (Defense Advanced Research Projects Agency), is another in a list of indications that mind control is a substantial national security issue.

With a closer look and new post cold war russian information, evidence of a mind control arms race emerges. The historical evidence of the long-term russian interest in electromagnetic weapons as seen in 1970s UN documents and the long history of the nonthermal bioeffects controversy, a prominent russian spokesman proposing legislation to ban russian mind control weapons and the post cold war russian interest

in mind control weapons, all surrounded by much secrecy, is considerable evidence of major mind control weapons programs in both Russia and the US. The long-term demonstrated importance of mind control to national security indicates a continuing cold war/post cold war mind control arms race.

Government secrecy

Most people are unaware of the extent of government secrecy. Any research related to mind control and electromagnetic weapons or technologies has been promptly classified and has resulted in a lack of publicly available and reliable information on the issue. In fact, government disinformation is created by government control of research funding, influencing of media information and scientists' use of cover stories for national security issues. Two of the same examples illustrating mind control programs that went 'black' are also illustrative of government disinformation surrounding mind control. The CIA's half-truth about the Mkultra research stopping when in fact it was transferred to a supersecret research project is a clear example of government lying and misinformation. The government's cover story and denial of nonthermal bioeffects for fifty years and Project Pandora's official findings of no nonthermal bioeffects, in light of post cold war government funding of nonthermal bioeffects is clear evidence of government disinformation and also devastating to fifty years of scientific research of public health effects caused by exposure to electromagnetic fields, as few of the epidemiology studies needed have been undertaken.

The public is left to ponder a complex and controversial issue with little hard evidence. And further, there obviously can be no public trust in government concerning mind control when scientists and government officials are on the record for repeatedly using cover stories, lying about mind control research and suppressing unclassified nonthermal bioeffects and mind control research while heavily funding similar classified research.

The goal of the government secrecy system is to keep weapons program and capabilities, plausibly deniable and out of the public's view. With prolonged and extensive US government efforts, that goal has clearly been met for mind control and electromagnetic weapons. Today, the alleged government cover story is that victims are simply mentally ill and there is no need to investigate further. Mainstream press repeatedly dismiss the claims as conspiracy theories. Everyone can agree national security is vital but excessive secrecy that allows MKultra mind control experiments, radiation experiments and now allegations of illegal government mind control experiments without further investigation is especially egregious.

[Table of Contents](#)

20. Conclusion

Are nonlethal electromagnetic weapons fully developed mind control weapons? Most people do not believe the US and Russian governments have weapons that can remotely target a person anywhere in the world, read their thoughts, beam messages to their brain, control every nerve in the body and cause great pain. But most people are unaware of new post cold war government funding of mind control programs, the long US/ Russian cold war/post cold war history of nonthermal bioeffects weapons and neuroscience developments, and government secrecy surrounding mind control research; information essential in the evaluation of allegations of illegal government mind control experiments. The numerous facts over an extensive time period add up to an emerging picture. The information presented here does provide direct evidence of the development of classified weapons to target the brain and body by major nations, but to what extent is not publicly known.

While there is no direct proof, it is likely that mind control weapons are highly advanced. There is evidence to support the cold war development of a group of electromagnetic mind control weapons more powerful than the atomic bomb but details are scarce. A Manhattan-type program is no longer science fiction according to scientists who authored the NSF's 2002 Converging Technologies report; "With the convergence of new science technologies, science would become ready to succeed in a rapid program to understand the structure and functions of the human mind, The Human Cognome Project." (underline added.) At the least, post cold war programs are expanding, therefore advanced mind control weapons seem certain in the near future.

[Table of Contents](#)

21. Mind Justice's position

Mind Justice has gathered victim allegations and evidence that nonthermal bioeffects of electromagnetic radiation and government mind control research have been developed and are being tested on citizens around the world without their consent. Over 2,000 alleged victims from around the world have contacted Mind Justice since 1996. The information in this paper refutes the cover story of mental illness and conspiracy and a thorough, impartial investigation is warranted.

A brief summary;

1. over forty years of classified cold war electromagnetic weapons research in Russia and the US, with experts citing excessive secrecy surrounding the weapons,
2. the long cold war/post cold war history of nonthermal bioeffects of electromagnetic radiation in Russia/US, as a US cold war cover story and a post cold war about-face of US scientific policy for nonthermal bioeffects,
3. nonthermal bioeffects of radiation is the scientific basis for developing a group of weapons more powerful than the atomic bomb, experts say,
4. new neuroscience research and electromagnetic weapons funding by the US government after the break up of the Soviet Union,
5. only a handful of advocates who have spoken out about classified government electromagnetic weapons development in US and Russia,
6. the national security motive and extreme measures used to protect the US,
7. billions of national defense dollars available for weapons involving national security,
8. an all-encompassing government secrecy system, control of scientific research funding, control of flow of media information, cover stories/disinformation by scientists and government officials,
9. history has shown that national security and federal law favors weapons development with a total disregard for human subjects of classified experiments,
10. the history of CIA mind control and wide-scale government radiation experiments went unpunished and no new protections for human subjects of secret experiments were passed after the 1990s expose of radiation experiments related to the development of the atomic bomb,
11. the allegations of mind control experiments is growing worldwide, the alleged cluster of symptoms matches the capabilities of neuroscience and weapons research; numerous experts are calling for an investigation,
12. the advanced mind control technology is way beyond the resources of a person to document, both technically and financially and while a few victims have detected signals and some have documented evidence there is no evidence tied to the government perpetrators and,
13. inadequate government whistleblower laws are now in place so that government abuse is highly unlikely to be exposed, according to Government Accountability Project, www.who.int/whistleblower.org.

[Table of Contents](#)

22. A successful model for overcoming excessive government secrecy

As described in the 2001 book, *Secrecy Wars* by Professor Philip H. Melanson, the model of the Assassination Records Review Board was a "highly successful and novel experiment in public disclosure". A citizen panel appointed by the president was given full legal access to all agency records relating to the assassination of President Kennedy and 4.5 million documents were released. Professor Melanson recommends this model for areas in which;

1. There is a historic, long-running subject encompassing both old and new records over a period of

many years or decades.

2. The topic is politically sensitive or contentious.
3. There is a large volume of records.
4. The regular disclosure process is not working, in terms of timeframe, reasonable release, or both(that is, too slow, too much secrecy).

Professor Melanson stated that this model could include the radiation exposure of US troops during atomic testing and experimental testing of unwitting human subjects by US military and intelligence agencies. His book describes the process in detail, including that the boards should have a fixed, four-year term and need a staff component of lawyers who are expert regarding disclosure laws and the secrecy system. Professor Melanson's model is tailor-made for an investigation of alleged illegal government mind control experiments. For further information and ideas, please see, <http://www.mindjustice.org/04-10-31-cahra2mj.htm>

2006 Mindjustice.org Projects

Funded By
Vincent Cano,
Director Angelic-Harp Foundation

[Mind Justice Home Page](#)

In the ten years I have been actively working as director of Mind Justice, this has been the most exciting year of hope and progress. A tremendous thank you to the Angelic-Harp Foundation for providing the encouragement, confidence and grants to make this possible. Two new projects sponsored by Mind Justice will be completed within the next four to six months. Two generous donations from Angelic-Harp Foundation are making these first-ever opportunities possible. The first project will be completed and posted within the next month. Peter Phillips, director of Project Censored at www.projectcensored.org has been working with two independent professional researchers and analysts of Media Freedom Foundation on an academic paper. The topic is advanced neuroresearch and the possible threats and risks to society.

The Project Censored article will examine human experiments, the development of electromagnetic weapons and the threat to our society. As it has turned out, the January 14th 2007 [Washington Post Magazine](#) article on mind control victims will be a compliment to the Project Censored article. A Project Censored abstract of the article will be sent to media outlets and posted on the Project Censored website.

Professor Phillips has given permission to post and disseminate the article by anyone interested. The article, ***US Electromagnetic Weapons and Human Rights*** By Peter Phillips, Lew Brown and Bridget Thornton will be available on the Project Censored website at <http://www.projectcensored.org>. Look for this paper after January 1st, 2007.

Mind Justice had no editorial control over the paper but I did my best to provide a wide variety of views and information. The interns extensively reviewed information available on the internet.

In September, I sponsored a special 'thank you' dinner for Vincent Cano, director of Angelic-Harp Foundation and the two independent professional researchers and analysts of Media Freedom Foundation, Senior Research Director, Lew Brown and Bridget Thornton. Lew and Bridget, with their constantly positive attitudes, have been working overtime on the research for this article since June. Earlier that day, Mike Duffey, Betsy Manning, Jim McCue and others met for two hours with Lew and Bridget so that they could put a human face on the issue. As a result, future studies and projects with Lew and Bridget may possibly be forthcoming.

How can an academic paper help victims and targeted individuals? Of course, other projects are needed to relieve the torture experienced by victims and should be a primary goal, I believe. And it is true that convincing experts such as Project Censored our claims are real is still in the future. The goal of this paper was for a nonvictim experts, i.e. Project Censored, to review the mind control research and to provide credible, reliable information so that the public will better understand the issue.

It took much searching before I found anyone willing to touch this issue. Professor Phillips is unique in that respect and one of the busiest people I have met, always busy working on several media projects. He not only talks but he follows through with hard work. As a result of this paper, other experts, including shielding experts may more readily take this issue seriously and participate in future projects.

The second project will run from November 1st through May 1st 2007. I can't name the scientist until the project is complete but he is a prominent expert in electromagnetic and magnetic bioeffects. He has published several articles and a college course book on the topic. He is well aware of the political and military factors that influence EMF research. The published article entitled *Bio-electric Terrorism* posted on my website at <http://mindjustice.org/russian8-06.htm> was provided to Mind Justice by this scientist. And he has networked with the famous EMF expert, Dr. Ross Adey.

This scientist has agreed to the following: to make a thorough and unbiased review of published materials from the viewpoint of theoretical and experimental physics, based on his experience in EMF-Bio effects. A 20-30 page paper an analytical study focused on the State-of-the-Art in the 'Electromagnetic mind-control' and 'Electromagnetic weapons'.

I will be posting the final paper on my website. Efforts to publish the article are planned. EMF weapons are heavily classified and human rights experts have little information on the weapons, let alone the science behind the weapons. This paper will be a big step forward in dispelling the myth that EMF mind control weapons are future technologies. And again, with this paper, experts may be more willing to take this issue seriously and participate in future projects.

Electromagnetic Radiation (emr) Weapons: As Powerful As The Atomic Bomb

By Cheryl Welsh, president
Citizens Against Human Rights Abuse,
Copyright Feb. 2001

[Mind Justice Home Page](#)

Endorsement of this paper by Dr. Rosalie Bertell, who has a doctorate degree in Biometry, the design of epidemiological research and the mathematical analysis of bio-medical problems. Dr. Bertell documented military microwave zapping of Greenham Commons women nuclear protesters in the 1980s as reported in London Guardian March 10, 1987. She authored UN reports on the Chernobyl disaster, has five honorary doctorates, numerous peace prizes and more. In an email dated 3-12-01, Dr. Bertell stated,

Date: Mon, 12 Mar 2001 18:27:42 -0500

Dear Cheryl, I have received your document and I think you have enough information for a documentary report or an article by an investigative reporter. It may raise concern about the issues, but does not prove anything. [Dr. Bertell is referring to the document , EMR Weapons: As Powerful as the Atomic Bomb]. ...There is some confusion about weapon use and harassment or experimental use, with the latter being harder to document. The health effects which can be attributed to EMR weapons is also, as you know, not established. Your problems are quite similar to that of the atomic bomb victims, including the military, the Japanese and those living downwind of a nuclear test site. Very few of the experienced health effects have ever been admitted. We also deal with the same denial and secrecy with the Gulf War, Bosnia and Kosovo vets exposed to ceramic DU...

Fifty years of an East/West scientific controversy reveals a still classified cold war secret; nonthermal emr weapon effects are the basis for massive East/West mind control projects

The 1989 Breakup of the Soviet Union leads to US admission of classified mind control technology and exposes massive Russian mind control arsenal

US government takes extreme measures to keep this powerful weapon under wraps; refuse to acknowledge alleged weapon testing on US citizens, while Russian government admits to mind control weapons and experiment victims take their case to the Russian government, the Duma and Soviet press

After fifty years, the truth is now out: Control of your mind is a military capability

What follows are the supporting facts from several independent and reputable mainstream publications and experts.

As a result, the horrific human rights abuses of illegal and classified experiments in the US and Russia continuing to this day are becoming public knowledge.

Electromagnetic Weapons: As Powerful As The Atomic Bomb

Outline of paper with footnotes

I. A fifty year electromagnetic arms race between Russia and the U.S.: Russia & East Block say nonthermal electromagnetic biological effects used for new weapons, U.S. policy says emr nonthermal effects not proven.

Electromagnetic Weapons: As Powerful As The Atomic Bomb

A fifty year electromagnetic arms race between Russia and the U.S.: Russia & East Block say nonthermal electromagnetic biological effects used for new weapons, U.S. says nonthermal emr effects are not proven.

- 10 July 1979 Committee on Disarmament 1-52, V.L. Issraelyan, Representative of the USSR to the Committee on Disarmament. "Assessments quoted in international literature of the potential danger of the development of a new weapon of mass destruction are based on the results of research into the so-called "non-thermal" effects of electromagnetic radiation on biological targets. These effects may take the form of damage to or disruption of the functioning of the internal organs and systems of the human organism or of changes in its functioning."
- H.P. Schwan was a German scientist who came to the US under a military recruitment program after the war. He has worked at the University of Pennsylvania on numerous government contracts and set the first health and safety standards for electromagnetic radiation, adopted by the US government. In *Physical Properties of Biological Matter: Some History, Principles, and Applications* by Herman P.

Schwan, 1982. "...Rajewsky and I had published a paper on the conductivity of erythrocytes, reporting, for the first time, dielectric measurements on biological materials extending up to 1,000 MHz. ...I mention all of these things to indicate the decisive role that the Navy and NIH played. Navy support has been available to me, in one form or another, ever since 1947, and NIH support since 1952." The book continues, "...While a young physics student, financial problems forced me to interrupt my studies until I found employment as an electronics technician at the Oswalt Institute for Physics in Medicine, now the Max Planck Institute for Biophysics....cell membranes are not likely to be affected directly by microwaves since fields of interest can only apply potentials across the membranes that are vanishingly small in comparison with potentials needed to yield significant membrane responses. And significant responses of biopolymers require field strength levels very much higher than those causing undue heating." Schwan has worked extensively in the biomedical engineering field. He has claimed up to the 1990s that the nonthermal effects of electromagnetic radiation have not been proven.

- H.P. Schwan's March 22, 2000 email response to the issue of classified electromagnetic, neurological weapons stated. "I am not aware of military antipersonnel weapons using em radiation. There was alot of talk about it some years ago. I believe the potential for such weaponry is small since em radiation field strength decreases inversely with the distance square in the "distant" field.
- *Washington AP*, May 22, 1988, Barton Reppert Associated Press Writer, *Looking at the Moscow Signal, the Zapping of an Embassy 35 years later, The Mystery Lingers*. Reppert stated, " Since the early 1980s, however, federal government support for non-ionizing radiation bioeffects research has declined markedly. W. Ross Adey, a leading researcher based at the Veteran's Administration Medical Center in Loma Linda, Calif., told a House subcommittee last Oct. 6 that current levels of government funding -now about \$7 million a year- are "disastrously low. There is reason to believe that this situation has arisen in part through a well-organized activity on the part of major corporate entities from the consumer and military electronic industries to discredit all research into athermal biological and biomedical effects," Adey said"
- *Neurological Research*, Vol. 4, No 1/2, 1982, Dr. Ross Adey, "It is now well established that intrinsic electromagnetic fields play a key role in a broad range of tissue functions including ...information transmission in the nervous system."
- Dr. Stefan Possony was a Hoover Institute fellow and was called "the intellectual father of 'Star Wars' and "one of the most influential civilian strategic planners in the Pentagon" (*Guardian*,1995,17). Dr. Possony wrote about "messaging directly into a target mind" with low frequency waves. *Defense & Foreign Affairs*. P.34(1983,July), "Scientific Advances Hold Dramatic Prospects for Psy-Strat", Possony, Stefan. "Associate Editor Dr. Stefan Possony discusses how scientists are facing the prospect of messaging directly into a target mind. Whither psy-war? Suppose it becomes feasible to affect brain cells by low frequency waves or beams, thereby altering psychological states, and making it possible to transmit suggestions and commands directly into the brain. Who is so rash as to doubt that technological breakthroughs of this general type would not be put promptly to psyops use? More importantly who would seriously assume that such a technology would not be deployed to accomplish political and military surprise? A few years ago there was much excitement about the Soviet microwave "bombardment" of the US Embassy in Moscow. Why did the KGB, then under Yuri Andropov's leadership, embark on this seemingly scurrilous -- and very prolonged --effort? There was no answer to this question, except that the KGB must have wished to harass US diplomats and cause them to worry about their health. This theory was never convincing. The question was raised whether the Soviets had discovered a technique of using microwaves for psychological purposes, and whether they were experimenting with this technique on US specialists on the USSR, unwittingly pressed into Soviet service as guinea pigs. Impossible, replied the State Department, the waves cannot break through the blood-brain barrier, and thermal effects are so negligible that the body would not be affected. Nevertheless, embassy personnel were indemnified for health damage. By 1979, at the latest, it was known that electromagnetic fields raising body temperatures less than .1 degrees Celsius may result in somatic changes. It was most surprising that such a trivial temperature rise was having any effects, and even more astonishing that those effects were significant. Chemical, physiological and behavioral changes can occur within "windows" of frequency and energy continua. Another is at the level of the human electroencephalogram (EEG), which is in the range of extremely low radio and sound waves, around 20 Hertz. Let us cut the story to the minimum. The original model, according to which the blood-brain barrier cannot be broken, was derived from the axiom that

electromagnetic waves interact with tissue in a linear manner. However, it turned out that the molecular vibrations caused by a stimulating extracellular electromagnetic field are non-linear. In the US, the pioneering work seems to have been done by Albert F. Lawrence and w. Ross Adey, writing in *Neurological Research*, Volume 4, 1982."

- *Defense & Foreign Affairs Daily*, June 7, 1983. "On April 29, 1983, Associate Editor Dr. Stefan Possony, addressing the Defense 83 meeting sponsored by Defense & Foreign Affairs, reported on Dr. Adey's work and on the work by Dr. A.S. Davydov of the Ukrainian Academy of Sciences. Davydov discovered how the blood-brain barrier can be penetrated by low frequency beams and directly affect cells in the brain. Possony's remarks were delivered to a panel studying psychological warfare. [Part of that paper is printed below--Ed.] In the US research on direct brain waves has scarcely begun, and the USSR has a lead of approximately 25 years. Once it is matured the new technology will be extraordinarily significant in medicine. It also may have major impacts on communications, intelligence, and psychological operations, and permit deliberate physiological impairment. The KGB is known to be interested in the program. It is not known whether the US and other Governments are trying to determine whether their countries have become targets of clandestine brain waves beamed from the USSR.

Suppression of nonthermal emr research by US government and emr industry for fifty years is documented

- *Microwave Debate* by Nicholas Steneck, 1984, MIT Press, page 84. Following the UCLA conference, the military, which controlled the RF bioeffects pursestrings and therefore made the major policy decisions, decided both to fish and cut bait. Publicly talk of athermal effects was downplayed. Open contracts were not awarded for athermal or central nervous system studies, and in fact efforts were even made to keep information about central nervous system research from circulating too widely. Privately, however, the military and the State Department began work to try to determine whether there was any factual basis for a belief in the direct effect of RF radiation on human behavior and whether perhaps the Soviets had gotten the jump in exploiting such effects for espionage and military purposes. The primary motivation for the work was a desire to find out the purpose of a beam of microwave radiation that was being directed at the U.S. embassy in Moscow. This and all subsequent information on the UCLA meeting is taken from the unpublished minutes: "Neurological Responses to External Electromagnetic Energy (A Critique of Currently Available Data and Hypotheses)," co sponsored by the Brain Research Institute, UCLA and the Air Force Systems Command, July 11, 1963, USAF Contract 18(600)-2057.
- *Zapping of America* by Paul Brodeur, 1977. [The following comments are by Milton Zaret, an ophthalmologist who was paid by the Air Force to examine the eyes of military radar technicians in 1959. Zaret has documented that the posterior capsular cataract was a "marker disease", "a medical indication", of sustained exposure to low-level microwaves. This finding was hotly disputed by the military. After Zaret published these findings, the Air Force announced it had no intention of pursuing the matter. Dr. Zaret is now bitterly suspicious of the military's motives in this whole business. Zaret believes that the military is eager to suppress studies of low-level microwave hazards.] "By this time, I had been approached on a number of occasions by the Central Intelligence Agency. The contacts were innocuous to begin with. At first, the CIA people wanted to know about research I had performed on the ophthalmological effects of microwave and laser radiation. They also wanted me to analyze some of the foreign and American literature on the subject of radiation for them. In 1964, however, they started asking me about the possible behavioral effects of microwaves. They wanted to know, for example, whether I thought that electromagnetic radiation beamed at the brain from a distance could affect the way a person might act. I said that from what I had read primarily in Soviet literature on the subject it seemed conceivable. During 1964 and 1965, I had a number of visits from a medical doctor who worked for the agency. He wanted to know if a device that took pictures at night with an invisible laser beam instead of a conventional flashbulb was safe to use. When I exposed the eye of a rabbit to the beam I found that it produced an immediate retinal hemorrhage, so I told him that in my opinion the device was not safe. He also wanted answers to a number of theoretical questions. For instance, would a laser beam directed at a listening device planted on a windowsill be liable to injure anyone inside the room that was being bugged? And could microwaves be used to facilitate brainwashing or to break down prisoners under interrogation?"
- *Trial 8-90* page 32, Bruce H. DeBoskey, "Non-Ionizing Radiation: Hidden Hazards". It summarizes the

litigation surrounding prolonged exposure to NIEMR or non-ionizing electromagnetic radiation. This is a good reference article and it demonstrates the difficulty involved in court cases filed by victims. The article stated "the potential for hazards from NIEMR has long been known to the industries involved." "...Some industries have been funding research designed to show the absence of harm to workers or the general public."

Fifty years later, nonthermal effects of emr are the scientific basis for weapons and biological basis of brain function, human rights professionals, military, civilian and top government science advisor say

- *International Review of the Red Cross* 279, 1, Nov. 1990 entitled "The Development of New Antipersonnel Weapons by Louise Doswald-Beck and Gerald C. Cauderay. " Directed Energy Weapons. ...Research work in this field has been carried out in almost all industrialized countries, and especially by the great powers, with a view to using these phenomena for anti-materiel or anti-personnel purposes. ...It is possible today to generate a very powerful microwave pulse (e.g., between 150 and 3,000 megahertz), with an energy level of several hundreds of megawatts. Using specially adapted antenna systems, these generators could in principle transmit over hundreds of metres sufficient energy to cook a meal. However, it is important to mention that the lethal of incapacitating effects which can be expected from weapons systems using this technology can be produced with much lower energy levels. Using the principle of magnetic field concentration, which permits the control of the geometry on the target, by means of antenna systems especially designed for the purpose, the radiated energy can be concentrated on very small surfaces of the human body, for example the base of the brain where relatively low energy can produce lethal effects....In spite of the rarity of publications on this subject, and the fact that it is usually strictly classified information, research undertaken in this field seems to have demonstrated that very small amounts of electromagnetic radiation could appreciably alter the functions of living cells. Research work has also revealed that pathological effects close to those induced by highly toxic substances could be produced by electromagnetic radiation even at very low power, especially those using a pulse shape containing a large number of different frequencies. ...Some research seem to have confirmed that low-level electromagnetic fields, modulated to be similar to normal brainwaves, could seriously affect brain function. Experiments with pulsed magnetic fields carried out in animals have reportedly produced specific effects such as inducing sleep and triggering anxiety or aggressiveness, depending on the modulation of the frequency used. It is, on the other hand, well known that lethal effects can also be produced by using higher power levels than those used for the experiments on behaviour modification. An anti-personnel weapon based on such biophysical principles could produce similar effects to those of a nerve gas, but would have no secondary effects and leave no lasting trace."
- *US News & World Report*, 7-7-97, "Wonder Weapons", an article on emr weapons by Douglas Pasternak, page 40. "In fact, the military routinely has approached the national Institutes of Health for research information. "DARPA (Defense Advanced Research Projects Agency) has come to use every few years to see if there are ways to incapacitate the central nervous system remotely," Dr. F. Terry Hambrecht, head of the Neural Prosthesis Program at NIH, told U.S. News. "But nothing has ever come of it," he said, "That is too science fiction and far-fetched."
- *US News & World Report*, Jan3/Jan 10 2000, Page 67, "Reading your mind and injecting smart thoughts", John Norseen, "The Lockheed Martin neuroengineer hopes to turn the "electrohypnomentalphone," a mind reading machine...into science fact. Norseen's interest in the brain stems from a Soviet book he read in the mid-1980s, claiming that research on the mind would revolutionize the military and society at large. The former Navy pilot coined the term "BioFusion" to cover his plans to map and manipulate gray matter, leading (he hopes) to advances in medicine, national security, and entertainment. BioFusion would be able to convert thoughts into computer commands, predicts Norseen, by deciphering the brain's electrical activity. electromagnetic pulsations would trigger the release of the brain's own neurotransmitters to fight off disease, enhance learning, or alter the mind's visual images, creating what Norseen has dubbed "synthetic reality." ...The key is finding "brain prints." "Think of your hand touching a mirror," explains Norseen. "It leaves a fingerprint." BioFusion would reveal the fingerprints of the brain by using mathematical models. "Just like you can find one person in a million through fingertips," he says, "you can find one thought in a million. "It sounds crazy, but Uncle Sam is listening. The National Aeronautics and Space Administration, the Defense Advanced Research Projects Agency, and the Army's National ground Intelligence center have all awarded small basic research contracts to Norseen, who works for

Lockheed Martin's Intelligent Systems Division. Norseen is waiting to hear if the second stage of these contracts--portions of them classified--comes through. Norseen's theories are grounded in current science. ...By viewing a brain scan recorded by a magnetic resonance imaging (MRI) machine, scientists can tell what the person was doing at the time of the recording--say, reading or writing. Emotions from love to hate can be recognized from the brain's electrical activity. "It this research pans out, says Norseen, "you can begin to manipulate what someone is thinking even before they know it." Thought police. He has submitted a research-and -development plan to the Pentagon, at its request, to identify a terrorist's mental profile. A miniaturized brain-mapping device inside an airport metal detector would screen passengers' brain patterns against a dictionary of brain prints. Norseen predicts profiling by brain print will be in place by 2005. ...Norseen would like to draw upon Russian brain-mimicking software and American brain-mapping break-through to allow that communication to take place in a less invasive way. A modified helmet could record a pilot's brain waves. ...If the pilot misheard instructions to turn 090 degrees and was thinking 080 degrees," the helmet would detect the error, then inject the right number via electromagnetic waves. If this research pans out, say Norseen, "you can begin to manipulate what someone is thinking even before they know it."

- *US News & World Report*, Jan 3-10, 2000, Page 68, Rodolfo Llinas. "A grand unification theory of the brain" . "...Using a Meg--a technology Llinas helped develop--he has been studying the brain's electromagnetic waves. What he has found in broad paraphrase is that the thalamus is in constant dialogue with the brain's higher processing centers: An electromagnetic loop sends pulses from the thalamus to the cortex, but the different sensory centers of the brain also message the thalamus in return. Consciousness exists when these oscillations are in sync--pulsing at the same rate--so smells, sounds, and so forth assemble in a kind of electromagnetic symphony."
- Freeman Dyson of the Institute for Advanced Study at Princeton is a physicist and was quoted in the Bill Joy article in April 2000 *Wired Magazine* on the dangers of technology. Dr. Dyson coined the word "radiotelepathy", i.e. "something like a cordless phone inside your head" Dyson wrote this comment. "After the organization of the central nervous system has been explored and understood, the way will be open to develop and use the technology of electromagnetic brain signals." This quote was from *International Herald Tribune*, Rudy Rucker, April 25, 1997 page 4, book review of *Imagined Worlds*,
- Freeman Dyson was a member of the elite Jason Division, the 40-odd leading scientists-including some Nobel laureates, -who in 1959 and 1960 banded together to work on national security matters in the summertime under the aegis of the Institute for Defense Analyses (IDA). Jason originated as an enabling mechanism to keep younger physicists in touch with defense problems, but it rapidly evolved into a club. "We were all bright young men together; we were all precocious 30 years ago," recalled Dyson. (Excerpt from *Science*, February 1973 page 460.)
- In reply to a question by email from Cheryl Welsh, concerning classified brain research on March 18, 2000, Freeman Dyson wrote, " Nothing important in science stays secret for long. ...The Russians had hundreds of secret projects.... Luckily we are not so good as the Russians at hiding stupid stuff. So stop worrying about imaginary scares. ..One of my friends ...cures his patients with magnets. ...But this had nothing to do with science."
- *Wired magazine*, April 2000, article on the peril of technology. Nearly 20 years ago, in the documentary "The Day after Trinity", Freeman Dyson summarized the scientific attitudes that brought us to the nuclear precipice: "I have felt it myself. The glitter of nuclear weapons. It is irresistible if you come to them as a scientist. To feel it's there in your hands, to release this energy that fuels the stars, to let it do your bidding. To perform these miracles, to lift a million tons of rock into the sky. It is something that gives people an illusion of illimitable power, and it is, in some ways, responsible for all our troubles-this, what you might call technical arrogance, that overcomes people when they see what they can do with their minds."
- Dyson, Freeman, 1997, *Imagined Worlds* President and Fellows of Harvard College. Acknowledgments. "This book grew out of a set of lectures given in May 1995 at the Hebrew University of Jerusalem... ...The idea of radiotelepathy first appeared, so far as I know, in the science-fiction novel Last and First Men, written by Olaf Stapledon, in 1931, ...in which the cells of a multicellular creature communicate with each other by means of electric and magnetic fields... The chief barrier to progress in neurophysiology is the lack of observational tools. To understand in depth

what is going on in the brain, we need tools that can fit inside or between the neurons and transmit reports of neural events to receivers outside. ...observing instruments...with rapid response, high band-width and high spacial resolution...There is no law of physics that declares that such an observational tool to be impossible. We know that high-frequency electromagnetic signals can be propagated through brain tissue for distances of the order of centimeters. We know that microscopic generators and receivers of electromagnetic radiation are possible. We know that modern digital data-handling technology is capable of recording and analyzing the signals emerging from millions of tiny transmitters simultaneously. All that is lacking in order to transform these possibilities into an effective observational tool is the neurological equivalent of integrated-circuit technology. We need a technology that allows us to build and deploy large arrays of small transmitters inside a living brain, just as integrated-circuit technology allows us to build large arrays of small transistors on a chip of silicon. ...Radioneurology is in principle only an extension of the existing technology of magnetic resonance imaging, which also used radio-frequency magnetic fields to observe neural structures. A rough estimate based on the available band-width indicates that a million transmitters could be monitored through each patch of brain surface with size equal to the radio wave-length. The factor of a million is the ratio between the radio band-width, of the order of hundreds of millions of cycles per second, and the band-width of a neuron, of the order of hundred of cycles...."

US says Russians have mind control emr capabilities

- *Los Angeles Herald-Examiner, The Associated Press*, "Mind-Altering Microwaves, Soviets Studying Invisible Ray," 22 Nov. 1976, Sec A-."A newly declassified U.S. Defense Intelligence Agency report says- extensive Soviet research into microwaves might lead to methods of causing disoriented human behavior, nerve disorders or even heart attacks.... A copy of the study was provided by the agency to The Associated Press in response to a request under the Freedom of Information Act. The Pentagon agency refused to release some portions of the study, saying they remain classified on national security grounds."
- *NBC Magazine with David Brinkley*, July 16, 1981 No. 47592. DB (David Brinkley): "It is known the Russians are working hard on controlling the human mind by remote electronic means. ...As I say I find it hard to believe, it is crazy and none of us here know what to make of it: the Russian Government is known to be trying to change human behavior by external electronic influences. We do know that much. and we know that some kind of Russian transmitter is bombarding this country with extreme low frequency radiowaves. " Garrick Utley: ...The theory is the fact that the brain does emit electronic energy energy which can be harnessed and used. And, by the same token, the electronic field of the brain can be interfered with in order to change-affect human behavior, attitudes, opinions. ...To what extent can you disrupt the mental process, the brain through the use of electronic fields, microwaves? William Bise, radio engineer, "Well I would think that the easiest way to do it would be with microwaves. "
- *Military Review* (official publication of the U.S. Army Command and General Staff College), "The New Mental Battlefield", Lt. Col. John B. Alexander, U.S. Army, Ph.D. [He is a leading proponent of and spokesman for nonlethal weapons. Col. Alexander worked at Los Alamos Lab on nonlethal weapons.] "(Soviet) mind-altering techniques, designed to impact on an opponent are well-advanced. The procedures employed include manipulation of human behavior through the use of psychological weapons effecting sight, sound, smell, temperature, electromagnetic energy, or sensory deprivation." He further stated, "Soviet researchers, studying controlled behavior, have also examined the effects of electromagnetic radiation on humans and have applied these techniques against the U.S. Embassy in Moscow." Also, "Researchers suggest that certain low-frequency (ELF) emissions possess psychoactive characteristics. These transmissions can be used to induce depression or irritability in a target population. The application of large-scale ELF behavior modification could have horrendous impact."

US government claims emr mind control weapons are classified

- *U.S. News and World Report* July 7, 1997, "Wonder Weapons" , page 38; "Scores of new contracts have been let, and scientists, aided by government research on the "bioeffects" of beamed energy, are searching the electromagnetic and sonic spectrums for wavelengths that can affect human behavior." "...Louis Slesin, editor of the trade journal Microwave News stated "That's because the human body is essentially an electrochemical system, and devices that disrupt the electrical impulses

of the nervous system can affect behavior and body functions. But these programs-particularly those involving antipersonnel research-are so well guarded that details are scarce." "People [in the military] go silent on this issue," says Slesin, "more than any other issue. People just do not want to talk about this."

- *Bulletin of Atomic Scientist*, Sept/Oct 1994, "The Soft-Kill Fallacy" by Steven Aftergood, "Details about programs to develop so called "non-lethal "weapons are slowly emerging from the U.S. government's secret "black budget". "...The concept of non-lethal weapons is not new; the term appears in heavily censored CIA documents dating from the 1960s."

Why the public is in the dark about electromagnetic weapons

- *The Washington Post* article by George Lardner, 4-27, 5-3-92, page 34, reported on a 1992 CIA report on *Greater CIA Openness*" Director Joseph DeTrani stated "PAO [CIA's Public Affairs Office] now has relationships with reporters from every major wire service, newspaper, news weekly and television network in the nation, " the report said. "This has helped us turn some 'intelligence failure' stories into 'intelligence success stories, and it has contributed to the accuracy of countless others. "In many instances," the report continued, "we have persuaded reporters to postpone, change, hold or even scrap stories that could have adversely affected national security interests or jeopardized sources and methods,"
- In *The Bulletin of Atomic Scientist* article entitled, *The Soft-Kill Fallacy*, Sept/Oct 94 page 43 Steve Aftergood wrote; "The government secrecy system as a whole is among the most poisonous legacies of the Cold War. ..the Cold war secrecy system also mandates ACTIVE DECEPTION." The article continues, "A security manual for special access programs authorizes contractors to employ "cover stories" to disguise their activities. The only conditions is that "cover stories must be believable." Even the government is starting to recognize that official cover and deception programs are getting out of hand and need to be curtailed. A Joint Security Commission established by the secretary of defense and the director of central intelligence reported in March that "the use of cover to conceal the existence of a government facility or the fact of government research and development interest in a particular technology is broader than necessary and significantly increases costs." One cover story for electromagnetic nonconsensual experimentation is mental illness.
- *Boston Globe*, 7-7-89, Larry Collins, "Can we influence human emotions and behavior? Are there or were such experiments now going on?" William Casey, Director, CIA, "This is not a subject we're going to discuss with you or anyone else."
- *Open Verdict An account of 25 mysterious deaths in the defense industry*, Tony Collins, Sphere Books Ltd., a division of MacDonald & Co. Publishers London, 1990. Twenty five Star Wars Marconi defense workers mysteriously died by suicide and strange accidents in the early 1980s in England. Collins wrote, "This book is about a new type of war, electronic war. ...It is fought by ...research students in universities and electronics engineers working for defense contractors. ...It is a war that must be waged constantly during peacetime to maintain the upper hand. It is a war that must be waged in secrecy." Tony Collins is executive editor of *Computer Weekly*. He worked for the BBC and national newspapers, such as *Sunday Mirror*. The editor of the Collins book, Stephen Arkell described the discrepancies found during his investigation and problems such as the following. "The companies and establishments where they worked are reluctant to give out details of any projects, even those already in the public domain. In addition, there are many other project, so called 'black' projects, which these organizations cannot even officially admit to. The secrecy surrounding the peacetime preparations for a future electronic war ensures that any attempt to prove or disprove a definite work link can be not more than a calculated stab in the dark. ...In May 1989, for example, eleven Russians and four Czechs were expelled from the UK for allegedly trying to obtain highly sensitive information about powerful microchips, radar, laser technology and advanced materials such as titanium and carbon fibres. These agents were reported to have approached the executive of defense contractors in a series of 'cash for secrets' deals. ...Another theory ...concerns the investigation into alleged fraud at Marconi. ...This investigation [by the Ministry of Defense Police] has since resulted in charges being brought, ...However there is not one scrap of evidence to suggest that any of the scientists named in the book were involved in fraud. ...the deaths and disappearances of 28 defense workers is one of the most bizarre and enigmatic stories of the past decade."

- *Hustler Magazine*, June 1989, "Who's Killing the Star Wars Scientists", suggests that "the Russians are using a death ray to drive the scientists to suicide. The British press blames stress. This wave of suspicious fatalities in the ultrasecret world of sophisticated weaponry has not gone unnoticed by the US government. Late last fall, the American embassy in London publicly requested a full investigation by the British Ministry of Defense. (MoD). ...The Pentagon refuses comment on the deaths. But according to Reagan administration sources, "We cannot ignore it anymore."

With the break up of the Soviet Union in 1989, US declassify and promote nonlethal emr weapons which have been classified since the 1960s. Several mainstream Soviet press articles claim Russian top secret and massive mind control technology program in chaos.

Electromagnetic weapons: more powerful than the atomic bomb, scientists say

- *Washington AP*, May 22, 1988 by Barton Reppert Associated Press Writer, entitled, "Looking at the Moscow Signal, the Zapping of an Embassy 35 years later, The Mystery Lingers", Richard S. Cesaro, deputy director for advanced sensors at the Pentagon's Advanced Research Projects Agency, in an interview prior to his death two years ago, contended that "in our experiments we did some remarkable things. And there was no question in my mind that you can get into the brain with microwaves. ...If you really make the breakthrough, you've got something better than any bomb ever built, because when you finally come down the line you're talking about controlling people's minds,"
- *New York Times*, Dec. 29, 1965 p.28 covered speakers at an American Association for the Advancement of Science meeting. Entitled "Controlling the Mind", Professor David Krech of the University of California suggested that probable future capabilities for controlling human minds contain more serious implications than even the successes of the nuclear physicists."
- *Defense Electronics*, July 1993, "DOD, Intel Agencies Look at Russian Mind Control Technology, Claims FBI considered Testing on Koresh", by Mark Tapscott, "In a series of closed meetings beginning March 17 in suburban Northern Virginia with Dr. Igor Smirnov of the Moscow Medical Academy, FBI officials were briefed on the Russian's decade-long research on a computerized acoustic device allegedly capable of implanting thoughts in a person's mind without that person being aware of the source of the thought. ...Officials from the Central Intelligence Agency (CIA) Defense Intelligence Agency (DIA) and the Advanced Research Projects Agency (ARPA) were also present, according to the source. ...The memo went on to note that meeting attendees were also interested in whether "psycho-correction detection, decoding and counter-measures programs should be undertaken by the U.S."
- *The Guardian* "The Future Art of War", May 25, 1995. Nic Lewer, peace researcher at the University of Bradford, in the latest issue of *Medicine and War*, lists "more than 30 different lines of research into 'new age weapons'..." the article further states, "Some of the research sounds even less rational. There are, according to Lewer, plans for 'pulsed microwave beams' to destroy enemy electronics, and separate plans for very-low-frequency sound beams to induce vomiting, bowel spasm, epileptic seizures and also crumble masonry." Further the article states, "There are plans for 'mind control' with the use of 'psycho-correction messages' transmitted by subliminal audio and visual stimuli. There is also a plan for 'psychotronic weapons' - apparently the projection of consciousness to other locations- and another to use holographic projection to disseminate propaganda and misinformation."

Several mainstream Soviet press articles claim Russian top secret and massive mind control technology program in chaos.

- *The Herald (Glasgow)* No reporter listed. "Brainwash killers 'still in use'". , 26 May 1995, 8. "'A TOP-SECRET project in the former Soviet Union in the 1970s turned soldiers and security agents into programmable 'human weapons' and is now being exploited by mobsters and private firms, it was claimed today. The psychological weapons project relied on hypnosis and high-frequency radio waves to turn members of the Soviet security forces and military into fearless, conscienceless fighting machines, said a programme on German television. The Psychotronic Influence System relied on passwords and numbers to activate its subjects. After the KGB project's existence was made public hundreds of former Soviet soldiers, police, and KGB members have sought health damages."

However the programme said some special Russian police units still use the system today and it has found its way on to the free market, where mobs and private security firms are using it, the programme reported."

- *Stolitsa*, Myasnikov, Alexei. "MC-Ultra Program, Use of mind-control equipment by armed forces not ruled out by Moscow-based Foreign Policy Institute." , No.43, 2 Nov. 1992, 40. Also, Copyright 1992 RUSSICA Information Inc. RusData DiaLine Russian Press Digest. "'A certain Human Rights Union demands that the development of mind-control weapons be banned,' writes the STOLITSA weekly. The Union refers to various foreign and local sources and personal evidence to prove that the development of such weapons does take place.... A group of researchers claim that a MC-Ultra (mind-control) program was carried out in the Soviet Union and, possibly, by far outpaced a similar U.S. program.... There is reliable information, the MFPI review says, that the CIA offered to the KGB to jointly control the development of 'psychotronics' in the United States and the Soviet Union.
- TV program, ZDF, *Geheimes Russland* ,TV-Tagestip, Der Dienstag im ZDF: Dec, 22, 1998, entitled *Secret Russia*. " Since the years of Soviet rule people have spoken furtively in Russia of secret research and experiments, which the Army and the KGB sponsor. ... Rumours are making the rounds, the talk is about victims [of government mind control experiments]. Anatolij Iwanytsch, a 47 year-old former boxer and dissident... His organization has in the meantime grown to about a thousand members from all over Russia.
- *The Moscow Times* July 11, 1995, "Report: Soviets Used Top-Secret ' Psychotronic' Weapons", Owen Matthews. There may be a scientific explanation for the rigid-faced inflexibility of Soviet-era boarder guards and soldiers, after all. Reports have emerged of a top secret program of "psychotronic" brainwashing techniques developed by the KGB and the Ministry. The techniques, which include debilitating high frequency radio waves, hypnotic computer-scrambled sounds and mind-bending electromagnetic fields, as well as an ultrasound gun capable of killing a cat at fifty meters, were originally developed for medical purposes and adapted into weapons, said journalist Yuri Vorobyovsky, who has been investigating the program for three years. Ecology and Living Environment," an environmental and civil liberties group which claims a membership of 500 people in Moscow, has set up an association of "Victims of Psychotronic Experimentation," who have filed damages claims against the Federal Security Service, or FSB, and the government. Unfortunately, since by definition many of the victims are psychologically disturbed, there is a problem of verification. "The Health Ministry and the FSB are doing medical experiments on over a million innocent people," said Ecology and Living Environment President Yemilia Cherkova, an ex-member of Zelenograd's local council. Cherkova wears a lead helmet in bed to protect herself against the rays she says the government beams into her flat. "They put chemicals in the water and use magnets to alter your mind. We are fighting to prove to the authorities that we are not mad." Despite these somewhat far-fetched testimonies, there is strong evidence that some kind of psychotronic warfare program did exist in the Soviet period, and that the technology may be falling into the wrong hands. Official confirmation was first hinted at in the 1991 Soviet budget, which mentioned that 500 million rubles of the state security budget had been spent on "psychological warfare technology" over an unspecified period of years, said Vorobyovsky. Former state security and interior minister General Viktor Barannikov, sacked for supporting the 1993 coup attempt, warned in an Interior Ministry memorandum earlier that year that he had information that the Mafia had got hold of the technology, though little concrete evidence has been found by police. "We have no evidence that our local Mafia has psychotronic weapons; they have enough ordinary ones," said Gennady Melnik of the Moscow Police Department. "They are not the most technologically advanced Mafia in the world. It must be cheaper just to use guns." Nevertheless, the State Duma is taking the matter seriously enough to draft a law on "security of the individual," which will include regulation of subliminal advertising and pseudo-religious sects, as well as imposing state controls on all equipment in private hands which can be used as "psychotronic weaponry." The legislation brings Russia into line with Bulgaria, the only other country to outlaw such equipment specifically. "The law is pre-emptive," said Vladimir Lopatkin, chairman of the drafting committee. "The equipment that now exists in laboratories must be very strictly controlled to prevent it from being sold to the private sector." "One could call this 'Black Science.' Research scientists whose funding has been cut have resorted to putting equipment costing millions of rubles to any use that will pay," said Vorobyovsky. "Of course this project is surrounded with a lot of hysteria and conjecture," said Lopatkin, of the Duma committee. "Something that was secret for so many years is the perfect breeding ground for conspiracy theories."

Gorbachev concerns never reach U.S. mainstream press

- *BBC Summary of World Broadcasts*, 1986, January 21. Press Conference on Gorbachev's Nuclear Arms Elimination Proposals. Tass for abroad. Part1 The USSR; A. International Affairs; 1.General and Western Affairs;SU/8162/A1/1. Lexis-Nexis. "Weapons based on new physical principles would include, amongst others, means in which physical principles which have not been used hitherto are used to strike at personnel, military equipment and objectives. Amongst weapons of this kind one might include beam, radio-wave, infrasonic, geophysical and genetic weapons. In their strike characteristics these types of weapons might be no less dangerous than mass strike weapons. The Soviet Union considers it necessary to establish a ban on the development of arms of this kind."

U.S. wins electromagnetic arms race

- *The Defense News*, Jan.11-17, 1993 article U.S. Explores Russian Mind-Control Technology by Barbara Opall stated, "Known as acoustic psycho-correction, the capability to control minds and alter behavior of civilians and soldiers may soon be shared with U.S. military, medical and political officials, according to U.S. and Russian sources. ...Therefore, the Russian authors have proposed a bilateral Center for Psycho-technologies where U.S. and Russian authorities could monitor and restrict the emerging capabilities."

A serious public issue: control of your mind is a classified military capability

Electromagnetic weapons: concerns and warnings by human rights experts

- *British Medical Journal* Vol. 315, 7-12-97 page 78. Robin M. Coupland, Surgeon, International Committee of the Red Cross stated: "...will the soldiers who have survived battlefields of the future return home with psychosis, epilepsy, and blindness inflicted by weapons designed to do exactly that?"
- Dr. Barbara Hatch Rosenberg wrote in Sept/Oct 1994 *Bulletin of Atomic Scientists*, page 45, "Many of the non-lethal weapons under consideration utilize infrasound or electromagnetic energy (including lasers, microwave, or radio-frequency radiation, or visible light pulsed at brain-wave frequency) for their effects. These weapons are said to cause temporary or permanent blinding, interference with mental processes, modification of behavior and emotional response, seizures, severe pain, dizziness, nausea and diarrhea, or disruption of internal organ functions in various other ways."
- *International Review of the Red Cross* 279, 1, Nov. 1990 entitled The Development of New Antipersonnel Weapons by Louise Doswald-Beck and Gerald C. Caudey. "Research work in this field [electromagnetic weapons] has been carried out in almost all industrialized countries, and especially by the great powers, with a view to using these phenomena for anti-materiel or anti-personnel purposes"
- *Aviation Week & Space Technology*,144(25)1996,June17,Mann,Paul, "Mass Weapons Threat Deepens Worldwide" "A Harvard molecular geneticist and biological/chemical warfare specialist, Matthew S. Meselson warned: 'We're going to learn how to manipulate every life process, genetic ones, mental ones, the emotional ones, ...If our inevitably increasing knowledge of life process is also harnessed to hostile purposes, that will completely change the nature of the expression of human hostility.'"

Allegations of nonconsensual experimentation, illegal foreign and domestic intelligence operations and illegal military use of new weapons of mass destruction

- *World Organization Against Torture*, 1998 report entitled "Torture in the United States", included a section on involuntary human scientific experimentation involving new forms of classified research and testing of high technology military weaponry, including microwave and laser equipment. The report called for a "thorough impartial investigation."
- *The European Parliament Resolution A4-005/99*, Environment, Security and Foreign policy passed on Jan 29, 1999. It included the following: "Calls for international convention introducing a global ban on all developments and deployments of weapons which might enable any form of manipulation of

human beings."

- A preliminary Dr. Bertell Study of medical claims of victims is now underway. Dr. Rosalie Bertell has a doctorate degree in Biometry, the design of epidemiological research and the mathematical analysis of bio-medical problems. She has documented military microwave zapping of Greenham Commons women nuclear protesters in 1980s. See London Guardian, March 10, 1987 page 3, entitled "Peace Women fear electronic zapping at base".
- Dr. Alan Schefflin, law professor at Santa Clara Law School and author of the 1978 Paddington Press book, "Mind Manipulators" and Dr. Colin Ross, psychiatrist appeared on the History Channel, Fall, 2000 on "Mind Control: America's Secret War" (800 708-1776 to order). Both Dr. Schefflin and Dr. Ross commented that it is plausible that electromagnetic and nonlethal weapons on being used in experiments on US citizens without their consent today.
- Please see CAHRA [now Mind Justice] website, mindjustice.org [updated 2-04], for further examples.

Nonconsensual experimentation and electromagnetic weapons, no codification of the Nuremberg Code or penalties under U.S. law. Few laws or treaties to control the use of electromagnetic weapons.

- Ethicist, Jonathan Moreno wrote *Undue Risk Secret State Experiments on Humans*, 1999, W.H. Freeman and Co., a book on radiation and other unethical experiments. Moreno named "...microwave weapons as a source of future illegal experimentation . " Moreno stated; "in the next century, as in the past, military-medical research involving human subjects will be dictated by the limits of information available from other sources."
- Lawyer-ethicist, George Annas, Boston University author of *Nazi Doctors and the Nuremberg Code* that not one of the Nazi doctors on trial at Nuremberg expressed remorse, forgiveness or regret. Eileen Welsome, author of the 1999 book, *The Plutonium Files*, reached the same conclusion about the radiation scientists. They have not admitted guilt, wrongdoing or immoral behavior. It is likely that electromagnetic weapons are being developed by the same cold war mentality today.

Recognizing victims

- *New York Times Magazine*, 8-31-97, page 38, stated; "For decades, those who claimed to be victims of clandestine radiation experiments conducted by the United States government were dismissed as paranoid." Recognition of the growing numbers of worldwide human rights abuse cases is important, especially in light of the fact that electromagnetic weapons target the brain and nervous system.
- *Such Things are Known*, a book by victim Dorothy Burdick, 1981. Burdick was a college professor in a northern California community college. She was targeted with 'microwave hearing, see below, unclassified technology. Author of *Mass Mind Control* and several other self published books, Betsy Russell-Manning, describes several California victims with average backgrounds. Cheryl Welsh, a college student believes she was targeted when she signed papers for entering the military in 1986. She believes she is a baseline study for brain studies on stress, or for military purposes such as psychological operations.
- *Kansas City Pitch Weekly*, April 13-19, 1995, Ex-engineer Against Adverse Energy by Mike Taylor. "He,[Paul Schaefer, engineer] cites numerous examples of occasions when "adverse energies," 'beams' or 'substances' have been 'shot' at him. "A neighbor called me over to her porch one day, to tell me she'd seen a beam of light come out of the sky and shoot into one of my windows," said Schaefer. "I could see the path through the garden where the leaves turned yellow. when asked why they want to attack him, he said it was because of his radical activities and writings."
- Carole Sterling committed suicide in order to escape the torture of electromagnetic technology. Here is an article in *The Star Beacon*, October 1996 page 2 by Carole. " It totally scrambled my brain, leaving me unable to think properly, simply functioning on sheer shock and horror, with total incomprehension of what was going on. It actually was debilitating. The room felt like a torture chamber. This forced me out of my home. I believe that the technology used, be it some type of a frequency assault, some sort of directed energy, in addition to whatever was injected in me, has

caused damage to my brain. [I have] been living with this debilitating and excruciating pain for the last eight months so far."

- *Pennsylvania Inquirer*, 199?, "According to the affidavit, the letter tells Clinton to "tell the Philadelphia Naval Base to stop trying to brainwash me into killing people with covert E.L.F. electronic weaponry and asks for "compensation for being a research test victim."
- *Los Angeles Times*, 3-28-88. Government officials estimate that [Rex] Niles had handed over millions in under-the-table payments to employees of leading contractors in exchange for lucrative subcontracts before he secretly turned government witness and began an undercover campaign with the FBI to sting the crooked buyers who had depended on his largess. Niles' work as an informant led to the conviction of 19 industry buyers and supervisors on fraud, tax evasion and kickback charges, and Niles retired in triumph in April of 1987, lauded for his "unprecedented cooperation," into the Federal Witness Protection Program. But in the way stories have of not ending the way they are supposed to, ... Instead, he is living in a suburban home outside Los Angeles, sleeping under a makeshift foil tent fashioned to block the microwaves he believes are killing him. "His aluminum foil hat has tiny holes in it, says Rex Niles, proof that the government is bombarding him with microwaves in an attempt to kill him. ...He has produced testimony from his sister, a Simi Valley woman who swears that helicopters have repeatedly circled over her home. An engineer measured 250 watts of microwaves in the atmosphere inside Niles' house and found a radioactive disc underneath the dash of his car. ...The noises started again, he said. "you know, in the middle of the night at 2 in the morning, when they wouldn't allow me to sleep; when they were aggravating my conscious as well as my subconscious mind, I would hear what sounded like large groups of people ...that sounded like a bottle breaking in the street. "So I would go to the window, or one time I was dressed because I couldn't sleep, so I went down, and the street was absolutely empty." Niles became convinced that the marshals had set up an elaborate speaker system around his room to confuse him with artificial sounds. In intricate detail, he has worked out his theory of what happened. The marshals, he said, were attempting to make it appear as though he were crazy, setting him up in order to make off with his money. They kept him awake at night to minimize his resistance, he theorized. "...This has been a very tough story to tell people," Niles admitted. They have a hard time believing me and wonder how could I have this much audacity and this much vanity, to think that I'm worth this kind of a push, this much manpower, equipment, airplanes, helicopters, at one point 14 lasers. "It isn't that I'm worth it. It's because they've got so much to protect. ..."
- Featured on 1997 CNN TV program, *American Edge*, a U.S. group, CAHRA [now Mind Justice], now networks with over 500 alleged victims. Other U.S. groups declare thousands are targeted."

Unclassified information supports victim claims

including mind reading, manipulation of emotions and memory, forced dreams and visual hallucinations, microwave hearing, post hypnotic suggestions implanted subliminally and very sophisticated technology such as seeing through the eyes of the victim, as a camera can see.

- *Los Angeles Times*, March 29th 1976 "Mind Reading Machine Tells Secrets of the Brain Sci-Fi Comes True" by Norman Kempster, Washington-In a program out of science fiction, the government is developing mind-reading machines that can show, among other things, whether a person is fatigued, puzzled or daydreaming. Since 1973, a little-known Pentagon agency has been studying ways to plug a computer into an individual's brain waves or electroencephalograph (EEG) signals in the scientist's lexicon. The Advanced Research Projects Agency says the \$1 million-a-year program has passed its initial laboratory tests and is ready for determination of its military uses. Scientist working under agency contracts at the University of Illinois, UCLA, Stanford, Massachusetts Institute of Technology and the University of Rochester and in laboratories other facilities have been able to determine an individual's alertness from his brain waves. They can tell also how he perceives colors and shapes. But there may come a day when the EEG will be used to perform more bizarre tasks. It may be only a matter of time before the machines will be able to read a person's brain waves to determine just what he is thinking. Within two to five years, the Advanced Research Projects Agency hope to test the EEG-computer hookups in a wide range of military uses ranging from pilot training to interpretation of satellite photos of earth. George H. Heilmeyer, director of the research agency, dropped tantalizing hints about the EEG program in his annual report to Congress. Although he has provided few details, enough has been said about the program to raise some questions. For example, could these systems be used to read the minds of prisoners of war or to pick the brains of

unsuspecting American citizens. Highly unlikely, agency scientists say.

- *New York Times Magazine*, Sept 29, 1996, on magnetic therapy. "scientists realized the key was rapidly pulsing the current on and off. ...Here's how it might work: A hand-held computer programs the pattern at which the fields will fluctuate. The impulses move through the temporal lobe and penetrate deep into the brain, where they interfere and interact with the complex electrical patterns of the subject's neural fields. "
- *ABCNEWS.com World News Tonight* with Peter Jennings March 19, 1998 "A Closer Look, Magnetic Therapy for Depression". with Forrest Sawyer, John McKenzie An ABC News transcript described magnetic therapy for depression, "technology that can be used to manipulate people's thought processes, their mood, their memories and possibly even their will, if it is developed sufficiently."
- *CNN news broadcast*, Special Assignment, Nov.-1985, by Chuck DeCaro," Weapons of War, Is there an RF Gap?" This program features Dr. Robert O. Becker, two time Nobel prize nominee, scientist and researcher of electromagnetic radiation effects on the body and author of *Body Electric*, summarized, "The government has never disproved the psychological effects of electromagnetic radiation." Dr. Jose Delgado and his Yale University experiments of brain implants to control a charging bull. Dr. Ross Adey discussed a demonstration of the 1950s Russian lida machine, which used electromagnetic energy to put Russian psychiatric patients to sleep. A demonstration by Dr. Elizabeth Rauscher and Dr. William van Bise, directed magnetic signals into the brain of reporter Chuck DeCaro and created visual images as in a hallucination, and more. For a 55\$ copy of this tape call CNN at 404 827 2712 and ask for R2501 #13, R2747 #33, R2501 #15, R2501-#17. It runs about 20 minutes.
- *Ultrascience*, "Weapons of War", Learning Channel, 1997, Featured Dr. Michael Persinger, Laurentian University. He described weapons using "psycho or influence technology" and electromagnetic radiation frequencies to control what people think, for psychological warfare purposes.
- *Ultrascience*, "War 2020", Beyond Productions, Learning Channel, 1998, Dr. Michael Persinger, Laurentian University demonstrated a helmet with solenoids which induce magnetic fields into the brain and cause panic, fear, God and UFO experiences. He stated that with current technology it is possible to use mind control on the mass populations.
- *Ultrascience III*, Spies are us" Featured Dr. James C. Lin, PhD. biomedical and electrical engineer, educator, author of *Microwave Auditory Effects and Applications*, 1978. Lin demonstrated microwave hearing, a symptom of many of the victims, hearing voices. Also featured Cheryl Welsh on the issue of mind control experimentation.
- *International Defense Review*, 3-1-93, "Special Operations Survives Pentagon budget Constraints", Ramon Lopez. "JASORS, Joint Advanced Special Operations Radio System is being developed by Harris Corporation. ...is a very ambitious, leading-edge technology program, ...Whiles JASORS is a near-term SOF, (Special Operations Forces) enhancement, SORDAC,(Special Operations Research Development and Acquisition Center), is also investigating long-range (1998-2010) and "far-future" (2011 and beyond) weaponry and support equipment. [SORDAC's director, Army Colonel Douglas J.] Richardson said one far-future communications system being investigated is "synthetic telepathy." One day, SOF commandos may be capable of communicating through thought processes."
- Margo Cherney FOIA request for complete NASA abstract Report Number: AD-A090426.,June 1, 1980. Brooks Air Force Base, Jan.25, 2000. The requested information is fully denied under 5 U.S.C. 552(b)(1)..." NASA abstract in part stated, "A decoy and deception concept presently being considered is to remotely create the perception of noise in the heads of personnel by exposing them to low power, pulsed microwave. When people are illuminated with properly modulated low power microwaves the sensation is reported as a buzzing, clicking, or hissing which seems to originate (regardless of the person's position in the field) within or just behind the head. The phenomena occurs at average power densities as low as microwatts per square centimeter with carrier frequencies from 0.4 to 3.0 GHz. By proper choice of pulse characteristics, intelligible speech may be created. Before this technique may be extended and used for military applications, an understanding of the basic principles must be developed. Such an understanding is not only required to optimize the

use of the concept for camouflage, decoy and deception operations but is required to properly assess safety factors of such microwave exposure."

- *Microwave News*, editor, Louis Slesin, Jan/Feb 1997 p 14. "U.S. Air Force Looks to the Battlefields of the Future: Electromagnetic Fields That Might "Boggle the Mind" "It would also appear possible to create high fidelity speech in the human body, raising the possibility of covert suggestion and psychological direction. When a high power microwave pulse in the GHz range strikes the human body, a very small temperature perturbation occurs. This is associated with a sudden expansion of the slightly heated tissue. This expansion is fast enough to produce an acoustic wave. If a pulse stream is used, it should be possible to create an internal acoustic field in the 5-15 kHz range, which is audible. Thus it may be possible to "talk" to selected adversaries in a fashion that would be most disturbing to them."
- *Federal Times*, Dec. 13, 1976 "Microwave Weapons Study by Soviets Cited." The Defense Intelligence Agency has released a report on heavy Communist research on microwaves, including their use as weapons. Microwaves are used in radar, television and microwave ovens. They can cause disorientation and possibly heart attacks in humans. Another biological effect with possible anti-personnel uses is "microwave hearing." "Sounds and possibly even words which appear to be originating intracranially (within the head) can be induced by signal modulation at very low average power densities," the report said. According to the study, Communist work in this area "has great potential for development into a system for disorienting or disrupting the behavior patterns of military or diplomatic personnel." No mention was made of the still-unexplained microwave bombardment of the American Embassy in Moscow. The study dealt largely with long-term exposure of days or weeks in industrial situations, which usually produce mild effects. Short exposure to intense radiation can cause heart seizure and a wide range of physical disorders.
- CIA FOIA search for documents on 'Auditory' listed the following document."F80-0547, 1974-12-02 untitled (Discusses A Highlight of the Conference on Auditory or Noise-In-The-Head Effect)
- *BBC News Online* Oct 11, 1999, "Looking Through Cats' Eyes Fuzzy But Recognizable", Dr. David Whitehouse, http://news.bbc.co.uk/1/hi/english/sci/tech/newsid_471000/471786.stm A BBC News article reported on the first pictures from an experiment to see through the eyes of a cat.

A serious public concern: Control of your mind is a classified military capability

- Excerpts from CAHRA [now Mind Justice] website military journals and government document quotes: "...to control the will and perception of adversaries ...by applying a regime of shock and awe...It is about effecting behavior." "A decoy and deception concept [using microwaves] to "create intelligible speech ' in the head, 'raising the possibility of covert suggestion and psychological direction." "tools that could...make potential enemies see, hear and believe things that don't exist." "...crowd control and urban warfare devices that temporarily could paralyze an entire village."

Conclusions

- The Soviet government's admission to mind control programs comparable to the atomic bomb and to a lesser extent, the US government's admission, became public knowledge because of the break up of the Soviet Union. In addition, the US government declassified some of their 40 year old classified emr nonlethal weapons and began to promote them to the public. This information coupled with the fifty year history of the East/West scientific dispute over nonthermal bioeffects is evidence of an East/West mind control arms race. The US and Russian governments admit that mind control technology is classified. The Russian and US victims of illegal mind control programs have clear proof of government involvement and motive. The growing and already massive program of alleged, illegal experimentation and the use of mind control on the unsuspecting public is a serious human rights issue in need of a thorough and impartial investigation.

For further documentation on this serious and extensive issue, refer to CAHRA [now [Mind Justice](http://mindjustice.org) mindjustice.org] website.

Four Prominent Experts Weigh In on the 2005 Government Mind Control Debate

[Mind Justice Home Page](#)

by Cheryl Welsh, director, Mind Justice, June, 2005, with special thanks to Harlan Girard, director of International Committee Against Offensive Microwave Weapons and world class researcher and the numerous victims who generously shared their research information.

All can agree that mind control weapons are classified but how advanced are they? Is mind control just science fiction and a conspiracy theory or the next weapon of mass destruction and one of the deepest secrets of the nation? How would we find out if the U.S. government did have mind control weapons? Four experts provide surprising and intriguing answers that challenge widely-held assumptions.

- Gloria Naylor, author of 2005 book, *1996*, available July on [amazon.com](#), 1983 National Book Award winner for Best First Fiction for *Women of Brewster Place*, author of numerous books, graduate of Yale University. Naylor has been distinguished with numerous honors including; Senior Fellow, The Society for the Humanities, Cornell University. Naylor is the recipient of Guggenheim and National Endowment for the Arts fellowships for her novel
- Jon Ronson, 2005 New York Times reviewed author, journalist
- William Arkin, 2005 New York Review of Books reviewed author, NBC News military analyst, former army intelligence officer, former Los Angeles Times columnist, secrecy expert
- Richard Garwin, Council on Foreign Relations nonlethal weapons report co-author, 2003 winner of the National Medal of Science, the nation's highest honor for the fields of science and engineering.

Introduction and Background Information on the Mind Control Debate

To clarify the complex issue of government mind control, four prominent experts share their 2005 comments on government mind control and are quoted here and in detail below. For further citations and information please see Mind Justice at www.mindjustice.org.

Initial Comments By:

Gloria Naylor

Vanessa Bush of the American Library Association, wrote an editorial review of Gloria Naylor's 2005 book, 1996, and concluded;

...The intensely private Naylor found herself in the company of other prominent black writers and activists targeted by the government. She includes addenda with research and litigation regarding government experiments with mind control. ...her incredible book will spark debate about government surveillance and the blurring of the lines between fiction and nonfiction.

Gloria Naylor offers a professional voice to victim's claims that the government is targeting them and testing new classified remote mind control weapons. Naylor risked her reputation and publicly addressed a scorned, ridiculed and troubling subject when neuroscientists, human rights experts, government representatives and almost everyone else completely shun the issue.

Jon Ronson

Jon Ronson's book, the 2005 New York Times reviewed book, *Men Who Stare at Goats* is an entertaining yet unsettling examination of the serious issues in the mind control debate. Ronson interviewed military experts who say there are no advanced mind control weapons, just claims of nonsense and science fiction. Ronson guardedly says mind control weapons are possible, given that mind control patents have been bought up by the government. Ronson reports on allegations of mind control experiments by Guantanamo detainees and Iraqi prisoners of war and concludes we don't know whether advanced mind control weapons really work and mind control research is classified.

William M. Arkin

William M. Arkin, author of the 2005 book *Code Names Deciphering U.S. Military Plans, Programs, and Operations in the 9/11 World* described government scandals in light of the 2005 world of government secrecy. Steven Aftergood of *Secrecy News*, [Federation of American Scientists](#) commented that *Code Names* was "perhaps the most concentrated act of defiance of official secrecy policies since Howard Morland wrote about the H Bomb Secret in the *Progressive* in 1979."

Arkin wrote; "As I have learned in compiling this directory, most genuine secrets ironically remain secret. ...Yet Abu Ghraib is like every other national security surprise: We cannot know who the players are or what they are up to until after disaster strikes." Arkin listed disasters including "...domestic spying operations, illegal weapons developments, and human experimentation". Some nonlethal weapons like blinding lasers were classified at some of the highest levels of secrecy only because the weapons are repugnant. Arkin reported that all can agree there is a lack of effective oversight, particularly in Congress.

Richard Garwin

Richard Garwin is co-author of the 1999 Council on Foreign Relations, (CFR) report entitled, *Non-Lethal Technologies: Progress and Prospects*. While nonlethal weapons became better known to the public in the 1990s, Garwin reported there were already developed and highly classified "large programs" in "psychological warfare, information warfare, and nonlethal weapons with strategic potential".

Garwin co-authored the subsequent 2004 Council on Foreign Relations report, *Nonlethal Weapons and Capabilities* which described the ongoing interservice conflicts, the problem of redundancy, a burdensome secrecy system and the lack of accountability for weapons.

Garwin's views are more critical of nonlethal weapons and more informative than most but are representative of the government position on mind control weapons. Garwin kindly replied to email questions in January, 2005 and said he has evaluated electromagnetic weapons for the Defense Department several times but "there are always 'compartments' to which even people with high-level security clearances do not have access." Garwin concluded, "...In my analyses of the effect of radiowaves on people, I have never found any significant effect other than

heating of the tissues. ...So I don't think there is much in the threat of electromagnetic signals to control or disorient people by the effect on the human brain."

[Contents](#) | [Top](#)

The Debate So Far

The debate today focuses on how advanced mind control weapons are. Ronson, Arkin and Garwin agree that because of national security, not even the government experts with high-level security know what is classified with certainty. But most government experts and scientists still say it is unlikely there are advanced mind control weapons today. The government's bully pulpit, with government control of all mind control weapons and research information including cover stories, has created an extremely one sided debate.

For years, the mind control nut case and conspiracy theory appeared to be a common sense explanation for people who claimed the government was targeting them with frequencies and new technologies. While some are mentally ill, some claims are not. As in the national security experiments which took place in conjunction with the development of the atomic bomb, radiation experiment victims were labeled "the crazies" by the Department of Energy officials, according to the The August 31, 1997, New York Times Magazine article, *Atomic Guinea Pigs*.

In 1993, U.S. Secretary of Energy Hazel O'Leary declassified government documents proving illegal government human radiation experiments and yet no one was punished for conducting the illegal human experiments.

Fair or not, the unanimous position of the press and public today is that mind control is a conspiracy theory so why investigate further? The stigma and biases of mental illness and conspiracy label hide the serious issues underneath. For example, after the scandal of human radiation experiments, proposed changes in human experimentation rules were never implemented.

As a democracy, do we want to allow another scandal of illegal national security human experiments?

What has been muted for years by the conspiracy theory label is the growing circumstantial evidence of government mind control weapons. Below, Ronson, Arkin and Garwin's comments add depth and credibility to an issue with great significance for the public if not now, in the future. But first, background information is necessary for any meaningful understanding of the issue.

The Government's Position: There is no government mind control. Government mind control cover stories; mind control is science fiction, russian mind control weapons do not work, mind control is nonsense and a conspiracy theory by nut cases

The government's position on mind control is questionable and not to be trusted because if mind control is a classified weapon, the government would use a cover story to conceal its existence. As cited below, highly classified mind control programs already exist, mind control weapons are considered more powerful than the atomic bomb and the russians are rumored to have mind control weapons. Accordingly, the government's position that they have no mind control weapons is probably a cover story. Steve Aftergood, a highly regarded secrecy expert explains excessive government cover stories. In the Bulletin of Atomic Scientist article entitled, *The Soft-Kill Fallacy*, September/October, 1994, he wrote;

The government secrecy system as a whole is among the most poisonous legacies of the Cold War. ...the Cold war secrecy system also mandates active deception. ...A security manual for special access programs [SAPs] authorizes contractors to employ 'cover stories' to disguise their activities. The only condition is that 'cover stories must be believable'. Even the government is starting to recognize that official cover and deception programs are getting out of hand and need to be curtailed.

The prevailing official government comments on mind control weapons are that they don't work, are science fiction or a conspiracy theory claim by nut cases. Below is a typical response;

Defense News, December 17-23 2001, *Israel Fields Means to Suppress Palestinian Violence*
by Louise Doswald-Beck;

...In a Dec. 9 interview marking the close of his four-year term at the helm of Israel's formidable defense research and development sector, Ben-Israel, [Major General Isaac Ben-Israel] said his directorate explored different scientific and phenomenological fields-including mind control- in attempts to contain and deter terrorist activity. "We invested in this for a few years...but we determined that it was not effective," Ben-Israel said of mind control methods, many of which were developed by military and security agencies of the former Soviet Union.

Everyone can agree that if government mind control was an effective weapon, officials would never admit it. Since the break up of the Soviet Union, information on russian mind control became available although as in the U.S., no government documents or proof of mind control weapons other than circumstantial evidence were ever publicly confirmed.

The Scientist's Position: Advanced mind control is still science fiction

Most scientists accept the prediction of a matter of years or decades before scientists will understand how the brain works. In the October, 2004 Discover Magazine article entitled, *Mind Control* by John Horgan, Defense Advanced Research Projects [DARPA] scientist John Chapin stated, "The neural code [is] right up there with two other great scientific mysteries: the origin of the universe and of life on earth. The neural code is arguably the most consequential of the three. ...the neural code may be the hardest to solve." Horgan interviewed several eminent neuroscientists and most agreed advanced mind control was not a concern now because it would take decades to develop. There was no agreement on any one theory for decoding the brain.

Most scientists agree that advanced mind control weapons would be scientifically possible and practically inevitable as a result of solving the mysteries of the brain. Gregg Herken, Smithsonian curator is representative of the numerous comments about the ultimate power and impact of future government mind control weapons. Herken reviewed a book about the supersecret U.S. NRO or National Reconnaissance Office, an intelligence directorate for satellites. In the Boston Globe, April 6, 2003, book review of *Secret Empire* by Philip Taubman [Washington Post editor], Herken wrote;

...Despite the faults and failures that Taubman cites, it is difficult to imagine how the United States will become less reliant upon its eyes-and ears-in-the-sky. Instead, The NRO's wizards in Chantilly, VA., are no doubt looking forward to the day when they will have the ultimate in technical collection capability: a satellite that can see into the mind of the likes of Saddam Hussein or Osama bin Laden.

Most experts agree that no advanced mind control weapon is possible based on the current level of scientific capabilities. Most people dismiss mind control claims for this reason. The scientific capability to read a persons thoughts, implant thoughts, control memories, actions or dreams is not available in the open neuroscience literature.

The Victim's Position: Advanced mind control weapons are developed and highly classified but the government will never tell you

Most people are unaware that the debate on predictions and suppositions begins and immediately disappears into the black hole of classified neuroscience and mind control research. This fact is rarely reported in mainstream press.

Here is a brief counterargument which challenges the current public perception of neuroscience research. Of course neither the government nor the victims can win this point without further declassified government documents or scientific proof.

First, the government does not publicize the fact that the military has large classified programs for neuroweapons and that many neuroscientists are conducting classified research. See

<http://www.mindjustice.org/2005update.htm> for further citations. And for many reasons, most neuroscientists dislike discussing mind control seriously, making it extremely difficult for the public to get reliable information on this issue.

The Victim's Position: Most neuroscientists shun discussions of advanced mind control, resulting in unreliable and hard to find mind control research information for the public

Here is one example. In an interview, Dr. Kovacs, assistant professor at the Stanford University Center for Integrated Systems explained how the National Institutes Of Health (NIH) refused to discuss their neural implant research. As reported by Larry Lange, Electronic Engineering Times, February 10, 1997, *Treading fine line between man and machine, researchers pursue silicon prostheses -- Chip implants: weird science with a noble purpose*;

...NIH is mum

While Kovacs discussed the NIH's work openly, that federal agency isn't talking. EE Times was refused an interview with Terry Hambrecht, longtime head of the Neural Prosthesis program at the NIH, and a request for in-depth background material on NIH's work with neural implants was denied.

...

Much of the work taking place at the NIH, Stanford and elsewhere is built on research done in the 1950s, notably that of Yale physiologist Jose Delgado, who implanted electrodes in animal brains and attached them to a "stimoeiver" under the skull. This device transmitted radio signals through the electrodes in a technique called electronic stimulation of the brain, or ESB, and culminated in a now-legendary photograph, in the early 1960s, of Delgado controlling a live bull with an electronic monitor.

It's understandable, in a way, why NIH prefers not to broadcast its work on implants. Often, press reports about research of this nature set off an uproar—sometimes enough to intimidate researchers, rouse irate Congressmen, spark "Frankenstein" editorials and jeopardize funding.

Mad scientists?

...

Stanford's Kovacs agrees: "Real scientists have not done a good job of explaining this complicated work to the lay population," he said, especially the research in brain implants, which may strike the general public as a little too close to The Manchurian Candidate.

What happens when scientists publicly discuss mind control? Law professor Alan W. Schefflin co-authored the 1978 book, *The Mind Manipulators*. On page 344, Schefflin wrote about Dr. Delgado, the Yale physiologist mentioned above;

Shortly after publishing his [Delgado's] proposals to make brain research a national priority, he lost his funding from the National Institutes of Health. He places the blame on the fear that ESB "could introduce the nightmare of mass control of man, overriding and overpowering individual self-determination." At the same time, Delgado came under considerable criticism at Yale and left the United States to become chairman of the medical school at the Autonomous University of Madrid.

Schefflin reported on page 339; "Much of Delgado's research support has come from the Office of Naval Research and the U.S. Air Force. According to a report sponsored by the Air Force, interest in ESB by U.S. military authorities dates back at least to the Korean War, when it was seen as a potential threat to prisoners of war."

As the EE Times article and Schefflin's quote illustrate, most people don't realize mind control is an extremely controversial issue and many neuroscientists are involved in military and classified research. As a result, neuroscientists don't want to talk about mind control and the

public is unable to determine how advanced mind control research really is.

The Victim's Position: A rare find; a prominent physicist's scientific theory for advanced mind control

The publication of mind control theories by scientists is rare, as reported in the EE Times article. The renown physicist Freeman Dyson, who has conducted classified research, described a general mind control scientific theory for decades into the future. Dyson commented; "After the organization of the central nervous system has been explored and understood, the way will be open to develop and use the technology of electromagnetic brain signals." Quote from International Herald Tribune, April 25, 1997, *Book Review, Imagined Worlds*, by Rudy Rucker.

Dyson described his mind control theory in 1997 book, *Imagined Worlds*;

...The chief barrier to progress in neurophysiology is the lack of observational tools. To understand in depth what is going on in the brain, we need tools that can fit inside or between the neurons and transmit reports of neural events to receivers outside. ...observing instruments...with rapid response, high band-width and high spacial resolution... There is no law of physics that declares that such an observational tool to be impossible.

We know that high-frequency electromagnetic signals can be propagated through brain tissue for distances of the order of centimeters. We know that microscopic generators and receivers of electromagnetic radiation are possible.

We know that modern digital data-handling technology is capable of recording and analyzing the signals emerging from millions of tiny transmitters simultaneously. All that is lacking in order to transform these possibilities into an effective observational tool is the neurological equivalent of integrated-circuit technology. We need a technology that allows us to build and deploy large arrays of small transmitters inside a living brain, just as integrated-circuit technology allows us to build large arrays of small transistors on a chip of silicon.

...Radioneurology is in principle only an extension of the existing technology of magnetic resonance imaging, which also used radio-frequency magnetic fields to observe neural structures. A rough estimate based on the available band-width indicates that a million transmitters could be monitored through each patch of brain surface with size equal to the radio wave-length.

Dyson's theory seems to contradicts Garwin's statement, "...In my analyses of the effect of radiowaves on people, I have never found any significant effect other than heating of the tissues. ...So I don't think there is much in the threat of electromagnetic signals to control or disorient people by the effect on the human brain." Deciphering what expert is right about the sparce and complex mind control information available to the public will be a challenge.

Victim's Position: Supersecret CIA mind control research continues

One of the most influential U.S. scientists, Dr. Edwin Land, known for his highly successful but classified work on satellite cameras also conducted 1960s and 1970s CIA mind control research. Dr. Land was a presidential science advisor who served on many national security related boards and committees.

The CIA's infamous mind control programs and experiments were revealed in 1970s congressional hearings. Classified mind control research took place in over eighty institutions, such as UCLA, MIT, Stanford and Harvard. A 1979 Washington Post article reported that classified mind control research continued under the direction of Dr. Land. *Book Disputes CIA Chief on Mind-Control Efforts: Work went on Into 1970s, Author Says*, January 29, 1979, Washington Post;

Despite assurances last year from Central Intelligence Director Stansfield Turner that the CIA's mind-control program was phased out over a decade ago, the intelligence agency has come up with new documents indicating that the work went on into the 1970s, according to a new book. John Marks, the author of the book, said the CIA mind-control researchers did apparently drop their much publicized MK-ULTRA drug-testing program. But they replaced it, according to Marks, with another supersecret behavioral-control project under the agency's Office of Research and Development.

The ORD program used a cover organization set up in the 1960s outside Boston headed by Dr. Edwin Land, the founder of Polaroid, who acted as a "figurehead," said Marks in his book. The project investigated such research as genetic engineering, development of new strains of bacteria, and mind control. The book identifies the Massachusetts proprietary organization headed by Land as the Scientific Engineering Institute. The CIA-funded institute was originally set up as a radar and technical research company in the 1950s and shifted over to mind-control experiments in the 1960s with the exception of a few scattered programs. According to Marks, however, the ORD program was a full-scale one and just as secret as the earlier MK-ULTRA project. ...

Clearly, the government position based on national security concerns is that mind control should remain one of the deepest secrets of the nation. This critical fact is not explored or mentioned in the Discover Magazine article or mainstream press. The public must sort through the mind control debate with unreliable information and without critical facts.

Victim's Position: The U.S. government is capable of widescale, long-term, inhumane treatment by trusted officials; compare to the Catholic church sex abuse scandal and the tobacco industry denial of addiction to tobacco and tobacco-related deaths

This has been another convincing argument to most people for dismissing claims of advanced mind control. Since the 1960s, victims have consistently reported a pattern of symptoms including remote targeting and mind control weapons capable of reading thoughts, implanting thoughts, seeing through the victim's eyes, turning pain on and off like a faucet in any part of the body, manipulating dreams, memories and more.

On it's face, it is hard to believe that the U.S. government could do such a cruel, horrific crime as mind control targeting on so many victims for so long and keep it secret. But two recent analogies clearly illustrate it is possible, even likely.

The 2002 scandal involving Catholic church priests sexually molesting young boys is analogous to mind control experiments and is a compelling case of how terrible acts can be kept secret for years by a great and trusted organization. Many top Catholic officials kept the sexual molestations secret for years. See December 31, 2002, Los Angeles Times, *Molestation scandal Wrenched Church Hierarchy and Faithful*.

The sexual molestations took place for decades, on a large scale and were called "the greatest scandal in the history of the American Catholic Church". The molestations were not known by the public because the policy of the Catholic church was to ignore the problem. Surrounded by the denials of Catholic officials, the charges were unbelievable, horrific and extremely difficult to prove. Finally, widespread media coverage forced the very reluctant church in Rome to address the scandal.

The disclosure of the tobacco industry's decades-long knowledge of the health risks of smoking and it's addictive nature is also analogous to mind control experiments. Officials at the highest levels condoned and contributed to the tobacco deaths of smokers while at the same time, making billions of dollars for over half a century. In 1994, top officials lied under oath to Congress stating they didn't believe cigarettes were addictive or caused cancer. Tobacco company documents contradicted their testimony.

In the information age, inhumane, even horrific acts and the complicity of the many silent bystanders does occur. Mind control experiments could happen today.

These are the main points including rarely reported facts which represent the victim's position generally, on the government mind control debate. The victim's position does not include the government documents or solid evidence that most everyone requires before they are able believe advanced mind control exists but is enough to warrant further investigation.

[Contents](#) | [Top](#)

Deeper Issues Underlying the Government Mind Control Debate

Whether victim allegations are believable or not, mind control weapons are worth discussing further.

The main concern is the lack of the right to debate new weapons of mass destruction because they are classified until deployed. The atomic bomb was public information almost from the start. Nuclear protesters and the general public could express their views on the atomic bomb. International arms control treaties are in place.

Mind control and electromagnetic weapons have been heavily classified for over forty years and never publicly used. The classified electromagnetic weapons are completely lacking in any evaluation by human rights groups for international treaty compliance and lack any public input or scrutiny.

While scientists don't agree on whether advanced mind control weapons have been developed, no one disputes that advanced mind control weapons are likely to remain secret with little if any accountability to the public.

Below, Ronson, Arkin and Garwin examine national security and mind control weapons for an informative and relevant debate.

[Contents](#) | [Top](#)

Detailed Comments by Jon Ronson: A Repeating Pattern of New Classified Weapons and Dismissed Allegations

Jon Ronson presents a fresh look at mind control weapons in an entertaining yet disturbing nonfiction account. Here are excerpts from the New York Times review of Ronson's book, followed by excerpts from his book and Ronson's Cspan book talk in April, 2005. Finally, excerpts of a 1991 Guardian news article excerpts are included for comparison.

Excerpts from the New York Times, April 7, 2005, *True Tales Odd Enough to Stop a Farm Animal's Heart*;

At the start of the twisted treasure hunt that is *The Men Who Stare at Goats*, the journalist Jon Ronson appears to be looking for furtive, paranoid quacks who play mind games. He seems to have hit the mother lode.

...And Mr. Ronson addresses the more sinister aspect of out-of-the-box military thinking.

The Men Who Stare at Goats turns into a book that connects dots. It sees a common thread in the use of screamingly bad music to assault Gen. Manuel Antonio Noriega in Panama and the use of similar tactics in the destruction of the Branch Davidian compound in Waco, Tex. In these accounts, Mr. Ronson writes as much about schemes that were only contemplated as about the ones that actually made the cut.

For instance, he describes the effort to deploy a Moscow scientist who had previously sent subliminal messages to Red Army troops ("Do not get drunk before battle") in the Branch Davidian standoff. This scientist didn't work out because he was unwilling to transmit words

spoken by Charlton Heston as a bogus voice of God.

Mr. Ronson, a filmmaker and journalist whose earlier book, *Them: Adventures With Extremists*, was also outstandingly artful and chilling, eventually follows his trail of bread crumbs to the realms that really matter. He finds a prologue in MK-ULTRA, the real C.I.A. "Manchurian Candidate" research of the 1950's, which involved the disastrous use of LSD as a potential truth serum.

He follows this line of thinking through and beyond the fruitcake innovations of the 1970's, concluding that Colonel Channon's theories "could be used to shatter people rather than heal them." "Those are the ideas that live on in the War on Terror," he adds.

Inevitably, this account extends to the tactics of American guards at the Abu Ghraib prison in Iraq. And somehow Mr. Ronson is able to keep his book both light and nightmarish. ...

Excerpt From Ronson's Book, page 53

Colonel Alexander has been a special advisor to the Pentagon, the CIA, the Los Alamos National Laboratory, and NATO. He is also one of Al Gore's oldest friends. He is not completely retired from the military. A week after I met him, he flew to Afghanistan for four months to act as a "special advisor." When I asked him who he was advising and on what, he wouldn't tell me."

On page 200, Ronson wrote; "Colonel Alexander has spent a lifetime in the world of plausible deniability and I think he's got to the stage where he just trots these things out." Page 201 continues with a question to Col. Alexander about frequencies and psycho-correction devices and Alexander replies, "This is not something that has been brought up or addressed, and we have covered the waterfront of nonlethal technologies," he said. "We are not warping people's brains or monitoring people or da da da da da. It's just nonsense."

Ronson interviewed Kenneth Roth, director of Human Rights Watch regarding the loud music like Barney the purple dinosaur song used on prisoners of war in Iraq, page 144-5;

"I have small kids. I can understand being driven crazy by the Barney theme song. ...And I wonder what else is going on in those shipping containers while the music is being played! Perhaps the prisoners are being kicked around. Perhaps they're naked with a bag on their head. Perhaps they're chained and hanging upside down" But the journalists rarely, if ever included those possibilities in their stories. ...He [Kenneth Roth] didn't know what was going on. That, he said was the problem.

Excerpts of Cspan Video Clip of Ronson

April 14, 2005, Politics and Prose book store in Washington DC. Available from Cspan, Book TV at www.booktv.org. Videotape # 186334, about 36.00\$ See five minute video clip [here](#):

...But what you see is all these nonlethal technologies. You see all these kind of nutty ideologies. All battling for supremacy like a kind of casserole of ideas - outside the church of Waco. And from the former detainees from Guantanamo Bay that I've interviewed it seems exactly the same things are going on there. I said to a man called Jamal al-Harith how do you feel, you know how did you feel at Guantanamo Bay and he said "I felt like a laboratory rat." And he said, "I felt they were trying stuff out on me."

And we know that the history of the army- in this room is Eric Olson whose father was victim to two of these think-tank ideas- one known as MK-ULTRA, [with LSD used on unsuspecting victims] ...and another think-tank program called Artichoke, [involving the injection of heroin]...

...And one example is with Barney the purple dinosaur. When it was announced a year ago that they were rounding up prisoners of war in Iraq and blasting them

with Barney the purple dinosaur, it was treated as a funny story, because, by all the major news networks in America, you know... the torture wasn't that bad. ...It was disseminated as funny because who wants to replace a funny story with, as Eric [Olson] once said to me, with one that's not fun.

...I was given seven photographs of a detainee who had just been given the Barney treatment as they called it. It was 48 hours of Barney with flashing strobe lights inside a shipping container in the desert heat. I mean this was the funny story of the war. [Ronson reads from his book] OK, So this is the description with the photograph of the man who had just been given the Barney Treatment... But I can say this. In the last photograph he is screaming so hard it almost looks as if he is laughing.

...The current chief of staff of the Army is a man called General Pete Shoemaker. ...He's well known to have an interest in these paranormal esoteric military pursuits. ...So now is the time when I know that these ideas go to the very top [levels of the military].

...One of the things you spoke of, the one that I have knowledge of is the frequencies. You can follow a trail of patents like footprints in the snow and the patents sometimes vanish into the world of military classification. And there's many patents bought up by a man called Dr. Oliver Lowry. ... So we know that these patents have been bought up by the military. ...And the detainees of Guantanamo I've spoken to speak of being blasted with frequencies, put inside music, high and low frequencies, masked with music.

...I think there's no doubt they're experimenting with this stuff. To add to that controversial suggestion. I think there's a good chance that even though they're trying this stuff out, it's not necessarily true that it works. A lot of this stuff doesn't work. This may or may not work. I don't know.

Ronson explained "how history seemed to show that whenever there is a time of a great American crisis- the War on Terror, the trauma of Vietnam and its aftermath, the Cold War-its military intelligence is drawn to the idea of thought control." He explained Colonel John Alexander's ideas that over millennia, prisoners caught in a war that never ends were killed or put into slavery, which is not possible today. To Alexander the alternative is to change their minds. Do we want the Defense Department to be able to implement similar ideas without public input? Ronson's book offers proof that this may be happening.

A Brief Comparison of the Gulf War and Iraqi War

The 1991 Guardian article is included here to show that the events in Ronson's book are not new, but part of the continuing development of highly classified weapons that target the brain and nervous system and the repeating pattern of dismissing victim allegations as nut cases.

The London Guardian, February 2, 1991, *War in the desert (Electronic Weapons)*

Field of nightmares - Magnetic energy you can neither smell, nor see sounds like the basis for the ultimate weapon.

Simon North looks at the electronic armoury being developed that can disorientate, stun or kill, and leaves no hiding place. Is it sufficiently advanced to be used in the Gulf?

... Or will the Gulf War prompt the first use of anti-personnel electronic weapons? Their development, both in the US and the USSR, has been shrouded in secrecy.

Tyler [Captain Paul Tyler of the US Navy] proposed the EM systems could be used to 'produce mild to severe physiological disruption or perceptual distortion or disorientation'.

...The story now moves to England. In the spring of 1985, shortly after Cruise

missiles had been deployed, the women protesters at Greenham Common began to notice unusual physical effects. The symptoms included headache, earache, nosebleed, nausea, vertigo, fatigue, changes in menstrual cycle, and emotional symptoms such as depression, confusion and paranoia. The woman found that the acute symptoms occurred at particular times and specific locations around the camp.

These symptoms correspond to microwave poisoning, about which at the time the women knew nothing. One of the women, Kim Besly, connected the symptoms with the unpleasant effects of radar she had come across during the war. Over the years Besly and other women have documented the Greenham effects, and made contact with experts in the field, including Robert Becker.

Becker has written: "I have not examined any of these people, all I have done is determine their exposure, sequence of events and symptoms from telephone conversations or letters ...(These)people certainly fit well inside the electromagnetic field exposure syndrome as far as I have been able to characterize it."

He has told the Guardian that in his view there is a distinct possibility that anti-personnel devices may have been used against the Greenham Common protesters. "This is a more probable explanation than the alternative that these were hysterical responses."

There is little doubt that crowd control devices using Radio Frequency Radiation do exist. The development of such devices would complement Sonic and Infra-red weapons, which are well known, and were advertised in the British Defence Equipment Catalogue until 1983.

...In 1984 the Ministry of Defence ordered that all advertisements and references to 'frequency weapons' be cut from the Defence Catalogue.

...One thing is certain, the war in the Middle East will accelerate the development of a new kind of weapon the world could do without.

The 1991 Guardian article described highly classified electromagnetic weapons in Russia and the U.S. Nuclear protesters claimed they were targeted with new weapons and for the most part, were dismissed as hysterical nut cases. The pattern of victim's claims of weapons targeting being dismissed and not investigated further is repeating in the Iraqi war, as reported in Ronson's book. In addition, Ronson discussed classified patents and claims of targeting with advanced frequency weapons which directly targeted the mind.

Detailed Comments by William M. Arkin:

A vastly changing government secrecy system without public input. What happens to democracy?

William Arkin's 2005 book *Code Names* is a succinct and impressive account of the post 9-11 system of U.S. government secrecy. The New York Review of Books, May 26th, 2005 stated; "Arkin believes that the classification system has developed a momentum of its own, uncoupled from the legitimate demands of operational secrecy, and become a life support system for policies and activities-like the invasion of Iraq- which would not hold up under the light of public or congressional scrutiny."

Seymour Hersh, the well-known investigative reporter wrote; "William Arkin makes amateurs of all of us who think we know something about America's constantly expanding hidden world. *Code Names* is quite simply a stunning array of secrets and super-secrets that Arkin has put together in a way that makes it easy for any citizen to comprehend..."

In the mid 1990s, as a student majoring in government at California State University, Sacramento, I

networked with William Arkin, then a Human Rights Watch Arms Project analyst. I sent Arkin several russian newspaper articles on mind control and the proposed russian legislation to ban russian mind control weapons which became available as a result of the breakup of the Soviet Union. Arkin reviewed the information and advised me to find government documents or solid scientific evidence before a group such as Human Rights Watch could take on the issue of mind control weapons and illegal government experiments.

Arkin's book excerpts and Democracy Now interview excerpts below provide a reliable explanation for how mind control weapons would be classified

Page 13;

As I have learned in compiling this directory, most genuine secrets ironically remain secret. Enormous segments of the activities of the military and Intelligence Community remain safely under wraps and represent an even more staggeringly complex secret world.

Page 14;

Yet Abu Ghraib is like every other national security surprise: We cannot know who the players are or what they are up to until after disaster strikes." [Arkin lists disasters including] "...domestic spying operations, illegal weapons developments, and human experimentation".

Arkin's book corroborates the 1991 Guardian article and Ronson's book. Page 13;

...Beyond the ridiculous, though, there is a rapidly growing army of secret "special mission units" that are beyond scrutiny and increasingly a law unto themselves. SAPs, moreover, include a fair share of weapons and capabilities that are secret only because they might be perceived as repugnant (high-powered microwaves or blinding lasers), illegal (domestic programs that obscure the lines restricting what the military and Intelligence Community can do inside the United States), or downright dangerous (capabilities being developed to go beyond nuclear weapons in cyber-warfare and directed-energy weaponry to nullify enemy weapons- perfectly logical on the one hand, but potentially destabilizing if Russia or some other nuclear power ever perceived that they were part of a "first strike" program).

Amy Goodman, Democracy Now 2005 Interview William Arkin

Thursday, January 27th, 2005. More information available at codenames.org. Complete interview at democracynow.org.

...We speak with military analyst, William Arkin, author of the new book *Code Names: Deciphering U.S. Military Plans, Programs, and Operations in the 9/11 World*. ...I began by asking him why he published the book.

WILLIAM ARKIN: Well, I'm in a position as a journalist and a military expert to collect a lot of this information. I guess it has been a passion of mine to follow the secret and not-so-secret meanderings of the military over the years.

It seemed to me that there was an incredible explosion of secrecy after 9/11, and I guess I just felt compelled to do what it is that I was asking the government to do, which is to put it out there. I felt like if I had hoarded that information or kept it for my own use, then I would be no better than what I'm criticizing the government for doing.

And I also believe that, you know, there are secrets and there are secrets, and merely because the government stamps something classified or claims that it is secret doesn't make it so. And I wanted to challenge the trivial secrecy because it seemed to me that was also the area where we got into the most trouble.

Scandal follows secrecy like night follows day. And to me, I felt compelled, both as a citizen and then as an expert, to put as much out there as I could, so that people would be able to understand better the kind of world that we are building after 9/11.

...

WILLIAM ARKIN: Well, I have been doing this for a long time. I think one of the first jobs I had was working for a little non-profit in Washington, DC called the Center for Defense Information. This was in the early 1980's. And I was -- I worked on an article relating to where all the nuclear weapons were in Germany, US nuclear weapons. And I pieced it together by looking at telephone books and various military manuals. And I promptly was fired from my job. You know, big deal. In a way, I can't work somewhere that's not going to support the notion of openness.

As I say in the introduction to the book, you either believe in democracy or you don't. You believe in openness or you don't. There's no way I'm going to convince you of it if you don't believe in it.

So I have been doing this now for almost 30 years. I wrote a book in the 1980's that revealed where all the nuclear weapons were around the world. The Reagan administration was not very happy about it and came down on me pretty hard. And --

AMY GOODMAN: How?

WILLIAM ARKIN: Well, they threatened to throw me in jail. And it took many months of negotiations with the Reagan administration to convince them that I had not used any access to classified information in order to compile that book. That was the key that they would have used as the excuse to put me in jail. So it took many, many months to do that. It was quite a hairy time.

...

AMY GOODMAN: William Arkin, let's step back for a minute to the Pentagon's so-called "black budget." How much of it is secret? How much of it is there congressional overview?

WILLIAM ARKIN: Well, you know, when you look at a guide book of 3,000-plus code names, 600 of which have never been in the public domain before, which means they're not in the budget, they're not in newspaper articles, they've never been published, you know, one of the things that you got to conclude from that is: How can anybody in Congress monitor and oversee all of this activity? I mean, I've spent years on this and have a very tentative grasp upon all of these secrets.

So, I know that there is a statutory requirement for the Pentagon to report the existence of special access programs to the Congress on an annual basis. But most people would be surprised to know that that's done in the form of, literally, a report.

A list of names gets sent forward with a one or two-line description of what the program is, and there are literally a half dozen people within the entire U.S. Congress who have a high enough clearance to read that report.

So, when you're talking about hundreds of programs, and then you're talking about layers of different types of special access programs, I think we can all agree they don't get very effective oversight.

So, you have the double problem of the compartmentalization itself used as a way of avoiding oversight within the Defense Department and within the government.

Lawyers or others don't have access to all these programs; and then you have Congress which is only sort of perfunctorily made aware of the existence of these programs as well.

So, I would conclude, as we've watched again and again and again during the Abu Ghraib scandal or during the whole debate over the handling of prisoners in Guantanamo, that Congress is not effectively monitoring what's going on.

They have a tentative grasp upon the totality of U.S. military and intelligence activities around the world and one of the devices that's used to ensure that the Congress isn't able to monitor it is this alphabet soup of code names which is basically employed to keep it secret.

Arkin described the significant changes of a vast and Byzantine cold war government secrecy system in the post 9-11 world of secrecy. At a minimum, what is lacking today, are public commentaries and discussions on mind control weapons and their characteristics and dangers which go beyond the atomic bomb.

Arkin's book raises the likelihood of developing mind control weapons completely lacking in accountability and oversight. Arkin predicted future scandals as a result of this out-of-control massive secrecy system, including illegal weapons development and human experiments.

Detailed Comments by Richard L. Garwin: The Government Position on Mind Control Weapons

In January 2005, Richard L. Garwin, IBM Fellow Emeritus and co-author of the highly influential Council on Foreign Relations 1999 and 2004 nonlethal weapons reports kindly answered email questions on the history of electromagnetic weapons and the possibility of mind control. For further information on this history, see www.mindjustice.org/2005update.htm#8. The CFR reports are available on the CFR website at <http://www.cfr.org>.

While Garwin is more forthcoming than most government officials, his email answer reflects the long-standing government position.

Monday, January 24, 2005 12:13 PM
Subject: 01/24/05 letter R.L. Garwin to C. Welsh.

...I have evaluated electromagnetic signals for the Defense Department a number of times. Nevertheless, there are always "compartments" to which even people with high-level security clearances do not have access. The "beam weapons" of the 1986 Gorbachev era included lasers, particle beams, and the others. In fact, people are quite durable against electromagnetic impulses.

It is true that the United States is fielding for test and evaluation in Iraq, some millimeter-wave weapons that are intended to provoke intense pain and aversion. The proponents claim that these weapons are harmless, despite the pain, and that the mm-wave source does not damage the eyes, either. I have not seen adequate data on this to make a judgment of my own.

Regarding the "Moscow signal," I certainly do not believe that at the level of that signal, there was any effect at all on people. It is very likely to have been a signal for gathering intelligence from the U.S. Embassy.

While it is true that very intense microwave pulses provided by close-in antenna can produce audible sounds directly in the brain, the Moscow signal was very far from the intensity required to produce such effects. In my analyses of the effect of radiowaves on people, I have never found any significant effect other than heating of the tissues.

...So I don't think there is much in the threat of electromagnetic signals to control or disorient people by the effect on the human brain. Indeed, such stories might serve as a cover for things that we are doing or for information that we don't want to acknowledge having about the other side.

...It is not something that keeps me up at night.

Again, the answer to the question of whether the public will ever find out about mind control weapons from government sources is plainly no.

Conclusions: An Informed Debate and Caveats

The books of Naylor, Ronson and Arkin elevate government mind control from a conspiracy theory label to a serious debate of concern to all. Clarifying the government mind control debate, Naylor and Ronson warn of mind control weapons while Arkin explained the significance of the consequential changes of the post 9-11 government secrecy system- changes which threaten democracy. Garwin, representative of the government's position on mind control, made comments consistent with national security and conditionally denied the existence of advanced mind control weapons, allowing for highly classified programs unavailable even to Garwin for evaluation.

Government mind control is here to stay and is safely under wraps in a post 9-11 world of government secrecy. This seems to explain the extreme difficulty in finding unclassified information, let alone reliable information on the topic of advanced mind control research and national security.

The 2004 Discover Magazine reports neuroscientists believe there is no worry of advanced mind control because the research will take decades. But this ignores the government national security position that mind control weapons are one of the deepest secrets of the nation. Are the neuroscientists who commented for the article conducting classified research? Would the eminent neuroscientists who make the 'advanced mind control is decades away' predictions inform the public of successful mind control research?

The physicist Freeman Dyson described one scientifically feasible mind control theory, although decades away which contradicted Garwin's government position on electromagnetic mind control weapons. Dr. Land, whose supersecret mind control work was funded by the U.S. is indicative of successful mind control weapons. No doubt, only further declassified government documents or solid evidence will resolve the debate.

For now, the victim's position provides a circumstantial case and challenges the 'no advanced mind control weapons' never-varying government position. The pattern of claims of the same cluster of symptoms by the growing number of victims worldwide since the 1960s would seem to be a more reliable indication of how advanced government mind control weapons are.

Russia and the U.S. have classified mind control programs and are officially denying any advanced mind control weapons work. Experts agree mind control is the ultimate weapon and like the atomic bomb, all countries want to develop the weapons if they can.

Arkin wrote of the persisting evidence of national security's authoritative unrestricted position in the U.S. government today, a power that has trumped all U.S. laws. Arkin also warned, " [There are] ...capabilities being developed to go beyond nuclear weapons in cyber-warfare and directed-energy weaponry to nullify enemy weapons- perfectly logical on the one hand, but potentially destabilizing if Russia or some other nuclear power ever perceived that they were part of a "first strike" program." This national security argument and others will effectively keep mind control weapons classified.

Little meaningful public debate on advanced mind control weapons can take place in the current secrecy system. The public will be the last to find out about advanced mind control weapons, at least officially and yet have so much at stake.

The recurrence of illegal secret human experiments and weapons targeting provide harsh lessons for the victims. Declassified government documents were required to expose past national security human experiment scandals. Clearly, victims of current mind control experiments will have to work towards obtaining government documents and evidence of their claims before the government will address the issue seriously. Given the information presented here, it would seem an almost impossible task for victims to obtain the necessary government documents to prove their claims.

National security human experimentation law has remained the same in large part because national security interests are a powerful force in preventing Congress from passing laws on human subjects of experimentation for national security and also on the president, whose executive orders determine the rules for national security experimentation.

The public can now join the real debate underneath the conspiracy label, although it will not be easy. Conspiracy labels are only dismissed with solid evidence. But now an informed debate can provide the possibility for change. A very special thanks to Naylor, Ronson, Arkin and Garwin for their books, report and comments. The courage of Ronson, Arkin and especially Naylor on a personal level, to take the unpopular position against society's most powerful forces is a substantial contribution to the common good and public interests.

About Professor Sims

Professor of Law
A.B., Georgetown University
J.D., Harvard University

Professor Sims clerked for Judge Frank M. Coffin (Chief Judge, U.S. Court of Appeals for the First Circuit). For 11 years, he was an attorney for the Public Citizen Litigation Group, a public interest law firm in Washington, D.C. founded by consumer advocate Ralph Nader. Professor Sims handled a wide range of complex cases at all levels of the state and federal courts, including the Supreme Court of the United States. He was in several significant constitutional cases including *INS v. Chadha* and *Snepp v. United States*. Professor Sims is a founding co-editor-in-chief of the *Journal of National Security Law & Policy*, a faculty-edited, peer-reviewed law journal that is published by Pacific/McGeorge with the participation of national security experts from across the country.

Introduction

It was a great honor for me to have this paper graded by Professor Sims. I knew of Sims in the often-cited 1985 US Supreme Court case, *CIA v. Sims*, a freedom of information lawsuit. The Court held that institutions and individuals who performed research on a project [Project MKULTRA], financed by the CIA, were "intelligence sources" and, therefore, the [CIA] Director was authorized to withhold their identities, to protect intelligence sources and methods from unauthorized disclosure. This paper will discuss the widespread deference to national security as illustrated in the unanimous holding in *CIA v. Sims*. As will be shown below, this deference is also a powerful factor in human subject legal protections for secret government experiments, including the MKULTRA and radiation experiments. National security law provides a valid and reliable framework in which to analyze human research subject protections for national security experiments.

A core question raised in this paper is that a very powerful cold war culture easily thwarts human subject protections advocates who fail to act on their consensus. The CIA's infamous mind control experiments and the illegal radiation experiments on humans were condoned as essential for national security, at the very top levels of the government. The second core question raised in this paper is that a scandal involving classified experiments under the current system of federal regulations has not occurred, but as will be shown, the legal weaknesses of the system are apparent. The legal weaknesses are long-standing in spite of scandal-provoked efforts to remedy them. The weaknesses of the current system of federal regulations are not caused by flaws in the legal system itself. The weaknesses can be shown to be caused in part, by a very powerful but silent cold war culture based on the belief that human experiments are the only feasible means to achieve essential national security goals. This culture overwhelms the majority consensus of advocates for human subject protections whose rhetoric is well-accepted but who fail to act in any meaningful way. The widely-held belief that secret experiments couldn't happen again does not take into account this paradox. As a result, protections for human research subjects in national security experiments have failed and are likely to continue to fail to prevent major scandals without alternative approaches. A 1994 congressional hearing reported that "nearly half a million Americans were subjected to some kind of cold war era tests," often without being informed and without their consent. In addition, experimentation law is well grounded in constitutional and international law. It is an under-reported fact that two major reports on human rights and torture in the U.S. recently listed illegal radiation experiments. Many more facts are documented below. Therefore, human research subject protections should be a high priority and are just as significant as current issues of torture and illegal wiretapping.

[Contents](#) | [Top](#)

Human Research Subject Protections for National Security Experiments

This paper addresses the legal and underlying historical factors that have led to the current status of US law on human research subject protections for national security experiments. A framework of national security law and presidential powers is used and provides a new perspective. Human research subject protections for secret experiments represents a small part of experimentation law although it has a well-established grounding in constitutional and international law. The secret CIA experiments to develop mind control weapons in the 1950s-1970s led to congressionally-imposed federal regulations and presidential executive orders so that illegal experiments on unwitting human subjects would never happen again. Military radiation experiments for the development of the atomic bomb led to executive memorandums ordering federal and intelligence agencies to implement regulations to prevent illegal and unethical secret experiments conducted without the consent of the human research subject. By examining the judicial, executive and legislative response to the two major scandals, strategies and proposals for preventing future illegal experiments for national security are more likely to succeed. So far, experimentation law has not included an analysis using current theories of national security law and presidential powers.

This paper specifically addresses why federal legislation has never been enacted and why the current executive memorandums and executive orders do not protect human subjects of national security experiments. Proposed remedies include enacting a federal statute to provide an effective legal protections for human research subjects of national security experiments. Some presidential scholars have recently studied executive orders and the historical and legal basis of presidential powers.¹ The history of executive orders for human experimentation can be applied to the study of presidential powers. Because human

experimentation for national security experiments is an intelligence matter, the history and framework of national security law also provides an explanation for the long record of failed human subject protections.

First, experts on secret experiments and the law dating back to World War II discuss the major issues including: the cold war CIA experiments that were knowingly conducted outside the bounds of the law; the scientific-military culture of secrecy; the excessive control of all scientific information connected to weapons; and the propaganda and scientific deception surrounding the unethical and illegal radiation experiments. The importance of the cold war culture is that experts are now reporting a great increase of secrecy, new weapons, scientific propaganda and deception, and government actions above the law; all to protect national security.

The fifty year clash between the acknowledged validity of human subject legal protections and the perceived needs of national security is described by many experimentation law experts and they report utilitarian national security interests continue to trump human subject protections. As will be shown, this is carried out by means of: condoning illegal experiments at the very top levels of government; by the executive branch in failing to implement effective protections for human research subjects; by the historically-based acquiescence of Congress to presidential initiative in national security issues and thereby failing to pass effective legislation to protect human research subjects; by the acceptance at top levels of the government of a culture of scientific propaganda and deception including government cover stories; and the classifying of illegal government actions, ordered and implemented by top levels of the government for national security purposes. This pattern was in place for CIA mind control experiments, for radiation experiments and continues today, experts report.

This paper will address the judicial, legislative and executive response to human subject protections and the finding that the system of law works as well as in similar intelligence matters. As will be shown, the legal approach to solving this issue is dependent on a political question; the continuing cold war culture that allows the government to work outside of the law and to go unpunished.

The first section identifies and defines the problem of human subjects protections for national security experiments. The next section presents a history of experimentation law beginning with the Nuremberg Code and the well-grounded basis for human subject protections in international and constitutional law. Next, the judicial branch response to illegal human experiments is followed with sections on the failed attempts of the executive and legislative branches of government to address human subjects protections as seen in several 1990-2005 government reports on experimentation. This section includes an analysis of the shared powers between the executive and legislative branches over national security issues within the framework of national security law and presidential powers. The final section covers the argument for a federal statute and other possible remedies.

[Contents](#) | [Top](#)

The problem: a serious lack of human subject protections for national security experiments and a continuing cold war mentality

Past military and CIA experiments with toxic chemicals and for behavior modification were headline news in the 1970s. Congressional hearings uncovered illegal and extensive government programs including the CIA's now infamous MKULTRA mind control experiments. At the 1977 hearing on *Project MKULTRA: The CIA's Program of Research in Behavior Modification*, Senator Daniel Inouye reassured many when he stated that "we are reviewing past events in order to better understand what statutes and other guidelines might be necessary to prevent the recurrence of such abuses in the future."² Legislation in 1978 established a *President's Commission For the Study of Ethical Problems in Medicine, and Biomedical and Behavioral Research* and in 1981, federal regulations were strengthened.³ President Ford signed an executive order banning intelligence agencies from conducting human experiments without the consent of the research subject and the order referred to the 1976 Department of Health, Education and Welfare (DHEW) Regulations (45 CFR 46) Protections for Human Subjects as the standard of human subject protections to be applied by the CIA and intelligence agencies.⁴ A March 26, 1977 CIA memorandum on *Guidelines for Human Subject Research* implemented the policy: "pursuant to Section 102 of the National Security Act of 1947, Executive Order 11905 and National Security Council Intelligence Directives, a policy is hereby established for the protection of human subjects of research activities conducted or funded by the Central Intelligence Agency."

Executive orders are described as:

a form of "presidential legislation" or "executive lawmaking," in the sense that they provide the president with the ability to make general policy with broad applicability akin to public law. For over a century the Supreme Court has held that executive orders, when based upon legitimate constitutional or statutory grants of power to the president, are equivalent to laws.⁵

Today, most executive orders waive the right to sue or enforce the order. Without legal enforcement, a law is relatively meaningless. Enforcement of executive orders is almost impossible:

[T]he ability of private citizens to pursue claims through the courts. Claimants can, of course, challenge the validity of executive orders on the grounds that they exceed the president's constitutional or statutory authority. Additionally, as a general rule the courts have jurisdiction in disputes arising over executive orders issued pursuant to delegated statutory authority, or those directed at nongovernmental parties. In practice, however, it is almost impossible for private claimants to allege violations of an executive order itself or seek damages as a remedy for violations against another private party. Recent court rulings are consistent on this point, holding that executive orders do not generally permit citizens to insist on judicial enforcement of the orders' requirements.⁶

The 1977 *MKULTRA* hearing explained how the executive branch consulted with Congress about human subject protections. Senator Kennedy stated:

Two years ago, when these abuses were first revealed, I introduced legislation, with Senator Schweiker and Senator Javits, designed to minimize the potential for any similar abuses in the future. That legislation expanded the jurisdiction of the National Commission on Human Subjects of Biomedical and Behavioral Research to cover all federally funded research involving human subjects. The research initially was just directed toward HEW activities, but this legislation covered DOD as well as CIA. . . . The CIA supported that legislation in 1975, and it passed the Senate unanimously last year. I believe it is needed in order to assure all our people that they will have the degree of protection in human experimentation that they deserve and have every right to expect.⁷

Kennedy's legislation did not pass and President Ford's executive order for intelligence agencies preempted Kennedy's legislative attempts, as the national security law and presidential powers framework would predict. "In a pattern at the core of executive institutional power, presidents have moved to fill in the gaps in authorizing legislation with their own interpretations, outflank congressional efforts to impose more substantive restrictions, and maintain the initiative in important policy areas."⁸

Congressional and executive efforts to prevent *MKULTRA* from happening again did not address the underlying problem- that the CIA had knowingly operated beyond the statutes preventing domestic activities by the CIA and constitutional law. Experimentation without the consent of the human research subject is a violation of the U.S. Constitution, specifically: the Fourth Amendment proscription against unreasonable searches and seizures (including seizing a person's body), the Fifth Amendment's proscription against depriving one of life, liberty or property without due process, and the Eighth Amendment's prohibition against the infliction of cruel and unusual punishment.⁹ A 1963 CIA inspector general's report on *MKULTRA* acknowledged the illegalities. "Some [of these] activities raise questions of legality implicit in the original charter. [The charter is congressionally approved]. . . . A final phase [of some of these projects] places the rights and interests of US citizens in jeopardy."¹⁰ Law professor Alan Schefflin examined thousands of declassified CIA documents and concluded, "There are dozens of CIA memos that attest to the illegal and unethical nature of its work. . . . It is difficult not to conclude that the CIA is above the law and unhampered by Congress, the American public or the occupant of the Oval Office of the White House."¹¹

Another of many clear examples of the CIA operating above the law and with the implicit approval of the executive branch was reported in a 2002 *San Jose Mercury News* article:

New files from a UC Davis history professor showed White House officials had intentionally withheld details of Frank Olson's death from the family.[Olson was the CIA scientist who allegedly jumped to his death from a hotel room in 1953 after being surreptitiously given LSD by the CIA.] They included a memo from Dick Cheney,[now vice president] a White House assistant at the time, to Donald Rumsfeld,[now secretary of defense] the chief of staff, on July 11, 1975, one day after the Olsons first held a news conference. The memo warned that a

lawsuit could involve “the possibility that it might be necessary to disclose highly classified national-security information in connection with any court suit or legislative hearings on a private bill.” The documents also include memos written by White House Counsel Roderick Hills to the president that were routed through Cheney and other officials. . . . As a result, Hills urged settling the case out of court.

Cheney and Rumsfeld completely ignored the illegality of giving Olson LSD without his consent as part of extensive illegal CIA LSD experiments. They did not volunteer to turn over this information to the Department of Justice for prosecution, for example. Instead the recommendation by White House Counsel was to keep the information classified while citing national security concerns.¹²

The strengthened federal regulations as a result of the MKULTRA scandal were not in effect until the mid-1970s. The unethical and illegal radiation experiments, publicly revealed in 1990s front page news occurred from the 1940s through the early 1970s. President Clinton appointed the Advisory Committee on Human Radiation Experiments (ACHRE) and its 1995 report said the federal government was “blameworthy for not having had policies and practices in place to protect the rights and interests of human subjects” in several thousand experiments.¹³ The ACHRE report recommended strengthening federal regulations: “The Advisory Committee recommends . . . the adoption of a federal policy requiring the informed consent of all human subjects of classified research and that this requirement not be subject to exemption or waiver. In all cases, potential subjects should be informed of the identity of the sponsoring federal agency and that the project involves classified information.”¹⁴

The ACHRE report went further and addressed some of the underlying problems of secret experiments:

It also is possible that a prohibition on classified human subjects research would be circumvented through redefinition of activities or disregarded outright. . . . The Advisory Committee believes, however, that the classification of human subject research ought properly to be a rare event and that the subjects of such research, as well as the interests of the public in openness in science and in government, deserve special protections. The Advisory Committee does not believe that continuing with the current federal policy governing the protection of human subjects, which does not provide any special safeguards or procedures for classified research is adequate. In the current political context, classified human subjects research occurs relatively rarely. Existing policy may prove an inadequate safeguard of individual rights and welfare, however, if in the future national security crises occur that generate a perceived need for classified research. The convergence of elements of secrecy, urgent national purposes, and the essential vulnerability of research subjects, owing to differentials in information and power between those conducting research and those serving as subjects, could again lead to abuses of individual rights and, upon subsequent revelation, the erosion of public distrust in government.¹⁵

And yet there have been no effective changes in the law since the 1995 ACHRE report. Federal regulations and the executive order for classified research have remained unchanged. A 1997 Clinton presidential *Memorandum on Protections for Human Subjects of Classified Research* was addressed to government agencies under the current federal regulations for human experiments.¹⁶ The memorandum was adopted only by the Department of Defense, there are no effective mechanisms to implement the memorandum and it was not adopted by intelligence agencies.¹⁷ The memorandum stated: “All agencies that may conduct or support classified research . . . shall jointly propose to prohibit waiver of informed consent for classified research. . . . Agencies shall, within 1 year, . . . promulgate final rules on the protection of classified research.”¹⁸ This was not done. The memorandum continued: “Beginning one year after the date of this memorandum, no agency shall conduct or support classified human research without having proposed or promulgated [federal rules on experimentation] . . . , including the changes set forth in this memorandum”¹⁹ As one expert pointed out, there are no rules or mechanisms for oversight and accountability, or for how classified research is to be reviewed and conducted. In practice, this memorandum was a weak and ineffective legal document.

As critical as the ACHRE report was of secret government experiments, many others have expressed stronger concerns and have identified other root causes of the continuing problem of human subject protections. Pulitzer prize-winning reporter Eileen Welsome testified before a 1994 congressional hearing, *Radiation Testing on Humans* about the difficulties she encountered with the Atomic Energy Commission (AEC) in uncovering her story on eighteen Americans injected with plutonium between 1945 and 1947 in radiation experiments.²⁰ Her news accounts led to the public exposure of radiation experiments in the early

1990s.²¹ In her 1999 book, *Plutonium Files, America's Secret Medical Experiments in the Cold War*, Welsome described that ACHRE "conclusions are weak and fail to come to terms with many of the controversial studies."²² Welsome explained the cold war culture surrounding radiation experiments is largely overlooked or ignored. An excerpt of Welsome's book describes this culture, and as will be shown below, this culture is continuing in new weapons programs today:

Many scientists couldn't accept the idea that they or their peers had committed any wrongs. They maintained their belief that the ends they had pursued justified the means they used, expressed little or no remorse for the experimental subjects, and continued to bash . . . the media for blowing the controversy out of proportion. . . . A few of the experiments increased scientific understanding and led to new diagnostic tools, while others were of questionable scientific value . . . [There was a] pervasive deception that the doctors, scientists, and military officials routinely engaged in even before the first bomb had been detonated. General Leslie Groves [head of the Manhattan Project to build the first atomic bomb] lied egregiously when he testified to Congress in 1945 about radiation effects of the bomb. "A pleasant way to die," he said-fully aware of . . . [what happened to the Japanese victims and in a fatal laboratory accident.] Stafford Warren [director of the Manhattan Project's Medical Section] downplayed the fatalities and lingering deaths in Japan. . . . During the war, the bomb makers believed that lawsuits would jeopardize the secrecy of the project. After the war they worried that lawsuits would jeopardize the continued development of nuclear weapons . . . The weaponeers recognized that they would have to allay the public's fear of atomic weapons in order to keep the [US plutonium] production plants operating . . . This meant an aggressive propaganda campaign about the "friendly atom" and the suppression of all potentially negative stories about health hazard related to atomic energy . . . AEC officials routinely suppressed information about environmental contamination caused by weapons plants . . . The fact is, the Manhattan Project veterans and their proteges controlled virtually all the information. They sat on the boards that set radiation standards, consulted at meetings where further human experimentation was discussed, investigated nuclear accidents, and served as expert witnesses in radiation injury cases.²³

This cold war culture was and is instrumental in overshadowing the ethics of human subject protections as held by professionals in the 1950s and today. For example, a 1996 *Journal of the American Medical Association (JAMA)* reported the reaction of the medical community to the 1995 ACHRE report with calls for more voluntary reforms and weak sanctions:

"Today, consensus exists that duties to obtain informed consent apply to all human subjects, whether healthy or sick, regardless of the risk or potential for medical benefit from participation in the research and regardless of the nature of sponsorship or funding (e.g. federal, military, or private). Based on a finding of serious deficiencies in the current system of protections for human subjects, recommendations include accountability and sanctions for ethics violations."²⁴

Ten years after the *JAMA* article, no laws are in place to implement the consensus for a duty to obtain informed consent in human experiments. The core question raised in this paper is that the very powerful and silent cold war culture described by Welsome easily thwarts human subject protections advocates. The widely-held belief that secret experiments couldn't happen again does not take into account the paradox that this majority fails to act on their very vocal consensus for informed consent in experiments.

The testimony of Columbia University Professor John Rothman, at a 1994 hearing on *Cold War Human Subject Experimentation* further explains by illustrating how a very calculated government policy incorporates the unspoken but widespread belief of the need for illegal human experiments as essential to national security. This policy is well-funded with defense dollars and government action; thereby easily overpowering the consensus of professional communities who are offer rhetoric but no serious action for protecting human subjects:

If the ethics of experimentation were so clearly established, why did American investigators so frequently violate them? Well, I think the essence of the answer is the war effort, first in 1940 to 1945, then the cold war effort after 1945, fostered what we might call highly utilitarian judgments. Investigators made the calculus that the national interest outweighed individual rights, that the exigencies of the cold war justified violations of known ethical practices. . . . I was most impressed this morning with the questioning that went on about the chain of command. Who was it that allowed or finally passed off on the experiment? How did it work its

way through? Was it simply, well that is a fine idea, let's go out and do it? Was there anything approximate meriting chain of command? Was there anything approximating signoff? . . . And if we are going to set up various kinds of corrective measures, I think that knowledge is absolutely essential.²⁵

There are indications that today, the intelligence agencies and industrial-military complex are repeating the cold war deception and patterns described by Welsome. Human rights experts describe "new" weapons of mass destruction, after the atomic bomb that have also been classified for decades, involve top government officials and scientists, and reports of government actions beyond legal limits. Coupled with the continued secrecy and growth of national security, these factors are a valid challenge to the view that future illegal experiments won't happen again. A 2002 *Richmond Times-Dispatch* described the increased secrecy surrounding experiments:

"It borders on the scandalous that we still don't have rules in place that would at least begin to protect the people who are in those trials," cautioned Jonathan D. Moreno, director of the Center for Biomedical Ethics at the University of Virginia. . . . Moreno pointed to a December news report that President Bush had given the secretary of health and human services [HHS] the authority to classify the information as secret. Moreno said that could allow the Defense Department or CIA to undertake secret human experiments with the HHS.²⁶

In his 1999 *New York Times* reviewed book, *Undue Risk, Secret State Experiments on Humans*, Moreno wrote that national security concerns will outweigh human subject protections:

Today and ever since the end of the World War II, the universal sensitivity about human experiments is coupled with the fact that they are probably unavoidable in the real world of national security. Textbook theories, laboratory experiments, and computer and animal models can only go so far. At some point, when information is needed about how human beings will react to new forms of weaponry, human experiments will have to continue in this business. In a dangerous world one might well argue that it would be irresponsible for us not to do so.²⁷

Dr. Moreno warned of today's new weapons and the inevitability of unethical classified government experiments:

In the next century, as in the past, military medical research involving human subjects will be dictated by the limits of information available from other sources. Because a new generation of weapons is being developed that are intended to incapacitate rather than kill an enemy, computer simulations and animal models can only go so far. Among the next generation of weapons is one that may involve a different sort of radiation than that emitted by atomic fission: microwaves. Electromagnetic waves may be used to disrupt an enemy soldier's central nervous system, to cause epileptic seizures.²⁸

In 2005, military intelligence, secrecy expert and *Washington Post* columnist William Arkin described the illegalities beneath national security secrecy: "As I have learned . . . most genuine secrets ironically remain secret. . . . Yet Abu Ghraib is like every other national security surprise: We cannot know who the players are or what they are up to until after disaster strikes." Arkin listed "other national security surprise" including "domestic spying operations, illegal weapons developments, and human experimentation."²⁹

Most national security issues are resolved politically: the issue of secret experiments seems to be in need of a political as well as a legal remedy, as seen in these larger issues that directly affect human subject protections for national security experiments. The two newspaper articles to follow are examples of Welsome's cold war culture continuing in current weapons programs, characterized by a lack of accountability and oversight. This briefly explains some of the factors that need to be addressed in human subject protections today in order to change the past failures of human subject protections. A 2005 *Washington Post* article described extreme secrecy surrounding new weapons and possible illegal acts.

Further, Granite Shadow posits domestic military operations, including intelligence collection and surveillance, unique rules of engagement regarding the use of lethal force, the use of experimental non-lethal weapons, and federal and military control of incident locations that are highly controversial and might border on the illegal. Both plans seem to live behind a veil of extraordinary secrecy because military forces operating under them have already been given a series of "special authorities" by the President and the secretary of defense. These special authorities include, presumably, military roles in civilian law enforcement and abrogation of

State's powers in a declared or perceived emergency.³⁰

A 2005 *New York Times* article reported a lack of legislative and executive oversight and accountability for new weapons programs:

Republican members of Congress say there are signs that the Defense Department may be carrying out new intelligence activities through programs intended to escape oversight from Congress and the new director of national intelligence. . . . The lawmakers said they believed that some intelligence activities, involving possible propaganda efforts and highly technological initiatives, might be masked as so-called special access programs, the details of which are highly classified. The report said the committee believed that "individual services may have intelligence or intelligence-related programs such as science and technology projects or information operations programs related to defense intelligence that are embedded in other service budget line items, precluding sufficient visibility for program oversight." "Information operations" is a military term used to describe activities including electronic warfare, psychological operations and counterpropaganda initiatives.³¹

As will be further detailed below, experts on past experimentation scandals cite this largely political information as definitive, yet repeatedly ignored when addressing human subject protections. Could human experiments similar to past national security scandals happen today? Most people, including Steven Aftergood of the Federation of American Scientists Secrecy Project think the possibility is almost zero.³² The new analysis in this paper will challenge this widely-held view. The argument can be made that it's a scandal waiting to happen, although taking into account increased secrecy and technological advances, it remains to be seen how the next scandal may unfold.

The Nuremberg Code-cited by most legal experts but ineffective against the powerful medical, pharmaceutical and military lobbies

The Nuremberg Code is the "most complete and authoritative statement of the law of informed consent to human experimentation."³³ It is also "part of international common law and may be applied, in both civil and criminal cases, by state, federal and municipal courts in the United States."³⁴ But when applied to cold war national security and to the Gulf War, the Nuremberg Code has proven to be legally powerless. Law professor and expert on experimentation law for over twenty years, George Annas explained:

"Even when the Nuremberg Code applies directly we have never taken it seriously. We say that the rights of the individual are outweighed by national security concerns. This has been true even where those concerns are unclear or unarticulated, as where the experiments are carried out in secret and produce death and permanent disability. . . . when medical progress has been invoked, ethics continues to take a backseat to expediency."³⁵

The Nuremberg Code has its' beginnings in the Nuremberg Doctors' Trial in 1947. The trial of twenty German doctors, charged with war crimes and crimes against humanity focused on the infamous human experiments on unconsenting prisoners in the Nazi concentration camps during World War II. The judgment concludes with the ten point code of human experimentation ethics, the Nuremberg Code. The first rule is that the voluntary consent of the human subject is absolutely essential.³⁶

The first rule of the Nuremberg Code is included in the current federal regulations on experiments. "The Common Rule" which is today adopted by eighteen federal agencies, are the federal rules that cover both classified and unclassified experiments and include the cornerstone of human experimentation law, informed consent of the research subject.³⁷ While the Nuremberg Code has had far reaching effects, it was seen as "good code for barbarians but an unnecessary code for ordinary physicians."³⁸

The Nuremberg Code became part of international common law, an indication of its importance. The prohibition against torture in Article 7 of the International Covenant on Civil and Political Rights, states that "no one shall be subject without his free consent to medical or scientific experimentation."³⁹ Most experts view the Nuremberg Code as a significant, yet symbolic document. The highly regarded law professor M. Cherif Bassiouni regards human experimentation as a serious violation "of fundamental human rights

affecting life, physical integrity and personal liberty.”^{40, 41} Bassiouni believes that a code of ethics does not go far enough, as the history of the Nuremberg Code has shown. Bassiouni described unlawful human experimentation as a crime against humanity and a crime under international law.⁴² Bassiouni unsuccessfully proposed that the United Nations adopt a specific criminal *Covenant on Human Experimentation* in the 1980s.⁴³ He included the *Draft Convention for the Prevention and Suppression of Unlawful Human Experimentation* in his 1999 *International Criminal Law* casebook.⁴⁴

Bassiouni has commented on the powerful influence of the pharmaceutical lobbies on international experimentation law proposals.

In its work, the Sub-Commission adopted a resolution that would have authorized a Special Rapporteur to ‘prepare a study on the current dimensions and problems arising from unlawful human experimentation.’ The resolution was referred to the Commission on Human Rights for action or consideration. It seems, however, that no further steps were taken.⁴⁵

Bassiouni believes one possible explanation is that representatives of certain countries feared such a convention would infringe on the practices of their pharmaceutical industries. Bassiouni’s decades-long work and endorsement of international experimentation law is a further indication of its acceptance.⁴⁶

Annas explained the conflict between the Nuremberg Code and national security priorities in the 1950s and 60s:

The wartime mentality expressed by the CIA and the Army to justify its LSD experiments, and the Army to justify its atomic bomb exposure experiments, is substantially identical to one of the major defenses presented by the Nazi physicians at Nuremberg. Remarkably, the Nuremberg Code appears to have had no effect on medical researchers even in the 1950s.⁴⁷

The Nuremberg Code was cited by the Pentagon in the “Wilson Memorandum” signed by Secretary of Defense, Charles E. Wilson on February 26th, 1953.⁴⁸ The Armed Forces Medical Policy Council presented the memo which described a policy for human military experiments including “the principles and conditions laid down as a result of the Nuremberg trials.”⁴⁹ But as Moreno described in his book on secret experiments, the military culture never accepted this policy and it was largely ignored until the 1960s, when public and military human experiment scandals forced changes in federal rules and regulations.⁵⁰ In 1978, the National Commission for the Protection of Human Subjects of Biomedical and Behavioral Research published ethical guidelines including some of the Nuremberg principles.⁵¹ Moreno stated “These [Nuremberg] principles are still the touchstone for human research ethics in the United States, including that which is conducted by national security agencies.”⁵²

Experimentation law is firmly rooted in the constitution and international law

Two recent human rights reports describe the legal foundation of constitutional and international law for human experiments. The reporting requirements for the United States Department of State to the UN Human Rights Committee included a section on human experiments. A relatively under-reported but significant fact is that the illegal radiation experiments were cited as an example of noncompliance by the US government with the International Covenant on Civil and Political Rights (ICCPR). This fact illustrates the acceptance of experimentation law by the international human rights community. This 1994 report stated that under Article 7 of the ICCPR, freedom from torture or cruel, inhuman, or degrading treatment or punishment: “The United States considers itself bound by Article 7 to the extent that ‘cruel, inhuman or degrading treatment or punishment’ means the cruel and unusual treatment or punishment prohibited by the Fifth, Eighth and/or Fourteenth Amendments to the Constitution of the United States.”⁵³ The report continued:

Medical or Scientific Experimentation. Nonconsensual experimentation is illegal in the US. Specifically it would violate the Fourth Amendment proscription against unreasonable searches and seizures (including seizing a person’s body), the Fifth Amendment’s proscription against depriving one of life, liberty or property without due process, and the Eighth Amendment’s prohibition against the infliction of cruel and unusual punishment.”⁵⁴

The following human rights report, as with the above 1994 human rights report, included radiation experiments as a violation, not of the ICCPR but the Convention Against Torture (CAT) and further supports the grounding of experimentation law in international law.⁵⁵ Those working in international law are reporting illegal radiation experiments in reports on human rights abuse in the U.S., a further indication of the importance of experimentation law.

The following excerpt is from the 1998 report entitled *Torture in the United States* by the World Organization Against Torture, a coalition of human rights groups. The report explains why experimentation law applies to the ICCPR and CAT, as well.

The prohibition against torture in Article 7 of ICCPR, stipulates that “no one shall be subject without his free consent to medical or scientific experimentation.” This provision is not included in CAT, which focuses in Article 1 on pain inflicted for punishment or intimidation, or for any reason based on discrimination. However, it was the overwhelming consensus of our working group that human scientific experimentation conducted by the government without the knowledgeable consent of victims constitutes, by its very nature, a type of punishment that fits within the CAT definition as constituting “severe pain and suffering” as described by CAT. There is no question that the human experiments conducted by the Nazis during World War II constituted torture, despite their alleged scientific purposes, because the dangers and inhumanity victims were subjected to evidenced an essential lack of concern for the well-being of the subjects that resulted in the unnecessary infliction of pain and suffering. Similar elements that constitute punishment under the meaning of the CAT definition are present whenever human beings are unknowingly subjected to scientific tests, especially when they involve potential severe or long-lasting health consequences, or the purposeful denial of appropriate medical care. This type of disdain for human subjects can not be viewed as anything other than the purposeful infliction of punishment, even if legitimate scientific goals are involved, and the intent to do harm may not be present. It is the lack of due care for the severe (though unexpected) consequences that produces the pain and suffering of the type prohibited by CAT. This is the reason why the ICCPR makes special mention of human scientific experimentation under its treatment of torture, and justifies its inclusion among the activities subject to review under Article 1 of CAT.”⁵⁶

Experimentation law and the judicial system

General principles and trends of national security law can be applied to judicial decisions relating to secret experiments and experimentation law. National security is allocated to the president as part of the constitutional mandate to “take care that the laws be faithfully executed.”⁵⁷ A very general trend can be described as follows. Historically, the general trend is that the areas of national defense and foreign relations have been presidential territory while the judicial and congressional branches avoid these areas and acquiesce to the executive, although, the framers of the Constitution meant for the executive and legislative branches to have shared powers.⁵⁸ In practice there are shared powers between the three branches but the proportions have changed over the years and are dependent on the topic.⁵⁹ National security powers of congress are described in Article I of the Constitution. No constitutional text on national security and the judiciary can be found but the judiciary has a role in deciding disputes among the two branches, congress and the executive. The court holdings in national defense and foreign affairs are generally narrow and few in number. The courts have failed to give authoritative answers on national security questions.⁶⁰

There are range of constructions of the Constitution regarding national security because the text is not precise and it does not prescribe power over some important national security areas. The original understanding of the allocation of national security powers can't be found from the Constitution alone. Most national security issues are resolved in the political process.⁶¹

Human experimentation case law reflects historical national security trends and generalities. The few court rulings on issues raised by post cold war experiments fit the trend for national security issues: the rulings are narrow and leave many questions unanswered.

One 1987 Supreme Court case directly on point is *United States v. Stanley*.⁶² This case is widely cited in

experimentation law. The ruling has not been overturned although there have been some negative discussions in subsequent cases. "The technical point decided by this case was whether an active duty serviceman could sue the US government for money damages for injuries sustained as a result of experimentation that violated the Nuremberg Code."⁶³ James Stanley was unwittingly given LSD as part of the army's program to determine the effects of LSD on humans. Stanley suffered from "hallucinations and periods of incoherence and memory loss."⁶⁴ His marriage fell apart. "Stanley was denied compensation for injury by the army and sued under the Federal Tort Claims Act alleging negligence in the administration, supervision, and follow-up monitoring of the drug research program."⁶⁵ This is one of the few cases to cite the Nuremberg Code. Justice Scalia wrote the opinion of this 5-4 decision and denied Stanley's claim for recovery.

Justice Scalia held that a constitutional violation provides no justification for departing from the general rule that injuries that "arise out of or are in the course of activity incident to service" shall not give rise to a cause of action for money damages, the *Feres* doctrine.⁶⁶

In her dissent, Justice O'Connor quoted the Nuremberg Code and stated;

"[the conduct at issue in Stanley could not] 'arise out of or in the course of activity incident to services' [because the conduct] 'is so far beyond the bounds of human decency that as a matter of law it simply cannot be considered a part of the military mission.' . . . No judicially crafted rule should insulate from liability the involuntary and unknowing human experimentation alleged to have occurred in this case. . . . voluntary consent of the human subject is absolutely essential. . . to satisfy moral, ethical and legal concepts."⁶⁷

Justice Scalia and O'Connor's positions are extremely polarized in an almost equally divided court decision and seems to be a continuation of the ongoing debate which began after World War II over whether to implement and put into practice, the principles of the Nuremberg Code.

Elizabeth Barrett fought court battles for years on behalf of her father, Harold Blauer, "who died after being injected, against his will, with a synthetic mescaline derivative supplied secretly by the US Army Chemical Corps in the early 1950s."⁶⁸ After Senate hearings, Barrett won a \$702,044 judgment in May 1987. In 1988, after an eight year court battle, eight victims of CIA depatterning experiments in Canada won \$750,000 settlement from the CIA, which admitted no guilt.⁶⁹

In re Cincinnati Radiation Litigation was a 1995 federal case against thirteen researchers and their hospitals for 1960s nonconsensual radiation experiments on low income terminal cancer patients in Cincinnati, with Department of Defense funding. Judge Sandra Beckwith's holding cited the Nuremberg Code and stated, "The Code developed at Nuremberg had become 'part of the law of humanity, even if it were not afforded precedential weight in the courts of the United States,' it could not be 'readily dismissed in this case.'"⁷⁰ Beckwith cited the 1953 Wilson Memorandum as one example of "a mirror of the Nuremberg Code."⁷¹ She ruled that the plaintiff's constitutional rights may have been violated when the defendants acted "beyond the bounds of the powers delegated to them" and the plaintiff's allegations overcame the defense of qualified immunity. After years of court battles and settlement negotiations, the parties settled out of court.⁷²

This series of cases are not representative of the thousands of victims of government cold war experiments. It is a well-established fact that most victims of MKULTRA, the CIA mind control experiments have never been informed by the government about their involvement. "Internal memos and depositions taken from CIA officials . . . reveal that of the hundreds of experimental subjects used in MKULTRA, only fourteen were ever notified and only one was compensated- for \$15,000."⁷³ This pattern of flagrant abuse has been called "inexcusable" and "just one example of the many broken promises" by legal authorities on the issue and the problem is continuing with radiation experiments.⁷⁴

Typically, only a few cases survive this legal battle. James Turner, a lawyer in *Orlikow v CIA* case of brainwashing, stated, ". . . the courts and the agencies now have made it virtually impossible for a victim to succeed in a legal claim. Records are gone, key witnesses have died, people have moved; in the drug testing cases, people are damaged in other ways, which undermines their credibility."⁷⁵

Remedies under The Federal Tort Claims Act (28 U.S.C. Section 2674) have been denied in actions involving discretionary power of government officials. Government sovereign immunity is retained based on discretion, "a public official's power or right to act in certain circumstances according to personal judgment and conscious."⁷⁶ Federal court cases have consistently held in cases of exposure to atomic radiation

testing that it is with the government's discretion "whether to tell citizens about hazards of radiation exposure."⁷⁷

The history of judicial opinions involving cold war national security experiments indicate that most victims never overcome the many legal hurdles such as the Feres Doctrine. Another roadblock, is the doctrine of judicial restraint, used by the Supreme Court in its elimination process of the many cases which come before it. The courts consider many national security issues as political questions; questions best resolved by the executive or legislative branches.⁷⁸ The few judicial opinions on experimentation law and the lack of judicial remedies for a majority of illegal experiments reflects the deference to national security by the courts and also the influence of the national security and the cold war culture on society, rather than a failure of the legal doctrines.

Experimentation law and the executive branch

National security powers in relation to the presidency have been described as follows: "[T]he constitutional origin of the president's control over intelligence is ambiguous, determined more by tradition, executive initiative, and congressional acquiescence than by any explicit grounding in the law."⁷⁹ Similarly, the executive branch has predominated in classified experimentation law by implementing a series of presidential executive orders, beginning with executive orders issued as a result of the CIA MKULTRA secret experiments of the 1950s-70s to President Ronald Reagan's 1981 executive order (EO) 12,333 in effect today.⁸⁰ The executive orders on human experiments have not changed for the most part. EO 12,333 cites and follows the Code of Federal Regulations (CFR), Title 45 CFR Part 46, which are the current rules for protections of human subjects in both classified and unclassified experiments. In 1991, fifteen federal agencies codified the regulations and the CIA updated the regulations to the current executive order on experimentation. EO 12,333 still includes "Section 2.10 Human Experimentation. No agency within the Intelligence Community shall sponsor, contract for or conduct research on human subjects except in accordance with guidelines issued by the Department of Health and Human Services. The subject's informed consent shall be documented as required by those guidelines."⁸¹

Informed consent of the research participants, institutional review board approval of research conditions and other human subject protections have been a part of the federal rules since 1974.⁸² Significantly, the current regulations include CFR Part 46 section 46.101(i). This section allows for a waiver of any or all of the CFR regulations and for a statute or executive order to override the notification and publication requirements. Section 46.101(i) states: "Unless otherwise required by law, Department or Agency heads may waive the applicability of some or all of the provisions of this policy . . ." This waiver of any of the federal regulations provisions effectively nullifies the regulations, allowing for a total lack of protections for human subjects of classified research at the discretion of Department or Agency heads and under total secrecy.

For the most part, the secret radiation experiments were conducted under a haphazard system endorsing the Nuremberg Code; before the system of federal regulations and the executive orders on human experiments were in place. In 1993, the radiation scandal was exposed. The experiments on human subjects attracted intense media interest. They were even called "an enormous scandal for science and government, greater than Watergate."⁸³ President Clinton appointed the ACHRE to investigate and make recommendations. ACHRE found that the national security establishment in the 1950s were well aware of the Nuremberg Code. For example, the ACHRE "could conclude with certainty that the AEC (Atomic Energy Commission) was aware of the potentially negative legal and public relations effects of publicity surrounding the plutonium injection [late 1940s experiments]."⁸⁴

The 1950s debate over applying the Nuremberg Code to military experiments continued when Defense Department lawyer, Stephen S. Jackson reported that the Nuremberg Code principles would have to be used in their entirety because they "already had international judicial sanction."⁸⁵ The ACHRE reported that highly classified discussions resulting in the promulgation of Secretary of Defense Wilson's 1953 human subjects memo. The Nuremberg Code was seen as unrealistic by the Pentagon professional community, in light of national security concerns and was ignored in most cases.⁸⁶

The *ACHRE Final Report* concluded that "with respect to classified research, the current requirement of informed consent is not absolute; if consent is waived, the research may proceed in ways that do not

adequately protect the research subject."⁸⁷ President Clinton incorporated many of the ACHRE recommendations in his 1997 presidential memorandum, but the memorandum was only adopted by the Department of Defense. The Department of Health and Human Services (HHS) has not adopted the new regulations, and the CIA in turn has not adopted the regulations, since intelligence agencies follows HHS regulations on human experiments, as directed by Executive Order 12,333.⁸⁸

The second core question raised in this paper is that a scandal involving classified experiments under the current system of federal regulations has not occurred, but as will be shown, the legal weaknesses of the system are apparent. The legal weaknesses are long-standing in spite of scandal-provoked efforts to remedy them. The weaknesses of the current system of federal regulations are not caused by flaws in the legal system itself. The weaknesses can be shown to be caused by the very powerful but silent cold war culture described by Welsome, which easily thwarts the majority of advocates for human subject protections who fail to act on their consensus. As a result, protections for human research subjects have failed to prevent major scandals.

The inherent weakness of executive memorandums and orders are that they are "subject to evasion, rescission, or modifications the commander in chief sees fit."⁸⁹ A 2003 *US News and World Report* article entitled *Keeping Secrets: The Bush Administration is doing the Public's Business Out of the Public Eye. Here's How-and Why*, provides an example:

Bush's chief of staff, Andrew Card, directed federal agencies to freeze more than 300 pending regulations issued by the administration of President Bill Clinton. The regulations affected areas ranging from health and safety to the environment and industry. The delay, Card said, would "ensure that the president's appointee's have the opportunity to review any new or pending regulations."⁹⁰

President Clinton's memorandum for classified experiments became a part of the above review. A recent example of a waiver of consent in an executive order on grounds of military expediency was signed on Sept. 30, 1999 by President Clinton. As shown above, the ACHRE had actually warned about the possibility of redefining a medical problem in order to avoid the consent requirement.

A new executive order empowers the President to authorize "investigational" medicines for troops without their consent. The Clinton executive order sets down procedures for permitting drugs to be administered by the Department of Defense without consent, the conditions under which the practice will be allowed, and the approvals and reviews that must be obtained.⁹¹

Arthur L. Caplan, director of the Center for Bioethics at the University of Pennsylvania commented:

"[O]ne way to make sure requests are rare (for untested drugs to be given to troops) and compliance is thorough is for some articulation of what a compensation policy might be if harm occurs. . . . That might be the best measure to ensure that requests are going to be infrequent to waive informed consent and that if they are granted that there's going to be serious tracking of what happens to people who don't get to give permission when something new is used." . . . but the fact is that when you're using new experimental innovations you are then creating an experiment.⁹²

Presidential directives have differing levels of power as described here. President Clinton's memorandum on classified experiments was weaker than if he had made the memorandum an executive order:

The major classes of presidential policy instruments such as executive orders, proclamations, memoranda, administrative directives, findings and determinations, and regulations. Of these, executive orders combine the highest levels of substance, discretion, and direct presidential involvement. . . . executive orders are a "more far reaching instrument for administrative legislations" and have more substantive effects. Presidential memoranda and directives more often address issues that are temporary or are used to instruct agency officials to take specified action in accordance with established regulatory or departmental processes.⁹³

Another weakness of presidential directives for human experimentation protections: they are subject to the political leanings of the president in power at the time. A 1994 *Bulletin of Atomic Scientists* article explained:

Many people have wondered why these events [human radiation experiments] were not revealed earlier. But most of the facts of human experimentation were known. There have

been a number of attempts to tell parts of the story. Local newspapers, such as the Knoxville Journal, told parts of it, as did national papers such as the Washington Post and the New York Times. Cong. Edward Markey of Massachusetts and his staff conducted an investigation into many of the human experiments and published their findings in 1986. At the time, Markey called on the Energy Department to find the victims, assess their health status, and compensate them. But none of the earlier revelations shook the conscience of the country the way Hazel O'Leary's announcement did. It was a propitious time and platform.⁹⁴

President Reagan favored secrecy and national security and would not investigate radiation experiments in 1986 while President Clinton supported an investigation into the radiation experiments in the 1990s and even publicly apologized to some of the victims, a first for cold war experiment victims.⁹⁵ But President Clinton's waiver of informed consent for military expediency is just one example of national security priorities that continue to arise, one of many clear demonstrations that executive memorandums and orders on experimentation law, as in the past, continue to be ineffective. Clinton, as a lawyer could be considered disingenuous in his 1997 presidential memorandum on *Protections for Human Subjects of Classified Research*, as seen in the above described weaknesses of an executive memorandum, although he has done more for human subject protections than any president so far.

Experimentation law, national security law and congressional powers

A succinct analysis of national security as it relates to the separation of congressional and presidential powers and experimentation law for secret experiments, an intelligence matter, is described as follows.

The Church Committee, organized in the mid-1970s to investigate intelligence activities, argued that intelligence should be governed by both Congress and the president with the same system of checks and balances that applied to any other policy area. . . . In practice, however, the constitutional elements of the debate have been displaced by a consistent pattern of congressional acquiescence and presidential preemption. Congress has typically ceded the ground to the president by enacting broad statutory delegations of power and by an inability to take the initiative on intelligence matters. In a pattern at the core of executive institutional power, presidents have moved to fill in the gaps in authorizing legislation with their own interpretations, outflank congressional efforts to impose more substantive restrictions, and maintain the initiative in important policy areas.⁹⁶

This congressional/executive pattern of shared powers can be seen in the fact that no legislation on protections for human subjects of classified experiments has ever passed. The congressional hearings on MKULTRA in the 1970s led to executive orders, not legislation. Congress has passed legislation for three major programs to provide compensation to radiation victims who may have been harmed, but this only affects a small fraction of the victims. Compensation bills can be seen as a way to placate the current victims and as a result congress does not have as much pressure to make the fundamental changes to prevent illegal experiments again. *The Veteran's Dioxin and Radiation Compensation Act of 1988* "administers a program designed for veterans who were exposed to radiation with special provisions for those exposed at Hiroshima and Nagasaki and in atomic weapons tests."⁹⁷ Only 1,401 claims were approved out of 15,000 claims and in light of estimates of 200,000 soldiers exposed to nuclear bomb tests. The *Nuclear Claims Trust Fund* "was established under a 1986 agreement between the United States and the Marshall islands to compensate inhabitants of the islands exposed to radiation from US weapons testing of 67 nuclear explosions between 1967 and 1958."⁹⁸ The *Radiation Exposure Compensation Act of 1990*, "established to provide compensation to uranium miners, persons living downwind from the Nevada Test site, and veterans and civilians who received radiation at the site of atmospheric weapons tests in Nevada and the Pacific."⁹⁹ But the legislation is too restrictive and "place too low a ceiling on the amount of compensation awarded."¹⁰⁰

A 1994 *American Bar Association* article further explains the serious legal roadblocks to relief and that some enacted legislation protects contractors of atomic testing from potential liability, an indication of the clout of the defense industry and the relative weakness of human subject protections:

Radiation Exposure Compensation Act of 1990 (42 U.S.C. Section 2210) [provides a \$100 million fund] allows payment of up to \$75,000 but they cannot sue in court. Civilians dusted with radioactive fallout from Nevada testing who can show the onsets of specified terminal

afflictions within a specified periods of time can receive up to \$50,000 each under the *Radiation Compensation Act*. But they must forego all other litigation against government and private parties. Civilians in a university research project or unwittingly exposed after a nuclear blast face another obstacle. The so-called Warner Amendment (42 U.S.C. Section 2212) gives immunity to contractors involved in Nevada testing and also places limits on discovery. This statute lets the government take the place of contractors as the defendant in radiation claims. At that point, the tort-claims and *Feres* obstacles arise again. "The [radiation] cases I've worked on have been the worst PI [personal injury] cases I've ever heard," says one lawyer. The obstacles for potential plaintiffs is a virtual landslide of statutes and judicial opinions."¹⁰¹

Compensation bills have been passed by Congress in a handful of cases for compensation for damages to an individual by government experiments. In 1994, Democratic Rep. Leslie Byrne of Virginia sponsored a bill that sought \$254,488 for Air Force officer Lloyd Gamble.¹⁰² The Defense Department says in 1957, Gamble signed a "volunteer's participation agreement" and was given LSD. Gamble was told that he "would receive a chemical compound, the effects of which would be similar to those experienced from being intoxicated by alcoholic beverages."¹⁰³ Gamble suffered blackouts, depression, anxiety and violent behavior. But the Justice Department claimed the statute of limitations had expired in his case and the Veterans Administration found "no evidence of permanent injury", thus denying his disability claim.¹⁰⁴ The Department of Defense opposed the Byrne bill, saying there was "insufficient factual basis" for compensation.¹⁰⁵ This is a typical experience.

The balance of power between Congress and the President clearly favors presidential powers regarding human experimentation law. No effective statute regulates classified human experiments even as two major scandals have occurred. The analysis of national security law and presidential power provides an explanation. "This pattern of presidential initiative and flexibility stands in sharp contrast to Congress's largely ineffective attempts to enact meaningful restrictions and oversight [in intelligence matters]."¹⁰⁶

"As Eisenhower did in the 1950s, though, Ford was able to deflect the move toward a legislative charter by establishing his own investigating body (the Rockefeller Commission) and issuing his intelligence executive order, . . . "The entire exercise," writes Frank Smist, "was an attempt by the administration to prevent legislative action that would permanently inscribe congressional oversight into law. " Carter continued this pattern of presidential preemption."¹⁰⁷

A further problem as seen in both intelligence matters and human subject protections is that the executive branch does not follow the law. The CIA and radiation scientists conducted illegal experiments in spite of ethic codes and fundamental constitutional rights to the contrary, similar to the Iran-Contra scandal:

In any case, the notification and finding provisions failed to prevent the abuses that emerged from the Iran-Contra scandal.. . . the history shows how easy it was for the president and those acting on his behalf to maneuver within the congressionally imposed boundaries on the conduct of covert intelligence operations (as well as to ignore those restrictions that proved burdensome). . . . What is clear is that the executive branch had no trouble circumventing the legislative proscriptions. . . . The struggle between Congress and the executive branch over the structure and organization of the intelligence community continues, as has the pattern of presidential dominance.¹⁰⁸

The presidential appointed committee, ACHRE looked at the current status of protections in human radiation research and research generally. But interestingly, proposing model legislation was not a part of the mandate of the ACHRE. ACHRE "may recommend further policies, as needed, to ensure compliance with recommended ethical and scientific standards for human radiation experiments."¹⁰⁹ ACHRE did not recommend legislation. The ACHRE did inquire into the possibility of current illegal experiments. "We were advised that the only classified studies involving human subjects currently conducted by six federal agencies are a small number of projects sponsored by the DOD and the CIA."¹¹⁰ But there are no current mechanisms to verify this and no reason to trust the information as accurate, based on the CIA and DOD's track record for cover stories, illegal actions and lying.

The radiation experiments scandal resulted in President Clinton's 1997 executive memorandum and presidential commissions and committees and while Congress proposed congressional legislation, none passed. The executive branch's historical interest in continuing national security experiments seems to be reflected in the presidential actions of preempting congress by appointing presidential panels and issuing executive directives. In this manner, the executive branch can retain their power over national security

experimentation law and deflect stronger legislation and oversight by congress.

Recognizing that ethical rules and federal regulations are not enough, several government and influential organizations have called for legislation on human subject protections. And yet, this rhetoric is not followed by meaningful actions. In a 2002 *Boston Globe* article, Annas explains: "We need a lot more reform than the IOM (Institute of Medicine) seems to recognize. This is but another voice crying in the wilderness. All their major recommendations have been made over and over again."¹¹¹ The *Boston Globe* article continued, "The release of the report (IOM report) comes as Congress this year has failed to come to an agreement on legislation to tighten protection in human experiments."¹¹²

A 2005 Congressional Research Service (CRS) report entitled, "*Federal Protection for Human Research Subjects*" reported that "Congress has shown a keen interest in the Common Rule largely because of the federal government's long-standing investment in medical research, and its interest in research-subject safety. . . . legislation to revise the Common rule has been introduced in every Congress since 1997."¹¹³ The National Bioethics Advisory Commission, a presidential commission formed in 1995 to advise the President, issued the report, *Ethical and Policy Issues in Research Involving Human Participants*.¹¹⁴ The report stated, "This topic[human experiments] was one that led to the establishment of the [NBAC] Commission in 1995, after the report of the Advisory Committee on Human Radiation Experiments [ACHRE] made clear that oversight problems remained in conducting research with human beings."¹¹⁵

Both the 2001 NBAC and 2005 CRS reports fail to address classified experiments. And while the 2001 NBAC report provided a list of "ACHRE Recommendations Relevant to this Report," it does not mention the ACHRE's recommendations for classified research.¹¹⁶ The report details other types of waivers of consent raised by the ACHRE but does not mention the waiver for classified research covered by the ACHRE. The factors described above match the presidential/congressional pattern for dealing with intelligence and national security issues, as predicted by the national security law and presidential powers framework: a deference by Congress of their shared powers to the President.

To summarize, in light of the immediacy of the scandal of recent classified radiation experiments: the 2001 NBAC is a Presidential Commission, not congressional; NBAC did make recommendations for legislation "for a unified, comprehensive federal policy" for human experiments; some of the NBAC proposed legislation were adopted into recent legislation but no bills have passed; NBAC made no mention that Clinton's 1997 memorandum was not adopted by HHS, just adopted by the DOD; no mention of any new rules to implement ACHRE's recommendations for classified research; NBAC omitted information on the classified waiver while citing other waivers cited in the ACHRE report; the NBAC report only mentions the 1990s illegal radiation experiments scandal in passing and made no recommendations for its prevention from happening again, while at the same time, covered in depth, recent unclassified research scandals and recommended remedies.

Former Senator John Glenn of Ohio's 1997 proposed bill, *Human Research Subject Protection Act of 1997* promised to be the nation's first criminal sanctions for medical researchers who fail to obtain consent from people participating in experiments.¹¹⁷ In his speech on the proposed legislation, Glenn stated:

Specifically, the advisory committee recommended that informed consent of all human subjects of classified research be required, and that such requirement not be subject to waiver or exemption. Under current rule and executive order, it is possible to waive informed consent . . . for classified research. Title II of this legislation would prohibit the waiver of either informed consent . . . for classified research.¹¹⁸

Section 105 of the Glenn bill stated: "Any employee of a research facility that knowingly violates any provision of this act shall, on conviction thereof, shall be fined not more than \$10,000, or imprisoned not more than 3 years, or both. Such violation shall be referred by the Secretary of the United States Department of Justice for prosecution."¹¹⁹ The bill had little support, "languished", and did not pass.¹²⁰ A 1997 *New York Times* article provided some explanation for this:

The [Glenn] bill also would create criminal penalties for violators -- a provision that has drawn criticism from the Pharmaceutical Research and Manufacturers Association of America, which often finances private research. "We believe in informed consent and our companies bend over backwards when we deal with patients," said Mark Grayson, the group's spokesman. But criminal penalties were unwarranted, he said.¹²¹

Congressman Diane DeGette of Colorado has proposed three bills on experimentation, a 2000, 2002, and 2003 bill, with plans to introduce a 2004 bill, but none have passed.¹²² The 2000 *Denver Post* reported on the pharmaceutical and medical lobby's influence on the 2000 bill.

Although DeGette had lined up an impressive array of supporters, including the Association of Medical Colleges, Citizens for Responsible Care and Research and the American Diabetes Association, her "*Human Research Subject Protections Act of 2000*" did not have the immediate endorsement of either the drug industry or the American Medical Association, two major players on any health care legislation before Congress. Spokesmen for the AMA and the Pharmaceutical Research & Manufacturers of America said they had not studied the legislation. Jeff Truewhitt, the PRMA spokesman, called DeGette's legislation's goals "commendable" but added, "The devil is in the details."¹²³

DeGette's 2000 and 2003 bill included sections on classified experiments:

Certain classified Human Subject Research
Notwithstanding any other provision of law, Federal funds may not be expended for the conduct of classified human subject research if 1) the Institutional Review Board reviewing the proposal for the research pursuant to this section has under the Common Rule waived the requirement to obtain the informed consent of the human subjects in the research; or 2) the research is exempt from the requirement under the Common Rule that the proposal for the research be reviewed by such a Board.¹²⁴

The 2004 *Annals of Internal Medicine* reported on Senator Kennedy's experimentation bill, the *Research Revitalization Act of 2002*, illustrating the political hurdles in passing experimentation legislation:

However, like all previous efforts, the major hurdle has been passage; neither bill was enacted. . . and Senator Kennedy plans to reintroduce his bill in 2004. . . . With Senator Frist now the majority leader and Senator Kennedy now in the minority on the Health, Education, Labor, and Pensions Committee, legislation to protect human subjects seems to have a lower priority in the Senate.¹²⁵

Legislative attempts so far have failed dismally and the national security law and presidential powers framework supports a prediction of a strong likelihood of future experimentation scandals. Presidents have preempted Congress's ineffective attempts at legislation on human subject protections with presidential commissions and committee reports. The presidential reports describe a government policy of strong support for human subject protections but are followed by weak, incomplete and unrealistic recommendations. Presidents have implemented human subject protections, including presidential memorandums that were never promulgated and executive orders that include clauses preventing lawsuits while allowing for waivers of the consent of human research subjects and secrecy. In this way, presidents can hamper legislative attempts while advocating rhetorical support for human subject protections. This consistent response by every president so far is intended to thwart meaningful legal human subject protections or remedies. In reality, by failing to effectively address the issue even after two major scandals, presidents continue to condone the belief in illegal experiments as essential to national security. The legislative acquiescence to the president's actions and national security concerns have effectively resulted in an abysmal failure of government policy for human subject protections in national security experiments.

The need for a federal statute on human subject protections for national security experiments

The benefits of a statute rather than executive orders for human subject protections are as follows: Codifying human subject protections would ensure legal remedies not currently available for illegal classified experiments. A statute could provide for express legal rights to sue. Currently, the Common Rule does not expressly establish a private right of action for injured research subjects.¹²⁶ A statute, unlike executive orders, could not be repealed, rescinded, modified, or evaded with the next presidency.¹²⁷ A statute for enforcement of criminal penalties for researchers who fail to obtain consent would be more consistent than with the current variation of rules for the many federal agencies which have adopted the Common Rule. Past

and current executive orders provide no compensation for victims or punishments for wrongdoing, which a congressional bill normally includes. A 1998 *Boston Globe* article reported the comments of two experts who for many years, have endorse sanctions:

Some medical ethicists want such a panel to go even further, by having the authority to sanction researchers deemed to have acted unethically. "You have to have real live penalties for violating the rights of subjects -- like fines and jail," said George Annas, . . . , who plans on drafting legislation to create a board able to impose sanctions. Dr. Jay Katz, a Yale University professor emeritus of Law, Medicine, and Psychiatry who was the first to call for such a national board, agreed: "If you don't have any teeth in the regulations, that creates problems."¹²⁸

The risk that the executive branch may bypass the law and ignore a statute for experimentation law should also be considered in any future legislative efforts. The pattern of bypassing the law is not unusual in intelligence matters as shown above. The MKULTRA and radiation experiments were implemented at the highest levels of government and were known at the time to be illegal. Experimentation law experts have recommended legislation and criminal penalties. After two major scandals, the legislative and executive branches have not implemented meaningful protections or addressed criminal penalties. There was no evidence of presidential support for any legislation for human subject protections during the last fifty years, even though, as almost all legal experts would agree, legislation would provide much better protection for research subjects. A major experimentation scandal after strengthened regulations were put into place, has not occurred but government reports and experimentation law experts have called for legislative reforms for the subsequent unclassified experimentation abuses that have occurred. After fifty years of ineffective ethics codes and regulations, the need for a federal statute continues to increase.

Experimentation law-alternative approaches

The Nuremberg Code and the judicial, congressional and executive branches have been no match for the overwhelming cultural acceptance of the crisis of post cold war experiments. Much more ground work, which began with the Nuremberg Code may be the only practical alternative.

One approach is to educate the public about national security law and the lack of human subject protections. As described above, everyone can agree on this: human experimentation without voluntary consent is a clear violation of the U.S. Constitution and international human rights treaties, specifically the ICCPR and the CAT. Unconstitutional acts are not acceptable, even for national security rationales enforced by an unspoken and powerful consensus. The history of experimentation law demonstrates that cultural acceptance of experimentation law may be a necessary step towards putting effective experimentation law into practice.

Education on the ethics of experimentation law could address the victim's individual rights, which have been ignored for the most part. The consensus that consent of the human research subject is necessary in human experiments has been constant and vocal but in reality most people, by their inaction, accept the necessity and inevitability of illegal human experiments for national security purposes. A strong alternative argument against this entrenched belief system can be made. The Nazi doctors argued that they did no wrong and admitted no guilt. US researchers for the CIA MKULTRA and military radiation experiments also did not apologize for their actions and felt that national security priorities necessitated sacrificing the evils of a few human experiments for the defense of the country. This has been the accepted argument put forth in post World War II experimentation scandals. But there is a strong alternative argument for individual rights that is put forth less often. Is it worth giving up individual rights for national security concerns? The answer is clearly, no. National security rationales can be traced back to the Nuremberg Trials and can be challenged for their amoral logic. The modern history professor Ulf Schmidt wrote a 2004 book about the Nuremberg trials, the Nuremberg Code and modern ethics. He described the ethics of an alternative argument:

Human research is-or should ultimately be- a dialogue between two equal subjects, and should remain so even if this exchange causes progress to be slowed along the way. Unless we see this dialogue as an essential part of the research process, and unless we are willing to pay a certain price for this dialogue to take place, medical ethics codes and other professional regulations amount to little more than lip-service. . . . Doctors need to acknowledge that moral

codes are formulated by man and thus subject to change. At the same time, however, they should be constantly mindful that both medicine and society must always uphold certain universal principles, including respect for the inviolability of patient-citizens and the rights of the individual to self-determination.¹²⁹

Balancing this ethical approach with national security will at the least, lead to progress. As the record of abuses in past experimentation scandals have revealed, some of the past experiments could have been improved in significant ways. An under-reported but successful military program of volunteer human subjects for biological experiments also offers an alternative to unethical and illegal national security experiments.¹³⁰ While intelligence agencies may still insist on tight security for some human experiments, the volunteer approach may alleviate the huge numbers of victims seen in past cold war experiments.

National security in past experimentation scandals has been iron-clad and allowed for serious abuses. A possible alternative that addresses secrecy surrounding national security experiments was described in a 2001 book, *Secrecy Wars: National Security, Privacy, and the Public's Right to Know*. The model of the Assassination Records Review Board was a "highly successful and novel experiment in public disclosure."¹³¹ This model may allow for continuing secrecy requirements for national security while allowing for oversight, accountability and transparency in national security experiments. This is a possible mechanism to retain secrecy requirements while protecting human research subjects and could be adapted accordingly. A citizen panel appointed by the president was given full legal access to all agency records relating to the assassination of President Kennedy and 4.5 million documents were released. Professor Melanson recommends this model for areas in which:

1. There is a historic, long-running subject encompassing both old and new records over a period of many years or decades.
2. The topic is politically sensitive or contentious.
3. There is a large volume of records.
4. The regular disclosure process is not working, in terms of timeframe, reasonable release, or both (that is, too slow, too much secrecy).¹³²

According to the book, this model could include the radiation exposure of US troops during atomic testing and experimental testing of unwitting human subjects by US military and intelligence agencies. The book describes the process in detail, including that the boards should have a fixed, four-year term and need a staff component of lawyers who are expert regarding disclosure laws and the secrecy system.¹³³

The failures of past attempts to protect human subjects in national security experiments call for a more impartial, balanced examination of the ethical, cultural and political factors and their influence on experimentation law. By understanding why the failures have occurred, more realistic approaches as described above may have a much better chance for progress. Now the government has argued that cold war national security and post 9-11 conditions require increased secrecy and the sacrifice of individual rights guaranteed by the Constitution. Before accepting this argument, many lessons can be learned from the history of cold war human experimentation law within a framework of national security law and presidential powers.

"One solution to the theoretical problems faced by presidential scholars is to rely on applications of what has become known as the "new institutional economics" [NIE] as a way of organizing and explaining presidential behavior. The central questions of concern within the NIE literature are why economic institutions emerge and why they take the hierarchical form that they do. . . . rational choice institutionalism-begins with the assumption that presidents seek control over policy and process, just as rational choice theories of Congress typically assume that legislators seek reelection."

Protections For Human Subjects of Classified Experiments Still Lacking

[Mind Justice Home Page](#)

An article by Cheryl Welsh, "**Protections for human subjects of classified experiments still lacking**" was published in the December issue of a small San Francisco newspaper, North Bay Progressive, www.northbayprogressive.org and will be considered for a Project Censored Story in 2004, see below. [North Bay Progressive, December 22, 2003-January 23, 2004, Volume 2, Issue 9, Page 11.]

Project Censored

www.projectcensored.org

The Mission of Project Censored is to educate people about the role of independent journalism in a democratic society and to tell The News That Didn't Make the News and why.

Project Censored is a media research group out of Sonoma State University which tracks the news published in independent journals and newsletters. From these, Project Censored compiles an annual list of 25 news stories of social significance that have been overlooked, under-reported or self-censored by the country's major national news media.

Between 700 and 1000 stories are submitted to Project Censored each year from journalists, scholars, librarians, and concerned citizens around the world. With the help of more than 200 Sonoma State University faculty, students, and community members, Project Censored reviews the story submissions for coverage, content, reliability of sources and national significance. The university community selects 25 stories to submit to the Project Censored panel of judges who then rank them in order of importance. Current or previous national judges include: Noam Chomsky, Susan Faludi, George Gerbner, Sut Jhally, Frances Moore Lappe, Norman Solomon, Michael Parenti, Herbert I. Schiller, Barbara Seaman, Erna Smith, Mike Wallace and Howard Zinn. All 25 stories are featured in the yearbook, Censored: The News That Didn't Make the News.

In 1996 and 1997, the yearbook won the Firecracker Alternative Book Award, celebrating the best in alternative publishing. The release of Project Censored's yearbook has developed into a national alternative press event. In 2003, along with several independent national magazines, over 40 alternative newsweeklies carried the Top 10 Censored stories in metropolitan areas throughout the country, and Project Censored was featured on more than 125 independent talk radio and television shows. Throughout the next year and into the next decade, Project Censored will continue to inform the public, advocate for independent journalism, and strive to spark debate on current issues involving media monopoly.

Project Censored is a national research effort launched in 1976 by Dr. Carl Jensen, professor emeritus of Communications Studies at Sonoma State University. Upon Jensen's retirement in 1996, leadership of the project was passed to associate professor of sociology and media research specialist, Dr. Peter Phillips.

Protections for human subjects of classified experiments still lacking

By Cheryl Welsh

(11-10-03) Ten years have passed since unethical radiation experiments were publicly revealed in 1990s front page news and the Office for Human Subject Research, OHRP, recently confirmed that there have been no changes in federal regulations on human subjects of classified research since then. In 1995 the

Advisory Committee on Human Radiation Experiments, (ACHRE) reported that the federal government was "blameworthy for not having had policies and practices in place to protect the rights and interests of human subjects" in several thousand experiments. President Clinton adopted one of the ACHRE recommendations in a 1997 presidential memorandum requesting that federal agencies modify their policy governing classified research. A 1998 Department of Health and Human Services (DHHS) proposed rule on the Clinton memorandum has stalled and secret unethical experimentation could happen again.

This is the second time a major scandal involving human experiments for national security purposes has occurred. Past military and CIA experiments with toxic chemicals and for behavior modification were headline news in the 1970s. Congressional hearings uncovered illegal and extensive government programs including the CIA's now infamous MKULTRA mind control experiments. As a result, a series of presidential executive orders were implemented.

President Reagan's 1981 executive order, E.O. 12333, is the only current law governing classified experiments by intelligence agencies. Legal experts say it is unenforceable for several reasons, one being that a provision of the executive order states, "Nothing contained herein or in any procedures promulgated hereunder is intended to confer any substantive or procedural right or privilege on any person or organization."

Federal regulations are ineffective

Adopted by 17 federal agencies, the current regulations on experiments are called "The Common Rule". The rules cover both classified and unclassified experiments and include the cornerstone of human experimentation law, informed consent of the research subject. But experts agree the regulations lack any mechanisms for how classified research can be reviewed and conducted with informed consent.

Efforts to adopt a regulation on classified research have failed. A new draft regulation has been circulated but its current status could not be confirmed. Some experts say US national security policy on weapons development is the main reason for the lack of effective protections for human subjects of classified experiments.

9-11 secrecy law increases risk of unethical experiments

"It borders on the scandalous that we still don't have rules in place that would at least begin to protect the people who are in those trials," warned Jonathan D. Moreno in a 2002 news account. Dr. Moreno, a University of Virginia ethicist reported that President Bush had given the Secretary of Health and Human Services [HHS] the authority to classify information as secret. Moreno said "that could allow the Defense Department or CIA to undertake secret human experiments with the HHS."

Dr. Andrew Goliszek, author of the 2003 book, *History of Secret Programs, Medical Research, and Human Experimentation* warned, "While there is much debate, there are no clear guidelines or legislation that would prevent the government from conducting secret research in order to stay one step ahead of terrorists who would use bio weapons against us."

Proposed legislation fails

Fred Allingham is executive director of the National Association of Radiation Survivors, NARS, a network of 11,000 radiation survivors. Allingham recently described NARS legislative work. "Five to eight years ago, our members brought a proposed Nuclear Ethics Law to their local congresspeople (over 200) asking them to sponsor such a piece of legislation in order to make it not only a civil wrong but a criminal wrong, to expose people to radiation deliberately for experimental purposes... Not one congressman touched it. We ... decided we are going to try again."

Former Senator Glenn of Ohio described his 1997 bill as "the nation's first criminal sanctions for medical researchers who fail to obtain consent from people participating in experiments." The bill did not pass. Congressman Diane DeGette of Colorado will reintroduce her 2002 bill on experimentation very soon, her office reported last week.

No national statute on protections for human subjects of classified experimentation that would help to

prevent national security experiments like the radiation or mind control experiments has passed.

Lack of justice in the courts

Lawyers of radiation and mind control experiments litigation describe a nightmare of legal hurdles. Courts give great deference to national security and the government is immune to many types of lawsuits. While the government admitted to wrongdoing, not one government official or researcher involved in mind control or radiation experiments has been punished.

A 1994 US News account reported few victims of the drug and behavior control experiments were told what was done to them and most were never compensated. Radiation victims report a similar tragedy. A huge number are not eligible for the available legislative compensation because of extremely demanding requirements.

No change in sight

Commenting on the total lack of legal protections, law professor Alan Schefflin stated, "The message to scientists and governments around the world is that you can get away with unlawful experiments on unwitting victims with impunity." New classified weapons comparable to the atomic bomb have actually been in development for a long time and classified, unethical human experiments are inevitable, without major changes.

Coping with the Weapons of Tomorrow, a 2003 International Committee of the Red Cross (ICRC) conference featured a discussion of concerns about new nonlethal weapons using electromagnetic energy. A disarmament expert read from the 1975 Geneva protocol treaty debates about the then-future weapons including, "...geophysical, ecological, electronic and radiological warfare as well as devices generating radiation, microwaves, infrasonic waves, light flashes and laser beams".

According to Dr. Colin Ross, author of *Project Bluebird*, on CIA experiments, new nonlethal weapons "are beamed at individuals in order to control them." Dr. Ross predicted, "It is implausible that there hasn't been some clandestine experiments of nonlethal weapons on individuals today."

Table of Contents

In memory of two victims who have died fighting:
Paul Schaefer and Carol Sterling

[Introduction](#)

- A note of [gratitude](#)
- About [Cahra](#)
- About the [author](#)
- In [memory](#) of two victims who have died fighting:
[Paul Schaefer](#)
[Carol Sterling](#)

[Chapter 1. The Victims](#)

- [Who](#) are victims of electromagnetic nonconsensual experimentation?
- [Victim claims](#) with comparisons to unclassified information
- [Microwave hearing](#) : Government documents reveal history of an intelligence tool
- [Frequently asked question](#): How can one person hear microwave hearing while a person nearby cannot?
- [Victims describe](#) more symptoms with comparisons to science and military articles
- [In addition](#) to experimentation, it is a surveillance and political weapon and victims report being systematically discredited
- [How many](#) victims allege electromagnetic targeting?
- [Russian](#) groups similar to Cahra, with over 1,000 alleged Russian mind control victims
- [An explanation](#): making the connection between cold war mentality and victim's allegations
- [Sloppy vs. accurate](#) news coverage: get the facts
- [The medical](#) and psychiatric community's response to victim's claims
- [Mental illness](#): the government's cover story for illegal experimentation
- [Example](#): Army document, low power microwaves

[Chapter 2. Why are victims targeted?](#)

Chapter 3. Scientists and victims claim same warnings and predictions

- [Section 1](#). Victim stereo-type
- [Section 2](#). Top scientists warn of mind control technology
- [Predictions](#) of future technology

Chapter 4. Human Experimentation

- [The history](#) of government illegal experimentation: No codification of the Nuremberg Code or penalties under U.S. law
- [Ethicists](#) predict future illegal experimentation
- [Universal behavior](#): Rationalization of inhumane experimentation and lack of remorse by scientists is universal
- [1994](#) U.S. illegal experiments in other countries
- [How illegal experiments](#) can happen now
- [Unregulated](#), unethical corporate experimentation today
- [Example](#): [London] Times Article - Allies' Nazi-style tests

Chapter 5. National security law

- [National security](#) law: the underlying problem, why victims are not getting help
- [Tightly controlled](#) information: the public can't even find out if a scientist is conducting classified research
- [No whistleblowers](#) in national security issues
- [The underlying problem](#): A classified electromagnetic arms race
- [1989](#) break up of the Soviet Union: major international incident led to exposure of 'mind control' weapons

Chapter 6. Victims have problems with bureaucracies

Congress, the judicial system, the executive branch, human rights groups: band aid help but no solution

- [Intelligence Committee behavior](#) from the 1970s to the 1990s: a decline
- [Intelligence Committees](#) of the 1970s
- [Ongoing problems](#) of the intelligence committees
- [National Security](#) vs. democratic principles: the special dilemma of intelligence Committees
- [Identifying the problems](#) of the intelligence committees
- [Possible solutions](#)
- [Congressional intelligence](#) committees in the 1990s
- [Footnotes](#)
- [The Executive branch](#): why there is a negative response to this issue
- [How the legal system operates](#): political influence at the Supreme Court level
- [Human rights groups](#) will not touch this issue: no political will

Chapter 7. Electromagnetic technologies and national politics

- [The Cold War](#) is over. What will the U.S. do?
- [Corporate control](#) of electromagnetic technology
- [Military cooperation](#) with civilian law enforcement agencies: bureaucratic entanglement
- [No political will](#) to declassify electromagnetic mind control technology
- [Secrecy and billions](#) of pentagon dollars

Chapter 8. Electromagnetic technologies and international politics

- [Not one person](#), even the most powerful, can stop it
- [Missed opportunity](#) for one world government
- [Classified](#) electromagnetic arms race is over: U.S. won.
- [No political hot potato](#): world opinion does not significantly influence the U.S.
- [The United State's position](#) in the human rights community: a powerful force
- [Comparisons](#) to the atomic bomb and biological weapons: a probable pattern of development and use
- [Electromagnetic technology](#), like the atomic bomb, is controlled by the government but has close ties with corporations and private enterprise
- [International science](#): the same national government and corporation scientists make international policy
- [A case study](#): the Moscow Signal, microwave zapping of the U.S. Embassy

[Chapter 9. Electromagnetic technology](#)

- [New articles](#) on the technology
- [History](#) of the development of Russian electromagnetic research

[Chapter 10. The history and scientific basis of mind control technology: more facts to support the theory that the key to consciousness has been discovered](#)

- [World class scientists](#) form 1950s biology-physics groups: the Jasons, the phage group, Biophysical Society, Cybernetics Group and Teleological Society
- [MIT, Massachusetts Institute of Technology](#): a possible classified electromagnetic weapon technology location similar to the Manhattan Project's, University of Chicago football field location
- [Possible scientific basis](#) for the key to consciousness
- [Russia & East Block](#) say nonthermal emr biological effects proven, U.S. says no
- [Medical community](#)'s use of nothermal electromagnetic radiation effects
- [Example](#): We're All Radio Stations

[Chapter 11. Progress](#)

1. [Beginning](#) with the CWC or chemical weapons convention, reported by Barbara Hatch Rosenberg in Bulletin of Atomic Scientist Sept./Oct 1994 p. 45, stated that under "The Certain Conventional Weapons Convention (also known as the Inhumane Weapons Convention and by its full name, "Convention on Prohibition or Restriction of the use of Certain Conventional Weapons Which May Be Deemed to Be Excessively Injurious or to Have Indiscriminate Effects", international discussions are now under way that may lead to the development of a specific new protocols covering electromagnetic weapons;.
2. [The European Parliament](#) Resolution A4-005/99, environment, security and foreign policy passed on Jan 29, 1999. Item 27 is as follows. "Calls for international convention introducing a global ban on all developments and deployments of weapons which might enable any form of manipulation of human beings."
3. [Electromagnetic](#) Weapons Summary: by Grattan Healy, Advisor on Energy & Research Green Group in the European Parliament: February '99
4. [There are steps](#) forward and back, Dec/Jan 97/98 Nexus, p8 stated that "On 19 November 1996 something happened in Strasbourg, France, which could fundamentally remove many of the rights of patients. It had no public airing beforehand, and has been little reported on ever since. **After marathon discussions, the Committee of Ministers of 39 European Union member states adopted the Convention on Human Rights and Biomedicine. This allows for future drug use and other medical trials to be carried out on potentially huge numbers of people, possibly without their consent.**
5. [The United Nations](#) General Assembly has adopted this 1996 Resolution 51/37. Prohibition of the development and manufacture of new types of weapons of mass destruction and new system of such weapons.
6. [International](#) Committee for the Convention Against Offensive Microwave Weapons 1998 Civil Court Case Dismissed and Appealed to the Inter-American Commission on Human Rights
7. [World Organization](#) Against Torture. An official 1998 recommendation to conduct "a thorough and

impartial investigation into involuntary human experimentation involving new forms of classified research and testing of high technology military weaponry including microwave and laser equipment"

8. [The International](#) Bioethics Committee IBC of UNESCO, Proceedings of the Third Session September 1995, Volume1 included the conclusion to chapter 1 entitled "Ethics and Neurosciences" by Jean-Didier Vincent, Director of the Alfred-Fessard Institute, ".As a possible instrument of encroachment on human liberty and dignity, the neurosciences may also turn out to be a poisoned chalice on which the worst forms of ideology may thrive. The purpose of this report is to examine in a clear-sighted way and without complacency, the hopes and risks involved and to issue a few warnings of an ethical nature."
9. [The medical profession](#) and the effects of weapons, Excerpts and recommendations from the Reports of the Symposium held under the auspices of the International Committee of the Red Cross Montreux, Switzerland, 8-10 March 1996.
10. [Russian](#) State Duma Expert Yuriy Lopatin Calling for Legislation Banning Illegal Development and Sale of Mind-Control Devices Excerpt from the "Man and Law Program, Moscow Russian Public Television First Channel Network in Russina 1610 GMT 6 Oct 95.

[Chapter 12. Strategies for victims: fighting back](#)

1. [There](#) is no solution but many approaches towards the goal.
2. [Information](#) the public needs to know.
3. [Research](#) and collecting information is important
4. [One person](#) makes a big difference: milestone for the cause
5. [Political](#), financial and international pressure, an important tool to be developed
6. [What can be done](#) about the media problem
7. [Working](#) on a legal solution
8. A [grassroots](#) campaign; one avenue of many that victims can effectively work on in their search for an end to nonconsensual experimentation. There are massive problems. Government harassment and problems with secrecy.
9. [Harassment](#) used to suppress information from the public
10. [Networking](#) with other grassroots organizations
11. [Innovation](#): in the end, victims must try anything that might work and is realistic
12. [The approximately](#) 500 victims who have contacted CAHRA have advice on how to survive this experience

[Chapter 13. Conclusion: Main points and brief editorial comments](#)

- [World-wide](#), victims describe the same set of symptoms: say torture is hi-tech , worse than ever
- [Technology](#) has advanced but human behavior has not kept pace
- [Human rights](#) abuse in the United States: a fifty year cold war secret
- [National security law](#): numerous professionals say it is used to hide crime, corruption and horrific human rights abuse
- [U.S. government](#) motive: a bloodless weapon, better than the atomic bomb, experts say
- [A story](#) of oppression: exploiting victims and billions of dollars in profits
- [Decoding](#) the brain: top scientists tied to government and intelligence agencies worked on classified science
- [A 50 year clash](#): The self-serving U.S. position, no proven nonthermal electromagnetic health effects Vs the Russian and East Block position, a scientifically accepted fact
- [Unclassified](#) electromagnetic technology
- [The key](#) to consciousness: a military secret
- [A global viewpoint](#)
- [Progress](#): victim's plans for the future
- [International justice](#): with hard work and strategic planning
- [A final editorial opinion](#)

[Contents](#) | [Top](#)

Introduction

Please note that this book is solely the opinion of Cheryl Welsh and it is not necessarily the opinion of Citizens Against Human Rights Abuse. This book reflects the lessons and progress in the last two years of networking and research. I am posting it, hoping that it will save others the time and money I spent. I hope that investigative reporters will investigate the many leads.

The U.S. government maintains a massive, fifty year old cold war, highly classified electromagnetic weapons program and there are allegations of current illegal experimentation similar to radiation experiments. Here are the facts given by the U.S. government officials. In stark contrast, the concerns and opinions about electromagnetic weapons and alleged illegal experiments are given by human rights professionals, medical doctors, scientists and the growing numbers of victims of alleged nonconsensual experimentation. The table of contents and conclusion section provide a summary of the 130 + pages.

This book is about an international campaign to end human rights violations using classified new weapons of mass destruction based on electromagnetic and neurological technologies. There will be examples to describe who, what when, where and why of this campaign, for example, **1986, January 21. Press Conference on Gorbachev's Nuclear Arms Elimination Proposals.** BBC Summary of World Broadcasts. Tass for abroad. Part1 The USSR; A. International Affairs; 1.General and Western Affairs;SU/8162/A1/1. Lexis-Nexis.

"Weapons based on new physical principles would include, amongst

others, means in which physical principles which have not been used hitherto are used to strike at personnel, military equipment and objectives. Amongst weapons of this kind one might include **beam, radio-wave, infrasonic,** geophysical and genetic weapons. In their strike characteristics **these types of weapons might be no less dangerous than mass strike weapons.** The Soviet Union considers it necessary to establish a ban on the development of arms of this kind. The Soviet Union has not carried out, nor does it intend to carry out either tests of such arms, or -even less so - the deployment of them. It will seek to ensure that all other countries do not do so either."

This book will define a classified human rights issue to be compared with the Holocaust. Electromagnetic and neurological technologies are being developed and are on line, for political and military use. The technology is currently being used in programs of nonconsensual human experimentation, in domestic and foreign intelligence projects and for military action. UN documentation and more verifies a 50 year U.S. cold war cover story. This book concentrates on nonconsensual experimentation.

A note of gratitude

I want to thank all of my fellow research and networkers for many of the articles quoted in this paper, especially Harlan Girard, of the International Committee Against Offensive Microwave Weapons, who has a gift for recruiting professionals to this issue and for gathering the relevant and prolific evidence in support of our cause on an international level. He is truly a hero to the cause and can take credit for the formation of this movement. Harlan Girard is responsible for much of the progress made toward an end to the ongoing human rights abuses using classified electromagnetic technologies.

About Cahra.

Citizens Against Human Rights Abuse is a 501(c)3 nonprofit organization formed in 1996. CAHRA's international membership of nonconsensual experiment victims has been growing phenomenally ever since. Donations are tax exempt and appreciated. Thanks to your generosity, CAHRA is sponsoring the Dr. Bertell Preliminary Study.

About the author

Cheryl Welsh is a law student in Sacramento, California. She received an AA degree in math and science and then worked for ten years as a medical receptionist. In 1987, she went back to school at University of California, Davis and received a bachelors in physical education. She had a very average life until she became a victim of nonconsensual experimentation in 1987. Since then she has changed her life in order to stop this torture. She now has a second bachelors in government from California State University, Sacramento and has started a nonprofit research and education organization, Citizens Against Human Rights Abuse (CAHRA) in 1996

In memory of two victims who have died fighting: Paul Schaefer and Carol Sterling

Paul Schaefer

1946-1999, a tireless activist against mind control. He wrote articles for his local paper and networked for years with many victims. He graduated with an electrical engineering degree from the University of Missouri at Rolla and had four years of experience working on nuclear weapons components at Bendix before he became an environmental activist in the 70s. Paul passed away from complications of cancer. This is an article in the Kansas City Pitch Weekly, April 13-19, 1995, "Ex-engineer Against Adverse Energy" by Mike Taylor.

Some people say prayers before they start eating a meal. On a cold night at Nichols Lunch, Paul Schaefer pulled a white plastic cone and paint-less wooden ball on a piece of string from his blue windbreaker. He dangled the contraption over a plastic basket of fried shrimp and french fries. The pendulum swung counterclockwise, as he pointed out, which it shouldn't do in the northern hemisphere. Schaefer dunked the pendulum in a glass of water. After he pulled it out, he hung it over the food again. The contraption rotated clockwise. He said, "I observed water-in addition to cleaning off germs-is a good way to diffuse adverse energy. Water and earth help control the effects of adverse beams and substances." When Schaefer walked into Nichols, he wore headphones under a red, white and blue mesh baseball cap. When asked what he was listening to, he said "I don't know what station it is. I'm listening to the high end of the FM spectrum. I'm using radio waves to pump energy into my ears." Schaefer worries about 'adverse energy,' even though his bearded face always seems to be on the verge of a grin. "There are energies beyond heat and light," he said, "The electromagnetic spectrum didn't exist until we created it. All of these things are outside the popular belief of what our environmental problems are." The fiftyish handyman with an engineering degree from the University of Missouri at Rolla and four years of experience working on nuclear weapons components at Bendix, now Allied Signal, became an environmental activist in the 70s. He played an active role in fighting against and delaying the construction of the Wolf Creek Nuclear Plant in Burlington, KS, through a group called the Natural Guard. Schaefer still concerns himself with the belief that the human race is destroying itself and the world with it, but he has focused more now on what could best be called the 'extrasensory environment.' A frequent 'letter to the editor' contributor, Schaefer wrote to the Pitch Weekly (March 24, 1994): "Now that flame-throwers and tanks are losing popularity, a kinder gentler process might be used on politically incorrect individuals such as employing a beam(s) to extract bio-energy from the space, where they are located, and causing their (people's) health to decline." He wears what he calls an "environmental flak jacket" to protect himself from the adverse energies. It's not just a piece of clothing. Black straps hold plastic tubes filled with liquid crystal are connected to coils, wires and a low frequency vibrator. Schaefer powers the contraption with batteries he carries in two cloth pouches on his hips. He said he thought the unseen forces mainly attacked his aura. Schaefer said, "Auras show our connection to everything. They can be used to facilitate preventative medicine." Schaefer thinks auras, which he said are as unique to each individual as fingerprints or DNA, can provide advances in psychological counseling as well as preventive medicine. "In his last interview, (Frank) Zappa said he didn't feel good, but doctors couldn't help him," said Schaefer. "If he'd had his aura read, he might have been able to avoid the illness that eventually overtook him." Most people wouldn't wear something like his flak jacket said Schaefer. "(But) I live in a more adverse environment than most people." **He cites numerous examples of occasions when "adverse energies," 'beams' or 'substances' have been 'shot' at him. "A neighbor called me over to her porch one day, to tell me she'd seen a beam of light come out of the sky and shoot into**

one of my windows," said Schaefer. "I could see the path through the garden where the leaves turned yellow." He told of being in a small town Missouri church with his mother on Easter Sunday, "Somebody (the government, I presume) turned a beam on us. I felt it and braced myself. My mother shrunk way down in the pew and it destroyed her hearing aid." He said the energies, beams or substances had been used in his house and car also. He said that last winter the motion sensors in front of his house operated all the time without apparent reason. Schaefer noticed the problem stopped around Easter. When asked what government agencies are attacking him, Schaefer said, "As far as I can tell, the Air Force, Army, Department of Defense, Justice Department, Department of Energy." **when asked why they want to attack him, he said it was because of his radical activities and writings.** When asked if he'd investigated and tried to find proof, Schaefer said he's been met with 'plausible deniability.' But he said, "There seems to be evidence they have this technology." Schaefer has cited the Pentagon's HAARP project-High Frequency Active Auroral Research Project-by the Navy and Air Force as proof of the government's involvement in electromagnetic energy research and manipulation. (HAARP was listed as one of Project Censored's Top Ten Censored Stories of 1994.) "I sent a letter to (US Senator from Missouri) Kit Bond," Schaefer said. "Bond asked for more information and then never answered after that. When you don't hear from them, that means they know." Schaefer added that the FBI would not take a report. After eating the shrimp and fries in Nichols, Schaefer demonstrated the "adverse energies" affecting his car, in the parking lot. He held the pendulum over the rear bumper of his beat-up 7-something fastback Mustang. the contraption rotated counterclockwise, just as it had in the restaurant. Then he held the pendulum over the bumper of a green garbage truck and it swung clockwise. For Paul Schaefer the proof of adverse energy is all around.

Here are excerpts from the **International Review of the Red Cross 279, 1, Nov. 1990 entitled "The Development of New Antipersonnel Weapons by Louise Doswald-Beck and Gerald C. Caudeyay.** In comparing Paul Schaefer's account to the weapons described in the article, a picture emerges. Paul's account of targeting by government beam weapons because he was an activist becomes very plausible. Of course Paul would never be able to prove targeting of **classified** electromagnetic weapons.

5. Directed Energy Weapons. **Research work in this field has been carried out in almost all industrialized countries, and especially by the great powers, with a view to using these phenomena for anti-materiel or anti-personnel purposes.** .It is possible today to generate a very powerful microwave pulse (e.g., between 150 and 3,000 megahertz), with an energy level of several hundreds of megawatts. **Using specially adapted antenna systems, these generators could in principle transmit over hundreds of metres** sufficient energy to cook a meal. However, it is important to mention that the lethal or incapacitating effects which can be expected from weapons systems using this technology can be produced with much lower energy levels. Using the principle of magnetic field concentration, which permits the control of the geometry on the target, by means of antenna systems especially designed for the purpose, the radiated energy can be concentrated on very small surfaces of the human body, for example the base of the brain where relatively low energy can produce lethal effects. **In spite of the rarity of publications on this subject, and the fact that it is usually strictly classified information, research undertaken in this field seems to have demonstrated that very small amounts of electromagnetic radiation could appreciably alter the functions of living cells.** Research work has also revealed that pathological effects close to those induced by highly toxic substances could be produced by electromagnetic radiation even at very low power, especially those using a pulse shape containing a large number of different frequencies. **Some research seem to have confirmed that lo-level electromagnetic fields, modulated to be similar to normal brainwaves, could seriously affect brain function.** Experiments with pulsed magnetic fields carried out in animals have reportedly produced specific effects such as inducing sleep and triggering anxiety or aggressiveness, depending on the modulation of the frequency used. It is, on the other hand, well known that lethal effects can also be produced by using higher power levels than those used for the experiments on behaviour modification. **An anti-personnel weapon based on such biophysical principles could produce similar effects to those of a nerve gas, but would have no secondary effects and leave no lasting trace.**

Carole Sterling

Carole committed suicide in order to escape the torture of electromagnetic technology. Here is an article in The Star Beacon, October 1996 page 2 by Carole.

Incident at Mesquite, Nevada conference Dear Star Beacon, I am writing about something that happened to me which goes back to December 1995. I went to a conference in Nevada. The day following the last night at the conference, I noticed that I had an injection mark on the base of my spine which was sore. Then the nightmare started three days after my return to Washington, DC An irregular pulsing and humming sound- which at first seemed impossible to tell what direction it came from- it seemed louder when I was lying down, **was crushing me with pain.** The oppression was unbearable; shockwaves, like a beating, were particularly painful in the head and in the areas where I had scars or surgery. It reverberated in those areas as well as in the area just behind the ears (the mastoid bone area, filled with air pockets). **It totally scrambled my brain,** leaving me unable to think properly, simply functioning on sheer shock and horror, with total incomprehension of what was going on. It actually was debilitating. The room felt like a torture chamber. This forced me out of my home. I desperately went to my relatives' home five blocks away. This began in their home, too. As I lay down trying to sleep, I heard two sharp cracking sounds on the television set and the same thing started again. This time I was better able to notice that whatever this was it was primarily directed to the left side of my head. The effects were so intense. My flesh felt as if it were being kneaded like dough; the glands under my chin were excruciatingly painful, as was the area next to the knees where I had scars. When I moved to the other room this started again after a few minutes; the two cracking pops on the television glass, followed by the excruciating pain. As I said, this seemed to be zeroing in on the left side of my head. What I did- maybe too late- was shield my head as best I could with aluminum wrap, which I could hear cracking like popcorn in a microwave. The intensity of this horrifying experience lasted for three days. It followed me like radar, zeroing in on me, to two other friends' home a few miles away, where I had gone to because I was trying to get away to avoid the pain. Since then, I have felt extremely ill with recurring excruciating symptoms every day. **The left part of my brain is where these symptoms seem to be localized.** However, nothing has shown up on an MRI or EEG. I believe that the technology used, be it **some type of a frequency assault**, some sort of directed energy, in addition to whatever was injected in me, has caused damage to my brain. [I have] been living with this debilitating and excruciating pain for the last eight months so far. The pain, which feels like an extremely sharp sciatic pain localized in the left side of the brain, is accompanied by stupor, memory loss. My brain feels scrambled, at times far worse than at other times. The only improvement is that my hands, which were quite numb and stiff, are back to normal as of two weeks ago. **Needless to say, this is something I no longer discuss with some family members or doctors, as they think it is so far-fetched, they just do not believe me.** Only very few people do I discuss this with. Writing this has been an effort of sheer will, at a time-usually the early hours of the day-when the symptoms are not as severe. I am trying to get better physically and get rid of the pain, hoping that somewhere there are individuals who are familiar with this kind of technology and can help me. Carole Sterling.

The comparisons of Carole's experience to the effects which electromagnetic weapons are designed to produce are similar. Dr. Barbara Hatch Rosenberg wrote in Sept/Oct 1994 Bulletin of Atomic Scientists, page 45, "Many of the non-lethal weapons under consideration utilize infrasound or electromagnetic energy (including lasers, microwave, or radio-frequency radiation, or visible light pulsed at brain-wave frequency) for their effects. **These weapons are said to cause temporary or permanent blinding, interference with mental processes, modification of behavior and emotional response, seizures, severe pain, dizziness, nausea and diarrhea, or disruption of internal organ functions in various other ways.**"

Chapter 1. The Victims

Who are victims of electromagnetic nonconsensual experimentation?

In the eyes of the general public, nonconsensual experimentation has been a non-issue, an issue that comes and goes and that the public knows little about. While most agree with the Universal Declaration of

Human Rights, adopted in 1948, which states that "All human beings are born free and equal in dignity and rights", in practice victims of human experiments without their consent have lost their rights in the United States. There has been the Tuskegee syphilis experiments, conducted by the U.S. National Institutes of Health and radiation experiments by the U.S. Atomic Energy Commission. Recently, President Clinton stated publicly that he was sorry that the Tuskegee experiments took place. Forty years have passed before the U.S. government admitted to the classified radiation experiments, although victims had tried to bring the issue into the public arena. **Now there are allegations of nonconsensual classified experiments involving new electromagnetic technologies.**

There have been victim reports as early as 1955. Like most illegal experiment programs, powerless people have been targeted. The use and development of the technology in experimentation began with scattered cases in prisons and hospitals, on street people and mental patients, political enemies of the state and on foreigners in the 1950s and 60s. By the 1990s, middleclass people and also professionals who are victims from most countries of the world are coming forward with stories of torture, mainly from the United States and Russia. Some cases include children. Victims say that the experimenters have no morals.

Victims report the control of the behaviors of groups of people, indicating a computer-radar system. The above description may sound far-fetched but less so within the context of this book. The U.S. News and World Report, Jan 24, 1994, p. 34 article entitled "Cold War Experiments" is an excellent overview of US government experimentation. Recently, there have been reports of Cold War radiation and sterilization experiments in Norway supported by the U.S. and Norwegian government from the 1940s-1990s reported by the London Times, 4-29-98 entitled, "US and Norway Used Insane for Nazi-style Tests".

Victims state the goal of the targeting is to destroy them, physically, mentally, professionally and on a personal level, to drive them to violence or suicide. The victims report debilitating, extremely disruptive and severe tactics along with the physical and mental harassment twenty-four hours a day, **anywhere in the world**, for years on end.

[Contents](#) | [Top](#)

Victim claims with comparisons to unclassified technology

- **Briefly, electromagnetic technology works on the theory that the mind and body are an electromagnetically mediated biophysics system and the electromagnetic signals from outside sources can mimic the mind and body's electromagnetic signals and therefore a weapon can be developed based on these principles.** There is evidence that since the 1950s, the U.S. and other governments have been developing electromagnetic weapons which can remotely target the electromagnetic system of the human body for military and intelligence purposes. I have posted extensive reliable documentation on my website at www.calweb.com/~welsh [now mindjustice.org].
- This is a bullet to mark descriptions of victim's symptoms
- The technology causes pain and can incapacitate the victim. Victims report very serious symptoms such as on, off control of pain in any nerve of the body, total control of body functions such as manipulation of breathing and heart beats, including heart stoppage and severe pain. Many victims report dream manipulation, memory input and control, subliminal control, visual hallucinations, holograms, hearing distortions, sense of touch distortions, microwave burns, involuntary muscle movement, voice and speech input, control of emotions and personality overlay. Victims report heat sensations to different organs of the body. Most report sleep deprivation and technology that can see what the victim is seeing in real time.
- There is a clearer picture of the problem now that victims are steadily coming forward. Over and over, they report physical pain, **microwave burns**, sleep deprivation and microwave hearing or voices of threats and abuse 24 hrs a day.

L.J. West, **a CIA psychiatrist** who died in Jan. 1999 (see previous Cahra article on US Human Rights Abuse) worked on studies of brainwashing to determine why American prisoners of war falsely confessed to engaging in germ warfare in the 1950s. **West determined that guilt could be instilled by solitary confinement and prolonged sleeplessness as well as by physical abuse.** He explained the behavior of cult members and kidnapping victims, **as the product of the three Ds-debility, dread and dependency.** A

prisoner is debilitated by inactivity, by sleep loss and filled with dread by constant threats of pain or death or harm to his family. He is rendered completely dependent upon his captors for information, food, shelter and life.

As a comparison, here are a few articles discussing current technology. This describes military goals in psychological warfare and matches the total devastation of victims lives by this technology. Defense News 9-14-20-98 p1, the subtitle is "Mobile Bedlam Brigades would sow broad chaos, confusion". It stated **"Essentially, the concept's aim 'is to control the will and perception of adversaries, from privates to princelings, by applying a regime of shock and awe,' group member Harlan Ullman, said Sept 9. "It is about effecting behavior."**

IEEE Almanack, April 2000 page 3 lists Dr. Don H. Johnson, he earned electrical engineering degrees from MIT and is conducting research on "how the brain processes sound and light." And in Intersections by the New York Academy of Sciences, April 2000, an article is entitled, "From the Decade of the Brain to the Decade of the Mind." The article stated, "Considerable progress has been made in elucidating the brain pathways involved in detecting and responding to threatening stimuli, and learning about novel threats. **The mechanisms of emotion and emotional memory within the domain of fear are emerging as a paradigmatic example of a well-characterized function of the brain.**"

"Supercomputing in Brain Research: From Tomography to Neural Networks, edited by J.H. Hermann et al. is an example of the extensive use of computers in brain research. Both corporate and government researchers are interested in **the fundamental cutting edge scientific questions** as the following article will demonstrate. Approaching the 21st Century: Opportunities for NIMH Neuroscience Research The National Advisory Mental Health Council report to Congress on the Decade of the Brain", Jan. 1988 by USHHS. It listed 50 Important Questions to Answer in the Decade Ahead; Here is a sample. 6. **How are memories encoded, stored and retrieved?** 9. How can we create functional connections between artificial microcircuits and the nervous system? 28. **What essential properties of the brain give rise to conscious awareness?** 30. **What is the function of sleep, and how is it regulated by the brain?** 46. **What advances in mathematics, physics, and computer science can be used to enhance noninvasive brain imaging techniques?**

Microwave hearing: Government documents reveal history of an intelligence tool

- Victims report microwave hearing, very negative voices, music and sounds, 24 hours a day for years on end. Victims describe direct communication with the computer programs of military-corporation scientists.

There are several government and scientific books and articles describing the microwave technology capable of creating microwave hearing. Thanks to Margo Cherney's FOIA request, here is the June 1, 1980 NASA abstract Report Number: AD-A090426. Margo received this letter from Brooks Air Force Base, Jan.25, 2000. Freedom of Information Act Request. ".Communicating Via the Microwave Auditory Effect: Awarding Agency: Dept. of Defense SBIR. **The requested information is fully denied under 5 U.S.C. 552(b)(1).**" Copy of letter available upon request.) This NASA abstract clearly demonstrates the military mentality behind the development of microwave hearing.

A decoy and deception concept presently being considered is to remotely create the perception of noise in the heads of personnel by exposing them to low power, pulsed microwave. When people are illuminated with properly modulated low power microwaves the sensation is reported as a buzzing, clicking, or hissing which seems to originate (regardless of the person's position in the field) within or just behind the head. The phenomena occurs at average power densities as low as microwatts per square centimeter with carrier frequencies from 0.4 to 3.0 GHz. By proper choice of pulse characteristics, intelligible speech may be created. Before this technique may be extended and used for military applications, an understanding of the basic principles must be developed. Such an understanding is not only required to optimize the use of the concept for camouflage, decoy and deception operations but is required to properly assess safety factors of such microwave exposure.

The phenomena of 'hearing voices' as in the mental illness, schizophrenia is described in government documents with plans to use microwave hearing for covert military operations. For example, Microwave

News Jan/Feb 1997 p 14. U.S. Air Force Looks to the Battlefields of the Future: Electromagnetic Fields That Might "Boggle the Mind" **"It would also appear possible to create high fidelity speech in the human body, raising the possibility of covert suggestion and psychological direction."**

See also Microwave and Behavior by Dr. Don R Justesen published in American Psychologist Vol. 30, March 1975 Number 3. This article describes in precise terms how Dr. Joseph C. Sharp and staff transmitted the words for the digits 1 to 10 using a modulated version of an Allan Frey type pulsed microwave transmitter, i.e. voice to skull technology. See <http://home.nas.net/~raven1/frey.htm> for full article.

Microwave hearing is not new. A 1976 senate staff report of the subcommittee on Constitutional Rights of the Committee on the Judiciary entitled "Surveillance Technology" is a must read. Page 1280 stated as follows.

From the Federal Times, Dec. 13, 1976 "Microwave Weapons Study by Soviets Cited." The Defense Intelligence Agency has released a report on heavy Communist research on microwaves, including their use as weapons. Microwaves are used in radar, television and microwave ovens. They can cause disorientation and possibly heart attacks in humans. **Another biological effect with possible anti-personnel uses is "microwave hearing." "Sounds and possibly even words which appear to be originating intracranially (within the head) can be induced by signal modulation at very low average power densities,"** the report said. According to the study, Communist work in this area **"has great potential for development into a system for disorienting or disrupting the behavior patterns of military or diplomatic personnel."** No mention was made of the still-unexplained microwave bombardment of the American Embassy in Moscow. The study dealt largely with long-term exposure of days or weeks in industrial situations, which usually produce mild effects. Sort exposure to intense radiation can cause heart seizure and a wide range of physical disorders.

A CIA FOIA search for documents on 'Auditory' listed the following document. "F80-0547, 1974-12-02 untitled (Discusses A Highlight of the Conference on Auditory or Noise-In-The-Head Effect)

[Contents](#) | [Top](#)

Frequently asked question: How can one person can hear microwave hearing while a person nearby cannot?

This is a possible explanation. "US lab Tests Hypersonic Sound for Nonlethal Use", Defense News 9-14-98 page 3, stated ".a weapon that used low-frequency sound waves to incapacitate enemy soldiers. Designed by American Technology Corp. and called **Hypersonic Sound, this weapon is highly directional that enables a user to beam sound at an individual or group of people.** .It causes disorientation, pain and nausea. "It's hard to lead a group of people when you're having trouble standing up and you've just gone in your pants." said Del Kintner, the company's director of military programs."

The article continues to report that this weapon uses a new techniques for using air instead of a plunger-like speaker to create a sound wave. Working with the Naval Post Graduate School in Monterey, CA, **the company uses two beams of ultrasonic sound** at slightly different frequencies and the sum of the two and the difference between the two create different signals. **These signals "can be precisely aimed"**. The Monterey School is also working on "a technology licensed from a German inventor named Hans Raida that can be combined with the HyperSonic Sound technology to create **a high-powered , low frequency, long-range beam of sound, said Marine Corps Maj. Franz Gayle. "Hypothetically, we could make a weapon with huge amplitude using almost no energy,"** Please compare to ultrasonic bug and pest repeller advertisement below.)

[Contents](#) | [Top](#)

Victims describe more symptoms with comparisons to science and military articles

- Victims believe that neighbors, employers, the military, the FBI, defense contractors, cults, masons, ETs, universities, hospitals, the music industry, drug connection or DEA, DARPA, NSA, IDA, CIA, Hughes, Lockheed and similar entities are behind the targeting. Here is an excerpt from the NASA

abstract above and it points to the likelihood of military corporation involvement. The majority of victims believe there is government involvement.

The NASA report above, AD A090426 continues;

Under MERADCOM's In-House Laboratory Independent Research (ILIR) Program an experimental effort to explore the basic interaction

between microwaves and brain function has been conducted. **In a joint program with DERADCOM, Stanford Research Institute (SRI) and Walter Reed Army Institute of Research (WRAIR), it was shown for the first time that lethality, seizures and behavioral performance decrements were strongly frequency and polarization dependent (2,3).** A later collaboration between MERADCOM and WRAIR demonstrated for the first time increases in the differential uptake of saccharides to water in several brain regions of rats when exposed to low power microwaves of the same characteristics which can create the perception of noise in people (4). These increases could be caused by alternations of the blood-brain barrier, brain blood volume, cerebral blood flow, or some combination of the above. In order to better define and understand these results a joint program was undertaken with MERADCOM, Naval Medical Research Institute (NMRI) and the National Institutes of Health (NIH) to measure local cerebral blood flow in conscious rats when exposed to low power, pulsed microwaves. It is these experiments which will be reported here.

- The brain, which is an electromagnetic system can be controlled remotely. The tiny electromagnetic signals can be deciphered and your innermost thoughts can be accessed. Unclassified science articles posted on Cahra website support this claim. In addition, classified research is always at least twenty years ahead of unclassified technology. Please refer to Cahra website for documents to show the advanced level of current technology. One example, BBC News Online Oct 11, 1999, Dr. David Whitehouse, Looking Through Cats' Eyes Fuzzy but recognizable. http://news.bbc.co.uk/hi/english/sci/tech/newsid_471000/471786.stm A BBC News article reported on **the first pictures from an experiment to see through the eyes of a cat.**

A second example, ABCNEWS.com World News Tonight with Peter Jennings March 19, 1998 A Closer Look, Magnetic Therapy for Depression. with Forrest Sawyer, John McKenzie An ABC News transcript described magnetic therapy for depression, **"technology that can be used to manipulate people's thought processes, their mood, their memories and possibly even their will, if it is developed sufficiently."**

As summarized in the New York Times Magazine, Sept 29, 1996, on Magnetic therapy. "scientists realized the key was rapidly pulsing the current on and off. .Here's how it might work: A hand-held computer programs the pattern at which the fields will fluctuate. **The impulses move through the temporal lobe and penetrate deep into the brain, where they interfere and interact with the complex electrical patterns of the subject's neural fields.** .When Persinger focuses the solenoids on the right hemisphere. they sense a negative presence, an alien. If you interfere with the opiate pattern, people get very irritated,"

Here is an examples of the great interest in brain research today. The San Francisco Chronicle, page 1 carried the 10-9-98 article entitle Brain: New Way to Map Mind and it stated, **"More than 25,000 brain experts have descended on Los Angeles to discuss such mysteries as how people hear music, feel pain and learn language."** **"Electrical activity can also be monitored directly, using a system of radar and electrodes on the skull,** according to Kurt Hecox at the University of Wisconsin. He displayed results of one series of experiments last week at the annual meeting of the American Pain society,"

Victims have described it as "like an electronic prison". Every electrical system in the environment can be controlled remotely, including people. Some victims call this 'street theater' and 'perception management'. It seems to be that by changing the timing and emphasis of normal stimuli in the environment, the scientist can see how the victim processes information. Victims report very repetitive, pavlovian type stimulus.

Here is an example of Pavlovian stimulus-response behavioral techniques used in recent experiments. Neuroscience of Mental Health II by the NIH Pub #95-4000 is also an excellent overview of the current state of neuroscience. One of the goals of the NIMH is to

"Completely map all connections within the brain and define these neurocircuits in terms of their functions, morphology and chemistry; the areas of highest interest to the NIMH are those neural systems and tracts involved with cognition and emotions(page

vi)." On page 86 is the following. **"Emotional memory is readily studied in the laboratory using Pavlovian defensive conditioning, also known as fear conditioning. A test subject receives a neutral stimulus, such as a light or tone, simultaneously with a noxious stimulus, such as a mild shock. After a few pairings, the light or tone comes to elicit emotional responses without shock. Through fear conditioning, then, stimuli acquire emotional meaning by way of association with emotional stimuli."**

This quote is from Aviation Week & Space Technology 1-19-98 p.55 on information warfare and US capabilities. ".**techniques as esoteric as 'mapping the psychological and cognitive makeup' of foreign leaders or key groups in order to predict reactions to manipulated information,**". And the follow up story, on 3-9-98, page 21 stated that [USAF Gen. John] "Jumper talked about tools **that could make potential enemies see, hear and believe things that don't exist**" The military is discussing the deployment of weapons to do just that, create symptoms of mental illness. And yet this information is not taken seriously by professionals and has not been accepted as relevant to victim's allegations.

The movie, "The Truman Show" portrays an unwitting subject of a TV program about a man's everyday life from birth on, twenty-four hours a day, until he figures it out. His whole life was engineered from start to finish for the TV program that people would watch. Victims say that the movie is like **'street theater'** except that their case is extremely negative. There is a new television program entitled 'Big Brother' that surveils occupants of an apartment, around the clock. It is a popular program according to the papers.

One excellent example similar to 'perception management' and 'street theater' described by victims is the following. Nonlethal technologies is described in Defense News, 12-14-20-98. The headline reads "Israel Looks for Technology To Fight Hezbollah Guerrillas. "This would include **crowd-control and urban warfare devices that temporarily could paralyze an entire village**, and allow Israeli troops to identify and capture guerrillas". "With these capabilities, we can hunt guerrillas in urban areas without hurting anybody," [Shmuel Gordon, researcher for the Begin-Sadat Center for Strategic Studies] said.

- Most victims report a blatant arrogance in how the technology is used. The attitude that "you will never stop us and we can do anything we want to you," is reported over and over by victims. It seems to be a cruel psychological trick, either to bring out the worst behavior in victims, and/or an effective cover story and diversion for the actual experiment being conducted. Or it is designed to **break personalities, like torture**. It is effective; most victims are left to sound mentally ill while they explain that their neighbors are after them and the government is beaming them with microwaves.

Here is an example of psychological warfare. Senator Sam Nunn predicted that the morale of Iraq's troops would determine the length of the Gulf War (New York Times News Service 1-19-91). The article was entitled "US conducts psychological warfare on Iraq" and described the propaganda efforts used against Iraq. "I believe that the key is the psychology of the Iraqi military," he said, "I certainly think it's possible there could be a psychological breakdown here, and if that happens, it could go very rapidly." It is easier to see what victims are describing in light of the military mindset. The government would conduct human experiments to know how to reliably get the enemy to surrender or to destroy the enemy.

This is an example of unclassified experiments by top scientists. They are studying electromagnetic technology on brain function. Victim claims become less far-fetched in light of this information. In "Approaching the 21st Century: Opportunities for NIMH Neuroscience Research The National Advisory Mental Health Council Report to Congress on the Decade of the Brain", Jan. 1988 by USHHS. Page 49 stated **"Several investigators had noted that when neurons were given brief but intense high-frequency stimulation their electrical properties were changed in ways that would fit those proposed for memory:** The changes were triggered by an electrical event, they were strengthened by repetition, and they persisted indefinitely. .the scientists found that intense high-frequency pulses trigger an unusually large release of calcium in the post synaptic cell."

It is interesting to note that ketamine research was also mentioned on the same page 49. Ketamine has also recently been in the news concerning **unethical research practices funded by the NIMH**, see Sacramento Bee 1-1-99 p A18, "Date-rape drug tested in humans, researchers criticized for 'inducing psychosis'." .test subjects took ketamine, also known as "Special K" or the "date rape drug." **The idea of inducing psychosis in psychology or psychiatry, is the worst thing that can happen,**" Carl Tishler, an adjunct professor at Ohio State U. **"If you are a cardiologist, do you induce a heart attack in someone to see what it's like so you can study it?" ".But scientists say ketamine can give researchers insight into the nature of hallucinations and mood disorders, helping to unlock the mysteries of mental illness. The experiments began in the early 1990s. They were designed to provoke symptoms of**

schizophrenia in healthy people during a one-time exposure, said Dr. Trey Sunderland, chairman of NIMH's review board."

- Victims have described offensive odors, which cause a person to leave an area. Noise campaigns are common. Victims report all type of sound distortions and manipulation of sound levels, even the creation of harassive sounds.

From Christian Science Monitor, 6-29-95 page 3. "**Pentagon explores fighting the Enemy with Glue, Bad Odors.**" Some relevant excerpts include the following. "Funding for other nonlethal technologies are hidden in top-secret 'black budgets,'" And "The Council on Foreign Relations report examined a number of global hot spots in which nonlethal technologies might have been useful."

From Defense News 6-8-14-98 by George Seffers the headline reads "US Urban Warfare Planners Test New Technologies" "Because urban warfare is expected to become increasingly common, the services until 2000 will continue conducting a series of urban warfare experiments. **One of the tests include hearing protection, including some that mute sounds at high decibels while enhancing sounds in the more ordinary hearing ranges such as voices or radio transmission.** The interest in hearing and its psychological effects has been tested on victims for years, according to allegations.

Even in the unclassified sector, new technology includes surveillance for 'abnormal behavior' in order to alert security personnel of criminal behavior such as a car break in New Scientist, 12-11-99 Vol. 164, No. 2216 page 25 by Graham-Rowe, Duncan, described the technology as a computer programmed under the notion that most people behave in predictable ways when walking to their car. **This behavior is transferred into a mathematical pattern and the computer recognizes it as such. "Anyone who deviates from this set pattern, such as someone who walks in circles or who lurks in shadows, will set off an alarm." This is just a small example of human behavior and how it is studied scientifically.** No doubt with the political will and the money of national security defense, as victims are alleging, human behavior has been studied and is controlled by government technology.

- Victims also report that the technology is incredibly sophisticated. Most victims do not openly describe the extent of the technology because it sounds impossible. But victims describe **the same cluster of symptoms over and over.** While technology expert Bill Joy warns of the evils of technology and several editorials such as U.S. News and World Report comment, (see section below), victims can verify that this technology is in the wrong hands and Joy's worse predictions are actually happening.

Here are a few examples of the advanced state of technology. Science Digest 7-84 page 30 stated Thomas Jensen, of Chicago's Rush-Presbyterian St. Luke's Medical Center, and Donald York "have discovered that just before a person says a particular word, the brain emits waves peculiar to that word alone. **These waves are the same from person to person.**"

Dr. Richard Clark at the Flinders University of South Australia wrote the following in Think, Sept/Oct 92. Artificial neural network computer programs are used **"to include the ability to learn and recognize simple patterns of thought from the electrical fields of the brain."**

Science Digest 10-81 entitled "Machines that read Minds" by Gary Selden stated that **"Indeed, CIA spokespeople have admitted 'following' ERP[This is the waveform that the brain characteristically emits after absorbing an external event] research, perhaps the way the agency followed LSD research in the 1950s. .With remote monitors, such an instrument would be a spy's dream."** It is naive to think that the CIA has not exploited this research.

In Nature, 1-22-98 Denis Le Bihan, a researcher at the French Atomic Energy Commission, he stated **"we can almost read people's thoughts"**. The national bioethics committee is taking such threats so seriously that it is launching a study. The title of this article was "Advances in neuroscience may threaten human rights".

Once targeted 99% of victims are targeted for life. This happens in all of the cases reported to Cahra so far. There are many examples in scientific research of longitudinal research. Field studies are very desirable to scientists. Dr. S.B. Sells of the Institute of Behavioral Research at Texas Christian University is one example. He has investigated **space research studies and edited texts on human functioning in longitudinal perspective.** Since most people aren't aware of the vast amount of research, here are a few titles that give an idea of how scientists conduct human experiments. "Studies of Normal and Psychopathic Populations", "Patterns of Deviance", **"Prediction of Outcome from Childhood Behavior"** and "Clinical Picture at First Hospital Admission". The alleged experiments on victims today would be classified but these examples

illustrate the direction and interest of scientists. Because of advanced technology, experiments do not have to be conducted in labs. Psyops as described above can be perfected in the field on unwitting victims. The science of human behavior, although classified, has come of age.

[Contents](#) | [Top](#)

In addition to experimentation, it is a surveillance and political weapon and victims report being systematically discredited

- Victims are labeled as mentally ill and are in this way, 'neutralized', a very old tool of governments. Black bag intelligence break ins, burglaries, slashed tires, mail tampering and other known government intimidation tactics are commonly used on victims.
- Victims are reporting that they are targeted for experimentation, torture and/or harassment because of whistleblowing activity, numerous reasons such as because of their drug activity, to steal their creativity and ideas, political or personal retaliation, military or defense corporation connections or they don't know.

The description of the victims allegations matches the following examples of government motive, clearly stated in a Draft Department of Defense Directive Jan 1, 1995, Non-Lethal Weapons Policy by Dr. Christopher Lamb of the Pentagon's Special Operations/Low-intensity Conflict. Under "Employment, or specific cases of the use of non-lethal weapons", it stated the following. **"The term 'adversary' is used above in its broadest sense, including those who are not declared enemies but who are engaged in activities we wish to stop."** The article does go on to state that it is not for domestic use. The possibility for abuse is there and **there are no safeguards or laws on electromagnetic weapons.**

What causes violence, can a political enemy be remotely controlled to commit suicide or cause a car accident? How are personalities formed, how are multiple personalities created, how can crowds be controlled? How can soldiers be made to kill on command? How does sleep deprivation affect performance in space? The answers are probably classified.

The controversial Dr. Jose Delgado described the following unclassified animal experiments. The New York Post, 3-22-67 headline read "Monkey Rejects Its Young on Radio's Order, Test Explores Way to Aid Mentally Ill". The article states under the subheading "Goal of Experiments",

"This is the latest and most sophisticated of a series of experiments Dr. Delgado has conducted in the electrical control of mental functions. His objective is not to manipulate, **but to explore the physical and chemical basis of emotional and thought** and also to develop new ways to treat the mentally ill. .and to control the sleep cycles of astronauts."

Animal techniques have already been applied to humans according to alleged victims The scientific background, motivation and basis for nonconsensual experiments as described by victims is evident

Victim's accounts are available on a website called the Mind Control Forum and victims have described in agonizing details, their experiences with this issue. It is not known how many victims have died. The Times Herald Record Dec. 15, 1994 reported a New York Times article on this alleged victim who died as a result of experimentation.

Instead, the police said, they [thirty-five university students] were held hostage for two and a half hours by a rifle-wielding psychology student who ranted about a microchip in his brain, threatened to kill the students and demanded to speak to President Clinton, Gov. Mario M. Cuomo, members of Congress, the university president and financial-aid officials. The standoff ended when a 19-year -old sophomore from Long Island lunged at the gunman, who shot him once before others in the class wrestled him to the ground. [Note: The gunman, Tortorici committed suicide in prison.]

The purpose of this paper is to provide an understanding of the problem in order to save just one more victim. People react differently to extreme torture and the goal is to offer real hope for an end to the suffering. Working towards that goal is a better way to channel the absolute rage and extreme emotions which are inevitable as one's life is destroyed and one's mind is literally raped for years on end. Torture has indeed been improved and is a classified science. The heroes are the victims who survive this new Holocaust.

[Contents](#) | [Top](#)

How many victims allege electromagnetic targeting?

There is no accurate count of victims. Estimates vary between 300 to 1,000, to estimates based on radiation and cold war experiments of one half million. I have heard of estimates of 100,000 by another electromagnetic victims group. Recently victims from Japan, Germany, Bulgaria, Spain, Italy, Israel, South America, Canada, England, Scotland and more are going public. Victims are contacting me through my website at a rate of about 3-5 per month and as of spring 2000, Cahra has networked with over 500 alleged survivors.

[Contents](#) | [Top](#)

Russian groups similar to Cahra, with over 1,000 alleged Russian mind control victims

Besides the many victim's stories posted on the Mind Control Forum, over 70 at last count, here is a German television program shown on ZDF, "the second public channel, and quite credible" according to the translator of this TV program. The program is Geheimes Russland (TV-Tagestip, Der Dienstag im ZDF: 22-12.98-22.15. This TV program gives a good description of the techniques used in the experiments. It was entitled

"Secret Russia" Here is an excerpt of the translated article.

"In the future are we going to be remote-controlled robots? Or gods, who with the help of a computer can correct their souls? In the search of answers to these questions, Jerzy Sladkowski went on a time trip through the Russia capital, the way nobody has ever seen it. Since the years of Soviet rule people have spoken furtively in Russia of secret research and experiments, which the Army and the KGB sponsor. Behind a hand held before the mouth they speak of "Zombies" -remote-controlled humans. Rumours are making the rounds, the talk is about victims, psychosis is on the rise. Anatolij Iwanytsch, a 47 year-old former boxer and dissident, has for the last three years acted as the "godfather" of the Moscow "Zombies." His organization has in the meantime grown to about a thousand members from all over Russia. News reports come in constantly from people who claim to have discovered symptoms of a sudden "psychic contamination." Whether and how many of them are actually victims of a remote control of the psyche no one knows. **Since the research about the "production" of remote-controlled humans is one of the best-kept military secrets in today's Russia.** Anatolij Iwanytsch considers himself to be a victim of psychoterror. He is constantly pressuring the state district attorney. He organizes vigils on the most frequented squares in the city. He's making an effort to get support, his past, and his outlook on the future. He is battling so that the "Zombies" will be officially [recognized] as victims [of the state's .] .office, a telephone, and a computer. He demands compensation for himself and his fellow strugglers, who, "as a consequence of psychological terror have suffered and continue to suffer." **The retired (pensioned) engineer and former dissident Slepucha avoids Organizations. He shys away from meetings or vigils in the city. He defends himself alone. The walls of his dwelling are covered with aluminum foil. With the telephone and television set aside, the doors and windows are stuck with primitive shielding, which are supposed to protect against [electromagnetic] energy coming from outside. The householder, who in conversations makes the impression of being completely of sound mind, wears antennae and battery-powered short-wave generators under his hat, which are supposed to protect him from an attack on his mind."**

[Contents](#) | [Top](#)

An explanation: making the connection between cold war mentality and victim's allegations

There have been similar headlines over the years. A New York Times article on Rusty Weston and the

shootings at the Capitol last year stated "**The delusions voiced by such people are familiar to anyone who has worked at a courthouse, a newspaper or a police precinct.** A surprising number of people think the CIA has placed transmitters in their molars, or that **the Pentagon is beaming death rays through their televisions,** or that the White House is secretly controlling their brains." ".Timothy McVeigh who blew up the federal building in Oklahoma City in April 1995 killing 168 people , **believed the army had implanted a computer chip in his buttocks.**" "Weston's recent history -the delusional rage at the government for planting land mines on his half-acre grubstake in Montana and **beaming mind-control rays through his neighbor's satellite dish-**"

The June 2000 Atlantic Monthly reported that while at Harvard College, the Unabomber. Ted Kaczynski, who ranted **against technology** in his writings, **was "subjected to brutal and abusive psychological experiment that today would never be allowed."** Professor Murray ran the psychology experiment and was an OSS chief psychologist who had monitored military experiments on brainwashing and sodium amytal interrogation. While there are many mentally ill people, there may be another explanation for some of the cases reported in the newspapers- mind control government experimentation.

The headline read, "Medhdad Dashti and the Siege of Henry's Bar" and is another example of alleged mind control, which took place in Berkeley. Sadly Dashdi killed a man and was killed himself. The Express, 12-7-90, page 21 stated that Dashti claimed that "**the United States government owed him sixteen trillion dollars because it had used his mind for telepathic experiments**" Dashti said, "As you probably know, some kind of supernatural phenomenon is going on around here by means of which people hear voices in their head. These voices come as different messages relating to our social life. God and different power levels that exist among us. I first noticed in radio and television they were talking to me. I became real mad after a while. **They are not only are reading thoughts, but injecting thoughts into the mind.**" Below Dashdi's quote is the quote of Marshall McLuhan, "Today, after more than a century of electric technology, we have extended our central nervous system itself in a global embrace, abolishing both space and time as far as our planet is concerned. Rapidly, we approach the final phase of the extensions of man- the technological simulation of consciousness, when the creative process of knowing will be collectively and corporately extended to the whole of human society, much as we have largely extended to the whole of human society, much as we have largely extended our senses and our nerves by the various media." Marshall McLuhan, who died in 1980, established his reputation as a communications theorist and his books made him one of the most famous and controversial scholars of the 1960s and '70s.

"California prisoner suits cost millions, clog court systems" the Sacramento Bee reported. Lawsuits filed by California prison inmates cost taxpayers more than \$25 million and Attorney General Dan Lungren is backing legislation to stem the flow. According to this article, Kevin Howard, on death row "**thought his thoughts were broadcast on prison loudspeakers**". Several prisoners have described this symptom. The counterargument is how can this prisoner prove that sophisticated signals are being used? He has no money. He has no proof. See previous Cahra articles on prison experimentation.

Victims sound crazy but what is happening to them may be a product of the cold war, a bureaucracy that needs dismantling. It is logical to question the government's interest in controlling behavior, studying violence and psychological weapons of war without killing.

[Contents](#) | [Top](#)

Sloppy vs. accurate news coverage: get the facts

The media is telling a one sided story of victims, whose behavior looks at first glance to be paranoid. But as in so many issues, there is more to the story. Mind control and psychological weapons are a national security issue and the true facts about victim's allegations are being suppressed in very systematic ways. There is also a bias surrounding mental illness.

For example, here are two articles that are not based on fact. The articles also jump to erroneous stereotypes or incomplete conclusions. A New York Times 8-2-98 article goes as far as describing an American archetype: the paranoid schizophrenic. This article by Joe Sharkey described the **archetype as a deranged man who believes that the CIA and other secret government forces are conspiring to control his mind who goes on a rampage, and innocent people die.** The article cites expert after expert to support the mental illness archetype and ends with the statement by Jackie Goldstein, associate professor of psychology at Stanford University, "But for those who are mentally ill], she said, it is logical, if not reasonable, to fix on bogeymen like the CIA: "Somebody all-powerful is out to get me? It must be the

CIA Why? It's all-powerful. It's done all these bizarre things. And it's secretive."

Here is the second article in support of the stereotypical mentally ill rampage killer. The Washington Post, December 27, 1999, entitled "K-Rock adds new 'shocker.'" discussed Ralph Nader's Public Citizen watchdog group which claims "**A surprising number of people** who think they're receiving personal broadcasts are threatening and even attacking radio and TV stations, according to a new study." **The Ralph Nader group claims "the attacks and threats are the inevitable result of 2.5 million mentally ill Americans walking around untreated."**

Here is a comparison of the above two articles to the next two. Unlike the above, they are factual and the conclusion is based on proven facts. The New York Times, Aug. 4, 1998 reported on a five year Secret Service study of 83 people who attacked or tried to attack an American political figure or celebrity in the last 50 years. The guide and research report are now available from the National Institute of Justice (800-851-3420 or 810 Seventh Street, NW Wash. DC 20531). "The result, recently made available, challenge several stereotypes. **Fewer than half of the assassins showed symptoms of mental illness.**" The article continues, "It would be inaccurate to dismiss these attackers and near attackers as inadequate, unaccomplished losers," the report says. "None were models of emotional well-being," the Secret Service concluded, **"but relatively few suffered from serious mental illnesses that caused their attack behaviors."**

The New York Times April 9, 2000 ran a series on rampage killers after conducting a study which studied 102 rampage killers over the last fifty years. Some of the highlights of their findings revealed the following. "Most are white men. Many are military veterans." It continued, "Society has turned to law enforcement to resolve the rampage killings that have become almost a staple of the nightly news. There has been an increasing call for greater security in schools and in the workplace. **But a closer look shows that these cases may have more to do with society's lack of knowledge of mental health issues, rather than a lack of security.** In case after case, family members, teachers and mental health professionals missed or dismissed signs of deterioration." J Reid Meloy, a forensic psychologist at the University of California at San Diego stated, "There's a planning and purpose, and an emotional detachment that's very long-term."

[Contents](#) | [Top](#)

The medical and psychiatric community's response to victim's claims

The medical and psychiatric community are not investigating victim's claims. Park Dietz, a forensic psychiatrist, is a consultant on high profile court cases such as John Hinckley's court case for shooting President Reagan. He wrote an article for the Los Angeles Times 1-25-98 last year and stated, "Some patients believe that their thoughts are being broadcast to others, that transmitters have been placed in their bodies or that they are under electronic surveillance wherever they go." To challenge this classic belief is a formidable task. There are mentally ill people but they can be separated from cases of nonconsensual experimentation using scientific methods such as the following.

One possibility is to monitor victims for signals, thereby eliminating mental illness as a cause of schizophrenic voices or what victims refer to as 'microwave hearing'. This has been beyond the economic means of victims so far. An article by Malcolm Ritter, AP, May 20 1999 entitled "**pulsing magnetic field might ease imaginary voices in schizophrenia**" may be a research lead to pursue in the future. The article stated "Schizophrenia patients whose medication couldn't stop the imaginary voices in their heads gained some relief after researchers repeatedly sent a magnetic field into a small area of their brains." It continues, "Hoffman, deputy medical director of the Yale Psychiatric Institute is scheduled to present the work Thursday at the annual meeting of the American Psychiatric Association. " "The treatment is called transcranial magnetic stimulation or TMS."

Mental illness: the government's cover story for illegal experimentation

To victims, the arche-type is the 'Cold War Mentality' and the 'Military War Machine'. For the US government to use mental illness as a cover for a 40 year behavior control experimentation program is as logical as the rationalizations of scientists who conducted radiation experiments and the UFO cover story for spy planes cited below. Also, see previous Cahra human rights article.

There is a well-documented history of government behavior control experiments. The obituary of Sidney Gottlieb in Time, March 22, 1999 reported that he was an "eccentric chemist who ran some of the CIA's most shadowy operations, including the agency's **infamous mind-control experiments of the 1950s and '60s**." Gottlieb once said the paucity of U.S. knowledge on the effects of drugs "**posed a threat of the magnitude of national survival**" to explain the existence of MKUltra, a program that mandated dosing unsuspecting citizens with LSD."

EFFECTS OF LOW POWER MICROWAVES ON THE LOCAL CEREBRAL BLOOD FLOW OF CONSCIOUS RATS

KENNETH J. OSCAR, Ph.D
US ARMY MOBILITY EQUIPMENT RESEARCH AND DEVELOPMENT COMMAND
FORT BELVOIR, VIRGINIA 22060

Background

Camouflage, decoy and deception techniques can play a decisive role on the modern battlefield. The rapid advance of surveillance, targeting and weapons homing sensor technology now makes every element which is detected almost assured of being destroyed. Camouflage, decoy and deception equipment and techniques are a low cost way to increase survivability and shift this balance by reducing the signature of targets (camouflage), increasing the signature level of the background (clutter), creating false targets (decoy), and distorting the perceived target value (disguise).

->M [crossout] decoy and deception concept presently being considered is to remotely create the perception of noise in the heads of personnel by exposing them to low power, pulsed microwaves. When people are illuminated with properly modulated low power microwaves the sensation is reported as a buzzing, clicking, or hissing which seems to originate (regardless of the person's position in the field) within or just behind the head [crossout]. The phenomena occurs at average power densities as low as microwatts per square centimeter with carrier frequencies from 0.4 to 3.0 GHz. By proper choice of pulse characteristics, intelligible speech may be created. Before this technique may be extended and used for military applications, an understanding of the basic principles must be developed. Such an understanding is not only required to optimize the use of the concept for camouflage, decoy and deception operations but is required to properly assess safety factors of such microwave exposure.

[Contents](#) | [Top](#)

Chapter 2. Why are victims targeted?

As a result of the atomic bomb, the U.S. government conducted illegal radiation experiments. In brief, as a result of highly classified electromagnetic weapon technologies, victims are alleging illegal ongoing human experimentation today. Evidence supports this big picture. Nobody will inform the public that secrets of brain function were being explored for weapon purposes back in the 1950s. Therefore victims have searched for answers concerning electromagnetic weapon development and related human rights abuses.

There is a mosaic picture of classified military control of the technology for over fifty years and it is a complex, fascinating and still classified story. Here are a few examples. A U.S. Air Force Spacecom military slogan is "full spectrum dominance", while a Russian general made a famous comment that "he who controls the whole electromagnetic spectrum controls the world." See, Electromagnetic-Effect Weapons: The Technology and the Strategic Implications. Wiesbaden Federal Republic of Germany Jan. 16, 1988. Executive Intelligence Review. (Executive Intelligence Review Special Report. 317 Pennsylvania Ave.

SE, 2nd Floor. Washington, DC 20003 (202) 544-7010.

The CIA's MKULTRA program and LSD mind control experiments began in the 1950s, during the time of the Korean brainwashing scare. Albert Biderman wrote articles on the Korean brainwashing "Biderman acknowledges this study was also supported in part by the Society for the Investigations of Human Ecology, which has been reported to have served as a conduit for CIA-funded psychological research." See John Marks book, "Search for the Manchurian Candidate". For an excellent referenced book on the history of government mind control experiments see "The Mind Manipulators A non-fiction account" by Alan W. Schefflin and Edward M. Opton, Jr. 1978, Paddington Press Schefflin is a law professor at Santa Clara School of Law, California.

A quote by the CIA director at a congressional hearing and his comments on the interest in electromagnetic technology is footnoted on my website. Harlan Girard of the International Committee on Offensive Microwave Weapons, received an **FOIA**, (**Freedom of Information Act**), **CIA 1959 MKULTRA, Subproject 119** document as follows,

To make a critical review of literature and scientific developments related to the recording, analysis and interpretation of bioelectric signals from the human organism and activation of human behavior by remote means. As it is visualized, the task should begin with a general survey of research and instrumentation in a number of fields; including neurophysiology, biophysics, anatomy, physiological psychology and neuropsychiatry, as well as electronics, telemetry and communications engineering. At the same time that bibliographic and related activity is initiated, correspondence should be undertaken with all laboratories, companies and agencies working in or carrying out activities related to designated areas of the broad survey problem. Visits to laboratories may be undertaken if needed. The divisions of the problem fall naturally into five main areas; (1) bioelectric sensors: sources of significant electrical potential and methods of pick-up; (2) recording; amplification, electronic tape and other multi-channel recording; (3) analysis: autocorrelators, spectrum analyzers, etc. and coordination with automatic data processing equipment; (4) standardization of data for correlation with biochemical, physiological and behavioral indices; (5) techniques of activation of the human organism by remote electronic means. Progress has been made and the list of laboratories, investigators and resources in the Bioelectronic study is in preparation.

In addition, I have posted citations to the 1970s UN documents from Russia on electromagnetic weapons arms control proposals and they are available at any library with UN documents. One excellent book is The United Nations and Disarmament: 1945-1985 by the UN Department for Disarmament Affairs. (1985) New York, UN Publication Sales

No. E.85.IX.6. It describes Russian proposals to ban electromagnetic weapons from 1975 through 1985. This East West political disagreement, as described in this excerpt from pages 114-116, continues today.

In the last five years, there have been Russian, German, Australian and American TV programs on weapons which target the mind and the media is writing more about this issue. For example an excellent German TV program is; Secret Russia, Moscow The Zombies of the Red Czars A documentary by Jerzy Sladkowski, edited by Agnieszka Bojanowska, camera by Nikolaj Sidortschenko, producer Horst Kalbus, a production by Besta Film, Warschau, Stanislaw Krzeminski. Financed by (the German TV channel) ZDF and (the ??? TV channel) TVP, in close cooperation with (the French/German TV channel) Arte. The documentary aired on the German ZDF Tuesday evening, December 22, 1998, A VHS copy of the documentary is available from the German TV-station ZDF for the equivalent of 80 DM (approximately 40 Euros) plus shipping & mailing charges. To order, be sure to mention the title and the precise date the documentary was shown on German TV (see above). The address is: ZDF Programmverwertung Postfach 4040 55100 Mainz West-Germany

This is an excerpt from "Secret Russia": SPEAKER (continued),

He alleges that the KGB already experimented on him during the 1950's. Fact is, at that time André was a prisoner of the Stalinistic camps and the KGB. Yirena Koslova sleeps in this cage to protect herself against the exterior effects of psychotronic influences. When she notices our expressions of disbelief she shows us an attestation from the International Center of Psychiatry which certifies that she is psychologically perfectly healthy. Yirena used to work for the Moscow district attorney. She was fired after she protested against the suppression of politically sensitive evidence.

Russian victims describe the same symptoms as the American counterparts. Electromagnetic weapons emit

electromagnetic energy which is not visible to the eye. And electromagnetic health effects caused by exposure to electromagnetic energy has not been established by mainstream science. It is controversial. Therefore, like the Russian victim, most victims are assumed to be mentally ill because the weapon cannot be seen like a weapon such as a bullet, and it leaves no scientifically accepted wound like a bullet does. Based on the facts in this book and victim's allegations, it seems clear; victims are targeted for illegal experiments on how to control the brain, how the brain works under stress, in outer space conditions and on the battlefield. These are experiments for outer space, military and psy-ops or intelligence.

[Contents](#) | [Top](#)

Chapter 3. Scientists and victims claim same warnings and predictions

Usually mind control is discounted and portrayed as a fringe issue and yet top scientists have warned about the dangers of mind control technology and predicted that it is a certainty in the near future. This section presents examples of the human behavior of discounting the victim's problem with the result that nothing is done to help the victim. Most victims have been unable to convince friends and family that the government is "reading their mind" or "beaming microwaves at them". The second section presents several world class scientists opinions about mind control. The similarity between the two sections is notable.

[Contents](#) | [Top](#)

Section 1. Victim stereo-type

Victims have been labeled with simplistic terms like 'conspiracy nuts' and 'kooks'.

Here is an example of how victims are lumped with conspiracy theories and loony street people or mentally ill. Jim Martin, who runs Flatland Publishing (PO Box 2420, Fort Bragg, California 95437 or <http://www.flatlandbooks.com>) is an alternative press publisher which sells mind control books and more. He wrote in Flatland Magazine #15 that "**I get calls from Hollywood on an irritatingly regular basis. Warner Brothers called me and picked my brain on 'conspiracy theories,' telling me about some movie they were making which would have Mel Gibson and Julia Roberts.** [This is the movie Conspiracy Theory] based on the ravings of loony Mel, as Jerry Fletcher. .The central plot element involves a mind-controlled assassin who has flashbacks of his mistreatment at the hands of a rogue CIA psychiatrist.] **Just check out Flatland Magazine #11, on mind control, to discover where they came up with their plot line. The audience took it as fantasy.**"

A 1998 movie entitled "Disturbing Behavior" is about a neuro-pharmacist who's devised a behavioral modification program combining simple brainwashing techniques with cybernetics. He plants microprocessors in the kids' brains and transforms them from deviants to motivational blue Ribbon kids and something goes awry. It was rated as "too silly to be frightening." This movie may be disinformation, it is probably just a movie but it is easy to see how victims can be labeled and discounted.

And finally, refer to the victims section to find numerous examples such as the following. A New York Times 8-2-98 article goes as far as describing an American archetype: the paranoid schizophrenic. This article by Joe Sharkey described the **archetype as a deranged man who believes that the CIA and other secret government forces are conspiring to control his mind who goes on a rampage, and innocent people die.**

[Contents](#) | [Top](#)

Section 2. Top scientists warn of mind control technology

From the 1950s to 2000, scientists have been "on the verge of the discovery" of the key to consciousness or the fundamental brain code similar to the discovery of DNA. Here are predictions by Robert Oppenheimer in 1955, Dr. David Krech, UC Berkeley, 1965, Dr. H. Jack Geiger, 1994, Dr. Perpich of Howard Hughes Medical Foundation in 1998, Hans Mark, Director U.S. Defense Research and Engineering in 1999 and Bill Joy, computer expert in 2000.

Robert Oppenheimer wrote "Analogy in Science in The American Psychologist and presented the paper at

the American Psychological Association, San Francisco, CA on Sept 4, 1955. Oppenheimer stated:

There are other ways in which we are brothers. In the last ten years the physicists have been extraordinarily noisy about the immense powers which, largely through their efforts, but through other efforts as well, have come into the possession of man, powers notably and strikingly for very large-scale and dreadful destruction. We have spoken of our responsibilities and of our obligations to society in terms that sound to me very provincial, because the psychologist can hardly do anything without realizing that for him **the acquisition of knowledge opens up the most terrifying prospects of controlling what people do and how they think and how they behave and how they feel.** This is true for all of you who are engaged in practice, and as the corpus of psychology gains in certitude, and subtlety and skill, **I can see that the physicist's plea is that what he discovers be used with humanity and be used wisely will seem rather trivial compared to those pleas which you will have to make and for which you will have to be responsible.**

"Mind Control on Way, Scientist Warns" in the New York Times Dec. 28, 1965. **"Scientists must start thinking now about the possibilities of mind control that their research may soon make possible,** the chairman of a symposium on the brain said today. **"I don't believe that I am being melodramatic," Dr. David Krech,** professor of psychology at the University of California, Berkeley said in the opening of the annual meeting of the American Association for the Advancement of Science." 12-29-65 of the New York Times, Krech suggested that **"probable future capabilities for controlling human minds contain more serious implications than even the successes of the nuclear physicists".** "

Here is a warning and recommendation from a human rights expert. On January 25, 1994 at the Hearing before the Committee on Governmental Affairs United States Senate entitled "Human Radiation and Other Scientific Experiments: The Federal Government's Role", the lead-off government witness, **H. Jack Geiger, MD,** professor of community medicine at City University of New York Medical School and national president of Physicians for Human Rights and founding member of Physicians for Social Responsibility. Dr. Geiger urged that citizens needed to be protected from human experimentation "invoking national security and secrecy."

He stated further;

Second, I think we need to look specifically to the risk that all of this can occur again [radiation experiments], and we have been told frequently that by today's standards, no, it can't. **What concerns me is the likelihood, the possibility, that we will have some other intense national security scare of the kind that we have in the 1940's and 1950's; that we will have some other development of a new category of weapon or potential weapon, whether chemical, biological, radiological, electronic, or other, and that there will be the same desperate urgency, invoking national security and secrecy, to discover the parameters of this threat, the parameters of the potential usefulness of this agent, and therefore to conduct experiments independently and without public knowledge or scrutiny of the kind that have drawn our attention to these.** It seems to me that is critical situation that we have to find ways to protect against, and one answer, at least, is that there should be no research, no matter how secret, no matter how classified as involving national security, that should be independent of the scrutiny of an institutional review board which includes non-governmental scientists not connected with the agencies that are conducting the research and which will apply the same standards and the same protocols both to individual and to public exposures.

Dr. Joseph G. Perpich, director for the grants program at the Howard Hughes Medical Foundation, spoke at the Woodley House Mental Illness Conference in 1998. The conference was aired on CSPAN and Dr. Perpich described the current state of research, "It has not been for lack of interest that brain research has not found its "revolution in neuroscience". He stated that "a New York Times article talked about computer chips to be so powerful that your knowledge and consciousness can be stored and uploaded into a clone's brain" Dr. Perpich was probably referring to the article entitled "Merging of Man and Machine Challenges Natural Selection, 8-14-98, by Rob Fixmer, New York Times. It discussed the 'Soul Catcher' by British Telecommunications PLC which "seeks to develop a computer that can be implanted in the brain to compliment human memory and computational skills." The article continues, **"This area of research may seem far-fetched, but it is really the logical extension of devices like pacemakers, ocular implants, which simulate hearing for the deaf, and neuro-stimulators, which send small electrical charges through nerves to alleviate certain kinds of pain.** The article ends with the warning, **"perhaps the most**

frightening question in these futuristic visions of the mind-machine meld is who or what can be entrusted to run the system."

U.S. News & World Report, March 27, 2000 page 10 reviewed a Wired article by Bill Joy, chief scientist of Sun Microsystems. The article states "**Joy predicts that robotics, genetic engineering, and nanotechnology could prove more dangerous than nuclear, biological, and chemical weapons.** His argument? First, the technologies tempt abuse. Where governments, by and large, controlled nuclear weapons, individuals will handle the new genes-and individuals are prone to mishaps and misdeeds. Second Joy fears these technologies will render human beings obsolete. **This is not, he pleads, science fiction."**

[Contents](#) | [Top](#)

Predictions of future technology

Dr. Dean E. Wooldridge founded TRW in 1958 and quit in 1962 to pursue scientific interests. His comments in a book entitled The Machinery of the Brain, 1963, p. 178 illustrate the mindset on space research of that era. To solve the problem of speed of light travel that may require thousands of years one could "**record the contents of the astronaut's brain.[and transfer to a man made version of the astronaut] the total recorded contents of the brain."**

Fortune December 12, 1994 page 101, "AT&T's \$12 Billion Cellular Dream by Andrew Kupfer contained the following. Craig McCaw, who stepped down as chief executive [of AT&T] when the deal closed in September, is a strategist and dreamer. He's the kind of man who **in an interview with Fortune once suggested in all apparent seriousness-as color drained from the face of a PR man in attendance-that the Federal Communications Commission should reserve spectrum for telepathic communications to be made possible by brain implants he thinks will exist some day."**

Here is example of the same scientific idea. A 1998 article from CNI News discussed the 'Soul Catcher' a chip which makes it possible to imbue a new-born baby with a lifetime's experiences of another person. "**This is the end of death" said Dr. Chris Winter, of British Telecom's artificial life team. He predicted that within three decades it would be possible to relive other people's lives by playing back their experiences on a computer.**" British Telecom would not divulge how much money it is investing in the project, but Dr. Winter said it was taking "Soul Catcher 2025' very seriously. He admitted that there were profound ethical considerations, but emphasized that BT was embarking on this line of research to enable it to remain at the forefront of communications technology."

And finally, see Cahra previous article for quote on Hans Moravec, Carnegie Mellon researcher of the largest robotics center in the world, stated, "**.that within the near future, it will be possible to put a person's personality into a computer and a computer personality into a person."**

A February 22, 1999 Forbes article described the thoughts of Peter Cochrane-the head of research at British Telecom Laboratories (BT Labs), the British version of Bell Labs. Cochrane and **his R&D staff of 660 biologists, engineers and physicists are working on the kinds of technologies that usually exist only in science fiction movies."** In a 1996 paper, Cochrane dubbed this chip [in the brain] "Soul Catcher". The article went on, "Cochrane estimates that silicon implants will be common by 2010." "Cochrane dreams of the ability to access, and even interact with, the greatest minds of our time. **.But if a silicon chip were embedded in their brains, it could capture their thoughts and also be removed once they died."**

From Defense News, August 16th, 1999 "Hans Mark Director, U.S. Defense Research and Engineering. As the chief technical advisor for the secretary of defense and the undersecretary of defense for acquisition and technology, Hans Mark oversees the Pentagon's research, development, test and evaluation programs. **After 45 years conducting or administering military and government research, he is eminently qualified to guide development of new technology for the military.** An excerpt of the interview,

.Q. If you could pick three things for the DARPA [Defense Advanced Research Project Agency] what would you spend money on? A. **The first priority is to get heavily into basic biological research. Why biology? Well, biological warfare is obvious. But there are other things that are perhaps even more important in the long run. .The obvious answer is that there's a computer between your ears that's pretty damn good in lots of ways. Q. So what you're talking about is creating a computer that works like biology? A. Yes. The scientific community already is beginning with neural networks to look at the**

architecture of the brain. Which means you have self-programming and all these things. We now need to look at biology to look at the functioning elements."

U.S. News & World Report, June 12, 2000, page 50 described a conference "Scientific Approaches to Consciousness." The dispute is whether consciousness can be reduced to a quantifiable element. The article stated that **"AI prophet Ray Kurzweil says that computers will exceed human intelligence no later than 2020. Not only that, he adds but computers will merge, with human memories being downloaded into machines and mechanical neural implants being installed in human brains."** Scientists are writing books and actively researching this issue.

Top scientists over a fifty year period have publicly stated the same scientific idea for research and have described how important neuro research is. It would be logical to assume that another branch of the government may be working on it secretly.

CHAPTER 4. HUMAN EXPERIMENTATION

The history of government illegal experimentation:

No codification of the Nuremberg Code or penalties under U.S. Law

The Nuremberg Code came into being as a result of the infamous medical experiments by the Nazis in WWII. Consent by the experiment subject was paramount and the code was adopted by the Department of Defense in the early 50s. In the article, "The only Feasible Means", Jonathan Moreno described the lengthy and highly classified discussions surrounding issue of experiments on humans that were needed as a result of the cold war with Russia. While the Nuremberg Code was adopted in a classified Pentagon policy, "cultural resistance, .was far more subtle and difficult to control. **It was perhaps for this reason more than any other, that the policy's consent requirements were at best sporadically applied in the two decades that followed"** (Hastings Center Report, p. 11). The anti-Communist sentiment dictated that the experiments be conducted in spite of much controversy among the top pentagon officials.

The relevancy of the above is also in its support of the plausibility of nonconsensual experimentation occurring after radiation experiments. How and why or why was the public policy not changed to avoid the problem in the future? It seems that the public was appeased with superficial changes after the expose of radiation experiments in 1993 and the subsequent investigation. Radiation experiments were illegal but condoned. **There were government memos from the U.S. Atomic Energy Commission in 1947 stating, "It is desired that no document be released which refers to experiments with humans and might have adverse effect on public opinion or result in legal suits." Top officials were legally abusing the rights of radiation victims. National Security classification was used to cover it up. This is how top officials can bypass the democratic process.** Because the National Security Law has precedence over the rights of radiation victims, there is no recourse under the current law. There is no process by which current alleged victims can stop the electromagnetic experiments.

The radiation experiment investigation was ineffective to stop classified experiments from happening again because the Nuremberg Code was never codified under U.S. law and there has been little or no punishment for perpetrators of this crime. Few question the horror of Nazi atrocities in the Nuremberg experiments. And yet victims are alleging horrible human rights abuse with electromagnetic weapons which target the mind. In spite of the end of the cold war, it would seem that classified experiments are continuing as national security overrides the rights of experiment victims. H. Jack Geiger of the Physicians for Social Responsibility testified at a 1994 congressional hearing about his fears of classified experiments happening again because of "the likelihood, the possibility, that we will have some other intense national security scare.; that we will have some other development of a new category of weapon or potential weapon, whether electronic, or other and that there will be the same desperate urgency, invoking national security and secrecy, to discover the parameters of this threat." **Geiger advocated an independent review panel for classified experiments, but this has not been done.** From this historical perspective, the cold war ideology can be seen as a major stumbling block in the nonconsensual experiment issue.

By covering up undemocratic and illegal behavior at top levels of the government, the victims of experiments on humans without their consent have been harmed via the **lack of a checks and balances system under national security law.** There has been a lack of effective U.S. law on experimentation and punishment for

crimes such as radiation experiments has never become a statute or law. The underlying problem is governmental abuse of power via national security policy which allows classified experiments. Secrecy and the constitutional rights of the politically powerless experiment victims are in conflict.

Nonconsensual experimentation victims have been made politically powerless by the National Security Act. By defining the rules, those in power who hold the cold war ideology of national security interests at the cost of radiation victims. Those in power are able to carry out their policy. This is how the democratic system worked in practice for radiation victims and now for electromagnetic experiment victims.

The complexity of the issue is apparent. There is substantial historical evidence of another classified experiment program to develop electromagnetic weapons, like the radiation experiments. Without changes, the system will undoubtedly fail over and over in the same way. The codification of the Nuremberg Code and punishment for the perpetrators are essential.

[Contents](#) | [Top](#)

Ethicists predict future illegal experimentation

Ethicist, Jonathan Moreno wrote an excellent 1999 book on radiation experiments conducted as a result of development of the atomic bomb, The CIA's LSD mind control experiments exposed in 1970 congressional hearings, aviation experiments for military flight by the Nazis, war related medical experiments by Japan. and microwave weapons as a source of future illegal experimentation . The book is "Undue Risk Secret State Experiments on Humans", 1999, W.H. Freeman and Co. **Moreno stated that "in the next century, as in the past, military-medical research involving human subjects will be dictated by the limits of information available from other sources".** Based on professional opinions, Moreno is one of many, it would be logical to conclude that there may be classified military weapon experiments that began in the 1950s and continue to this day. It is probable that nonconsensual experiments are conducted by highly classified cold war government bureaucracies to develop electromagnetic weapons and are similar to the atomic bomb Manhattan Project. The classified abuses such as radiation experiments are only now coming to light, fifty years later.

From the government's viewpoint, illegal cold war experiments on U.S. citizens has been the solution. In order to win an electromagnetic arms race, the effects of the weapons on the human body must be studied on human subjects. If there is an electromagnetic arms race, the U.S. would have to test the fundamental knowledge of how the brain and nervous system works for military purposes. Just as in radiation experiments, there would be baseline studies, fundamental stress experiments to find out how to apply electromagnetic technology to make the soldier a superior fighting machine and basic psychological warfare experiments on how to control the enemy, break personalities and scientifically demoralize the enemy.

[Contents](#) | [Top](#)

Universal behavior: Scientists rationalize inhumane experimentation and show no remorse

George Annas stated the issue well in the Boston Globe, Nov. 27, 1996 Pg. A13. As many as 45% of German physicians joined the National Socialist Party, according to the JAMA, Journal of the American Medical Association accounts. He continues, Nazi physicians rallied to see themselves as physicians first with a calling and an ethic dedicated to healing and caring for the welfare of human beings, Instead they were seduced by power and ideology to view the state as the 'patient' and to see the extermination of an entire people as 'treatment' for the state's health. **The fact that we are not Nazis, the author added, does not mean we are immune from seduction by social, political, or economic organizations that seek to corrupt medicine for their own agendas.**

Aviation experiments, such as atmospheric pressure effects on pilots, were conducted by the Nazis in the concentration camps. Since the 1950s, when the first satellite was launched by the Russians, space has been the new frontier. Based on victim testimony and applying the opinions of ethicists such as Jonathan Moreno and George Annas, author of "Nazi Doctors and the Nuremberg Code", illegal, classified human experiments to study the effects of space on man would be the official, classified policy of the U.S. government, just as radiation experiments were.

Annas stated in his book that not one of the Nazi doctors on trial at Nuremberg showed any remorse,

forgiveness or regret. **Eileen Welsome stated in her 1999 book, "The Plutonium Files", the same conclusion about the radiation doctors. They have not admitted guilt, wrongdoing or immoral behavior.** Top scientists knew radiation experiments were unethical but they proceeded nonetheless. For example, the article by Geoffrey Sea, "The Radiation Story No One Would Touch", Columbia Journalism Review, March/April 1994 quoted a 1950 memo to the director of the Atomic Energy Commission, Shields Warren from Dr. Joseph Hamilton of UC Berkeley. The memo discussed the problems of experiments that had "a little of 'the Buchenwald touch' and that chimpanzees rather than humans should be used for experiments of radiation effects on cognitive functions.

The mentality involved in illegal experimentation is clear and hopefully the legal system will take note for future trials involving nonconsensual experimentation. This is an excerpt from "The Plutonium Files" page 479 and 471.

Even though President Clinton, Energy Secretary Hazel O'Leary, and the Advisory committee had publicly acknowledged that many of the experiments were unethical, many scientists couldn't accept the idea that they or their peers had committed any wrongs. They maintained their belief that the ends they had pursued justified the means they used, **expressed little or no remorse** for the experimental subjects, and continued to bash O'Leary and the media for blowing the controversy out of proportion. Page 471. John Nuckolls, the former director of Lawrence Livermore National Laboratory who was also summoned to Washington, said he was taken aback by the way O'Leary had conducted the meeting. "And I was most startled when she invoked her grandmother in response to some of the arguments for why the tests needed to be done, saying she couldn't convince her grandmother of that. This was THE memorable remark of the meeting. I think I would have felt more comfortable if the issue had been addressed on its merits for the national security of the United States and not for what she, with her lack of understanding and appreciation, could explain to her grandmother. So she suddenly introduced this way of thinking about the problem-can we convince the non-technically trained and oriented person of the validity of these requirements. And I would say I was astonished when she did that."

This radiation victim's comment illustrates the deep emotions surrounding the crime of illegal experimentation. As reported in the Sacramento Bee Oct. 16, 1999 article; "A federal jury Friday ordered Massachusetts General Hospital and a retired neurosurgeon to pay \$8 million in damages to the families of two brain tumor patients who died 38 years ago from experimental nuclear treatments. Wiping away tears after the jury awarded her \$2.5 million, Evelyn Heinrich of Westwood, whose husband George, 35, died from the treatments in 1961, said, "I have absolutely felt that the passage of time has not diminished these crimes, not for one minute. **Human experimentation, what could be worse?**"

Victims have reported that radiation scientists have conducted mind control experiments also. Dr. Sweet was accused of mind control experiments in a court case filed on behalf of Leonard Kille, an engineer who was implanted with electrodes. Dr. Sweet is the retired neurosurgeon mentioned in the 1999 article above. There has also been articles on Sweet's research of violence and prediction and his collaboration with CIA's L.J. West. (See Cahra website, Human rights article).

Here is a description of an unethical Russian experiment for space exploration. Bulletin of the Atomic Scientists May/June 1994 Vol. 50 Issue 3 page 16 "Cosmonauts Number Zero, After 20 years, the Soviet space program's human guinea pigs tell their story. by Nin Chugunova. **In 1960 to late 1970s, there was a secret group called "Cosmonauts Number Zero" .recruited human subjects in space research. The Institute of Medical Biological Problems "collected data on new technologies, data from different work modes, and of course, data on human endurance."** One participant described one experiment. "Before the heart probe they gave me some substance that paralyzes all the muscles while you remain conscious. The psychological shock was so intense that it took me four months to recuperate. The procedure itself took four hours. I would lose consciousness, then wake up and think, this torture is still going on. **I remember it with horror. It's horrible, horrible.**" Across all nationalities, experiment victims are abused and the scientists display inhumane disregard for what they have done.

[Contents](#) | [Top](#)

1994 U.S. illegal experiments in other countries

The April 29, 1998 London Times carried a front page article by Andrew Glasse in Oslo entitled

"Experiments on patients alleged" The report continued,

"American and Norwegian hospitals were involved in sterilization experiments on mentally retarded people using radiation in an echo of the Nazi era. Most of the work was done during the Cold War but some continued until 1994, according to the Oslo daily Dagbladet. "With chilling echoes of the Nazi era, the Americans and Norwegians were intent upon assessing the effects of radiation on different parts of the body and apparently had no qualms about the use of subjects who were 'easy to deal with'. according to Fredrik Mellbye, 81, who revealed the shocking details of the project. He is a former colleague of the then director of Norway's health services. **Mr. Meilby said the Norwegian experiments were carried out with the co-operation of Americans 'at the highest level' and that Norwegian doctors were encouraged to seek US financial support. public investigations in America have revealed that authorities there financed about 4,000 such experiments on humans between 1944 and 1994.**"

This could be analogized to the next major weapon after the atomic bomb, electromagnetic weapons, as victims are coming forward internationally with the same set of symptoms.

[Contents](#) | [Top](#)

How illegal experiments can happen now

The government will never inform the public about nonconsensual experiments. There would be too much abuse to admit to, too many court cases to settle and plausible denial at the top levels of government. According to the 1990s government Radiation Advisory Report, this is how radiation experiments were conducted, (See "Plutonium Files" by Eileen Welsome, 1999).

Given the many victims reporting the same cluster of medical symptoms over fifty years and the history of secret government experiments, it is highly likely that there were and are electromagnetic technology nonconsensual human experiments. In addition, national security regarding electromagnetic technologies today is comparable to cold war security surrounding the atomic bomb. A 1997 US News and World Report article on 'Wonder Weapons', stated: **"And for a good 40 years the U.S. military has quietly been pursuing [nonlethal electromagnetic] weapons of this sort. Much of this work is still secret," Louis Slesin, a trade publisher for the electromagnetic industry further stated, "People [in the military] go silent on this issue more than any other issue. People just do not want to talk about this."**

As a result of the national security laws, government officials officially lie and the public will have to figure out what is going on without a trust in what the government says on the issue. But evidence in support of ongoing nonconsensual electromagnetic experimentation is available to those who investigate. Dr. Robert O. Becker, two time Nobel prize nominee, scientist and researcher of electromagnetic radiation effects on the body and author of Body Electric, summarized, **"The government has never disproved the psychological effects of electromagnetic radiation." Becker quote from CNN news broadcast, Special Assignment, Nov.-1985, by Chuck DeCaro, "Is there an RF Gap Weapons of War". For a 55\$ copy of this tape call CNN at 404 827 2712 and ask for R2501 #13, R2747 #33, R2501 #15, R2501-#17** This is an excellent tape featuring Dr. Ross Adey, Dr. Becker, the Russian Lida machine, Dr. Rauscher, Dr. Bise, Dr. Jose Delgado, Tom Bearden and more. It runs about 20 minutes.

Here is an answer to the reasoning "This could never happen." People are capable of unethical behavior, especially if there is no accountability. There are no checks and balances under the very powerful national security law. This is the pattern for radiation experiments and now electromagnetic weapon nonconsensual experimentation. "The U.S. government would never experiment on U.S. citizens today." This is a typical reply to nonconsensual experimentation victims. But by examining the evidence, the question becomes, "Why would the U.S. government NOT experiment on U.S. citizens today?"

There is an answer that isn't clear at first glance but by examining Stanley Milgram's experiments in 1974 on the willingness of individuals to follow orders that called for administering electric shocks to others, it becomes clearer. This famous experiment was recently quoted in a book for a graduate level government class, entitled The Dynamics of American Politics, Approaches & Interpretations, edited by Lawrence C. Dodd and Calvin Jillson, 1994, Westview Press, page 292. It discussed narrow cognition and the established evidence for the idea that "the moral agency of humankind is substantially conditioned by narrow cognition(March and Simon,1958)" or by "the tendency to identify with others in one's immediate orbit of

contacts and activities". This has implications for unethical experimentation on another human being. The horrendous radiation experiments by the U.S. government, the Nazi and the Japanese medical experiments, fit Milgram's narrow cognition model. **It means that your neighbor or the person on the street has the capacity to torture and this is not in some distant foreign communist country as the cold war mentality has suggested.** Please refer to Cahra website, human rights article for documentation on who and why people torture other people. It is not as uncommon as most believe.

[Contents](#) | [Top](#)

Unregulated, unethical corporate experimentation today

A Sacramento Bee June 7, 2000 p A newspaper article entitled, "EPA rejects human experiments to set pesticide limits", stated

"Since the 1960s, chemical companies have quietly submitted to the EPA scores of studies in which humans were knowingly exposed to pesticides. Questions over the ethics of such tests returned to the spotlight two years ago when the Environmental Working Group, a Washington-based advocacy organization, **reported a surge in human experiments in Britain in the 1990s.** The researchers, working mainly for U.S. companies, paid youthful volunteers about \$600 each to ingest small amounts of pesticides over several weeks, according to documents obtained by the environmental group. Last April, a similar study was conducted on student volunteers in Lincoln, Neb., by pesticide manufacturer Dow Agrosiences Ltd. Public outcry over such experiments led to the creation of the special EPA advisory committee on human experiments in July 1998. **But instead of offering ethical guidance on the issue, the panel quickly bogged down into bitter and sometimes public disagreement over whether human tests could ever be ethically acceptable.**"

[Contents](#) | [Top](#)

Example: [London] Times Article - Allies' Nazi-style tests

(London)

THE TIMES WEDNESDAY APRIL 29 1998

US and Norway 'used insane for Nazi-style tests'

From Andrew Glasse in Oslo

American and Norwegian hospitals were involved in sterilisation experiments on the mentally retarded using radiation over a 20-year period up to 1994.

Although most of the work was done during the Cold War, some experiments continued until as late as four years ago, according to the Oslo daily *Dagbladet*.

With chilling echoes of the Nazi era, the Americans and Norwegians were intent upon assessing the effects of radiation on different parts of the body and apparently had no qualms about the use of subjects who were "easy to deal with," according to Fredrik Mellbye, 81, who revealed the shocking details of the project. He is a former colleague of the then director of Norway's health services.

Last night the State Department in Washington was seeking clarification of the report from its embassy in Oslo.

"An unknown number of [...] had taken place. "I cannot remember that anyone at any time put

their foot down to stop what was happening," he said. "Both authorities in the health services, psychiatrists and other doctors knew what was going on."

The revelations follow admissions by the Swedish authorities last year that 4,500 mental patients were made to undergo lobotomies in an officially sanctioned programme that lasted almost 20 years. Sweden has also admit- [...] sirable racial characteristics or signs of 'inferiority,' poor eyesight or sexual and social deviancy."

Last year the French launched an inquiry into reports that 15,000 Frenchwomen had been illegally sterilised without their consent after being declared unfit for motherhood. All were sterilised by state-run institutions.

Mr Mellbye said the Norwegian experiments were carried out with the co-operation of Americans "at the highest level" and that Norwegian doctors were encouraged to seek US financial support.

Dagbladet said public investigations in America have revealed that authorities there financed about 4,000 such experiments on humans between 1944 and 1994.

After Norway was liberated from Nazi occupation in 1945, it was eager for US military and economic assistance. When the Soviet Union, which shared a border with Norway, [...]

[Contents](#) | [Top](#)

Chapter 5. National security law

National security law: the underlying problem, why victims are not getting help

National security law prevents access to government information and is one major reason why victims are not getting help. Several related examples illustrate this problem. On a 1985 CNN news program the Pentagon stated that "**radiofrequency weapons are 'too sensitive to discuss'**". Quote from CNN with reporter Chuck DeCaro "The Soviet Union vs. The U.S: Is There an RF Gap?" 11-16-85

Recently the director of the NSA would neither confirm nor deny the Echelon Project at a 2000 US congressional hearing. And further, Rep. Porter Goss stated, "the NSA operates in a very secret environment **without any oversight or legal strictures in place to guide and control (its) conduct.**" Quote from Sacramento Bee, 4-13-200 "U.S. citizens not targets, top spies say NSA, CIA deny abuse claims" p. A1

And there is the U.S. government's huge disinformation program to hide special access classified projects from the public. For example, The Sacramento Bee, August 3, 1997 page A13 headline reads "CIA, Military lied about UFOs to hide spy planes." by William J. Broad New York Times. "In the darkest days of the Cold War, **the military lied to the American public about the true nature of many unidentified flying objects in an effort to hide its growing fleets of spy planes, a CIA study says.**" There have been several allegations that UFO abductions are a cover for mind control experiments and this needs further investigation.

The UFO cover story continues today. For example, the headline in the Sacramento Bee 1-31-98 read "No laughing matter '**UFO' base ruling gives government too much secrecy.**' Known as '**Area 51**', the Air Force has refused to acknowledge its existence even though there is plenty of evidence. Walter Kasza, reportedly worked on the base for seven years and claimed he was exposed to poisonous smoke as hazardous waste was burned on the base. He has died and Kasza's widow and four others sued the federal government. President Clinton issued an order exempting the base from all environmental laws. And the appellate court ruled that everything involving the base is a state secret .the government may use the state secrets privilege to withhold a broad range of information, Judge Pamela Ann Rymer wrote on behalf of the 9th US Circuit Court of Appeals. "Accordingly, if seemingly innocuous information is part of a classified mosaic, the state secrets privilege may be invoked to bar its disclosure." **The article then editorialized that this ruling "leaves the door wide open for the government to obfuscate a range of wrongdoing by claiming that the information surrounding these events cannot be untangled from legitimate state secrets."**

National Security is more sophisticated and entrenched today than in the past. In this article, the government policy on controlling the media for national security purposes is clear. The The 4-27, 5-3-92, p. 34 Washington Post article by George Lardner reported on a 1992 CIA report on "Greater CIA Openness". Director Joseph DeTrani stated **"PAO [CIA's Public Affairs Office] now has relationships with reporters from every major wire service, newspaper, news weekly and television network in the nation," the report said. "This has helped us turn some 'intelligence failure' stories into 'intelligence success stories, and it has contributed to the accuracy of countless others. "In many instances," the report continued, "we have persuaded reporters to postpone, change, hold or even scrap stories that could have adversely affected national security interests or jeopardized sources and methods,"**

In The Bulletin of Atomic Scientist article entitled, "The Soft-Kill Fallacy," Sept/Oct 94 p. 43 Steve Aftergood stated, "The government secrecy system as a whole is among the most poisonous legacies of the Cold War. **the Cold war secrecy system also mandates ACTIVE DECEPTION."**

The article continues, "A security manual for special access programs authorizes contractors to employ "cover stories" to disguise their activities. The only conditions is that **"cover stories must be believable."** Even the government is starting to recognize that official cover and deception programs are getting out of hand and need to be curtailed. A Joint Security Commission established by the secretary of defense and the director of central intelligence reported in March that "the use of cover to conceal the existence of a government facility or the fact of government research and development interest in a particular technology is broader than necessary and significantly increases costs."

Obviously, the media will never publish a major story on this issue without the government's permission.

This is an example of how the military can control information that reaches the public. In the San Francisco Chronicle 10-31-98,pA7 article which stated, "Inside a brand-new, \$30 million brick building at Fort Meade Anne Arundel County, Md, hundred of soldiers, airmen and sailors are hard at work preparing. The officers and troops are students at the **Defense Information School**, where the Pentagon is now sending every one of the 3,500 military journalists it trains each year to join one of the biggest media machines in existence." One lesson cited was **"to respond to every question without necessarily answering it"**. It is interesting that the article points out the many students who "find it hard to accept that the military should be open with information that might embarrass the government."

Here is illustration of an official policy to lie in the name of national security and for money, through the 1990s. In the book, Policy Paradox, The Art of Political Decision Making by Deborah Stone, Norton Books, p319, the author discussed examples of lying by top public officials for national security and financial reasons. The book referred to a New York Times article 8-18-93 p. A1 entitled "Lies and rigged 'Star Wars' test fooled the Kremlin and Congress". **A top official lied so that the Kremlin would think that the Star Wars weapons were more powerful than they were.** Another New York Times article P. A1 on 7-23-94 was entitled "Inquiry finds Star Wars tried plan to exaggerate test results" **A DOD official lied to congress and inflated tests of Star Wars technology in order to receive funding.** The following GAO report has the full story, GAO/-T-PEMID-93-5.

This is an example of serious violations of the law by the CIA with no punishment and consequent motivation for the CIA to discontinue this practice. **"CIA destroyed records of 1953 Iran Mission, Agency had vowed to detail role in coup"** This is the Sacramento Bee 5-28-97 headline. Both Robert Gates and James Woolsey, CIA directors publicly pledged that Iran records would be released as part of the CIA's openness initiatives. But the records had been destroyed in the 1960s. A historian who was a member of the CIA staff in 1992 and 1993 said that the records were obliterated by "a culture of destruction" at the agency. This is a breach of faith by the government. The CIA is uninformed of their own business and no one from the CIA, who most assuredly knew of the destroyed records, came forward to correct the CIA directors. Where is the enforcement of the laws for government lies, illegalities and cover up?

Because there are extensive official documents stating that electromagnetic technology is classified, (see this book and previous Cahra articles for citations) and in light of the official policy of lying and the past history of classified radiation experiments, current victims and the public need to be aware of the extensive efforts in effect today to cover up the currently classified weapon testing programs. There would have to be a current cover story for electromagnetic weapon testing and nonconsensual experimentation. The government can not be trusted. One final example, the **U.S. military withheld information about possible links between Agent Orange and birth defects**, and downplayed the defoliant's link to cancer. This was reported in the Sacramento Bee Nov. 1, 1998 p. A4. There are many more examples.

[Contents](#) | [Top](#)

Tightly Controlled Information: the public can't even find out if a scientist is conducting classified research

The same handful of scientists have discussed this issue publicly to a limited extent, over the last forty years. This includes Dr. Jose Delgado, Yale University, Dr. Karl Pribram, Stanford U., Dr. Robert Becker, two time Nobel nominee, Dr. Eldon Byrd, quoted in US News 7-7-97, Dr. Rauscher and Dr. Bise, predicting electromagnetic weapons to put a whole town out of commission in two weeks in 1985 on CNN, Dr. Ross Adey, world class electromagnetic radiation expert and Dr. Michael Persinger, now in Canada, and his theories of emr (electromagnetic radiation) creating God and UFO emotional experiences. The government has been known to cut off funding or other similar difficult to prove blacklisting techniques. These social pressure techniques are unofficial but people talk about them off the record. The word spreads quickly on what can and cannot be leaked. Numerous examples have been given in this paper. A current example is the scientist who sponsored the book honoring Dr. Schwan's work. He was also listed as an attendee at a nonthermal electromagnetic radiation conference. The nonthermal effects are the biologically active reactions to electromagnetic radiation, while the thermal effects are the heating effect only, as in a microwave oven. Dr. Schwan does not believe there are proven nonthermal effects. He set the U.S. military standards for EMR exposure limits in the 1950s. This would seem to be an excellent example of how the electromagnetic research is controlled off the record.

None of the scientists named above will talk directly, but will say they believe mind control is a weapon. They are to be admired because they talk more than most. The top scientists and government advisors such as Dr. Freeman Dyson describe technology to interface with the brain in their scientific books but when asked about electromagnetic weapons which target the brain, Dr. Dyson gave what seemed like a superficial national security answer, "that's not science". This is in contradiction to his previous papers on the topic. Also, top government officials such as ex-CIA director Woolsey stated that he was not aware of Defense News and other reputable sources on Russian mind control technology. That is an illogical reply, to say the least. (for further info on Woolsey quote, see executive branch section, Dyson, see Chapter 12, What can be done.media).

[Contents](#) | [Top](#)

No whistleblowers in national security issues

It is very unlikely that an insider will go public with the technology. For example, twenty five Star Wars Marconi defense workers mysteriously died by suicide and strange accidents in the early 1980s in England and was reported in a book by Tony Collins. The book is "Open Verdict An account of 25 mysterious deaths in the defense industry", Sphere Books Ltd., a division of MacDonald & Co. Publishers London, 1990. Collins wrote, **"This book is about a new type of war, electronic war. It is fought by research students in universities and electronics engineers working for defense contractors. It is a war that must be waged constantly during peacetime to maintain the upper hand. It is a war that must be waged in secrecy."** Tony Collins is executive editor of Computer Weekly. He worked for the BBC and national newspapers, such as Sunday Mirror.

The editor of the Collins book, Stephen Arkell described the discrepancies found during his investigation and problems such as the following.

"The companies and establishments where they worked are reluctant to give out details of any projects, even those already in the public domain. **In addition, there are many other project, so called 'black' projects, which these organizations cannot even officially admit to. The secrecy surrounding the peacetime preparations for a future electronic war ensures that any attempt to prove or disprove a definite work link can be not more than a calculated stab in the dark.** In May 1989, for example, eleven Russians and four Czechs were expelled from the UK for allegedly trying to obtain **highly sensitive information about powerful microchips, radar, laser technology** and advanced materials such as titanium and carbon fibres. These agents were reported to have approached the executive of defense contractors in a series of 'cash for secrets' deals. Another theory concerns the investigation into alleged fraud at Marconi. This investigation [by the Ministry of Defense Police] has since resulted in

charges being brought, .However there is not one scrap of evidence to suggest that any of the scientists named in the book were involved in fraud. .the deaths and disappearances of 28 defense workers is one of the most bizarre and enigmatic stories of the past decade."

A June 1989 Hustler magazine article entitled "Who's Killing the Star Wars Scientists", suggests that

"the Russians are using a death ray to drive the scientists to suicide. The British press blames stress. This wave of suspicious fatalities in the ultrasecret world of sophisticated weaponry has not gone unnoticed by the US government. Late last fall, the American embassy in London publicly requested a full investigation by the British Ministry of Defense. (MoD). .The Pentagon refuses comment on the deaths. But according to Reagan administration sources, "We cannot ignore it anymore."

The cover story and national security lies do not fit the facts and reality. Scientists have to lie for national security. Government officials are doing their job by lying to the public or denying the existence of these powerful weapons. Victims are trying to save their lives and must realize how the system and human nature work so that they can move forward with planned strategies.

[Contents](#) | [Top](#)

The underlying problem: A classified electromagnetic arms race

The U.S. won the arms race but weapons are still being developed. Please see international section below for details. There is significant evidence of an arms race to develop electromagnetic weapons. Rupert Pengeley, of the International Defense Review has **compared the atomic bomb to nonlethal electromagnetic weapons** and stated: "who will be first to use nonlethal, [electromagnetic] weapons so that they too will never be used." There are United Nations documents discussing electromagnetic weapons in 1975 when the Soviet Union had proposed a ban on the development and manufacture of new types of weapons of mass destruction and new systems of such weapons. A US-Soviet debate continued until 1996, when the resolution finally passed. In 1979, the Soviet Union clarified its position and provided a specific list of some types of potential weapons of mass destruction. **"Infrasonic 'acoustic radiation' weapons. They would utilize harmful effects of infrasonic oscillations on biocurrents of the brain and nervous system;" The UN document continues by describing "Electromagnetic weapons operating at certain radio-frequency radiations, which could have injurious effects on human organs".** (See CAHRA website, international article for full quote.)

The newspaper article by Barton Reppert, AP Extra, May 22, 1988 entitled "The Zapping of an Embassy: 35 Years Later, The Mystery Lingers " is the ongoing story of the Russian microwave bombardment of the U.S. Embassy in Moscow since October 1953. Relevant excerpts from the article illustrate the government's motive to develop mind control technology. "The U.S. government still has not determined conclusively-or is unwilling to reveal- the purpose behind the beams. .Richard S. Cesaro served as deputy director for advanced sensors at the Pentagon's Advanced Research Projects Agency and also helped run the classified Pandora Project, in which monkeys were exposed to a 'synthetic Moscow signal' in a laboratory at Walter Reed Army Institute of Research. Arguing that the Soviet block's investment of funds, personnel and laboratory facilities in research on non-ionizing radiation bioeffects has far outstripped the West's, he [Cesaro] said, "I look at it as still a major, serious, unsettled threat to the security of the United States." [Cesaro continued] **"If you really make the breakthrough, you've got something better than any bomb ever built, because when you finally come down the line you're talking about controlling people's minds,"**

The international human rights community is aware of the dangers of electromagnetic weaponry Dr. Barbara Hatch Rosenberg wrote in Sept/Oct 1994 Bulletin of Atomic Scientists, page 45, **"Many of the non-lethal weapons under consideration utilize infrasound or electromagnetic energy (including lasers, microwave, or radio-frequency radiation, or visible light pulsed at brain-wave frequency) for their effects.** These weapons are said to cause temporary or permanent blinding, interference with mental processes, modification of behavior and emotional response, seizures, severe pain, dizziness, nausea and diarrhea, or disruption of internal organ functions in various other ways. The article concluded that ".international discussions are now underway that may lead to the development of specific new protocols covering electromagnetic weapons; a report is expected sometime next year."

Louise Doswald-Beck and Gerald C. Cauderay wrote the following in the International Review of the Red

Cross 279, Nov.1, 1990, "**In spite of the rarity of publications on this subject, and the fact that it is usually strictly classified information, research undertaken in this field seems to have demonstrated that very small amounts of electromagnetic radiation could appreciably alter the functions of living cells.** Research work has also revealed that pathological effects close to those induced by highly toxic substances could be produced by electromagnetic radiation even at very low power, especially those using a pulse shape containing a large number of different frequencies." The article further stated, "**Some research seem to have confirmed that low-level electromagnetic fields, modulated to be similar to normal brainwaves, could seriously affect brain function.**" The article continues, "**Research work in this field has been carried out in almost all industrialized countries,** and especially by the great powers, with a view to using these phenomena for anti-materiel or anti-personnel purposes."

Dr. Robin Coupland of the International Committee of the Red Cross has warned about **weapons which can create psychosis and epilepsy** in a 1997 British Medical Journal article.

1989 Break up of the Soviet Union: major international incident led to exposure of 'mind control weapons'

And finally, here is a list of several articles, mainly from the last ten years, which **coincide with the break up of the Soviet Union in 1989**. Most are from the former Soviet Union and concern 'mind control technology'. Victims have been trying to expose this technology since the 1960s. Like the dropping of the bomb at Hiroshima, only with major incidents or the passage of time are classified weapon technology publicly revealed. The break up of the Soviet Union is one such incident.

Chapter 6. Victims have problems with bureaucracies

Congress, the judicial system , the executive branch, human rights groups: band aid help but no solution

Understanding how the government and international human rights community operate. An example: "Declining Congressional Behavior of Congressional Intelligence Committees in the 1970s and the 1990s"

Please note: This section is a 1996 'A' college paper. The democratic congressional system does not work for illegal experimentation. This lesson can be applied as well to other branches of government and the international human rights community. Victims will have to be resourceful and realize that the system is biased and unfair. I hope that the next victim will not go through the time and expense that I did to find this out.

[Contents](#) | [Top](#)

Intelligence Committee behavior from the 1970s to the 1990s: a decline

Congressional behavior can be analyzed by examining the congressional intelligence committees in the 1970s and in the 1990s. The overall trends of decentralization, the influence of money, iron triangles, (military, congress, industry alliances) and the congressional bureaucracy will show that as in many other congressional issues, the system is not meeting it's goals. This ongoing declining trend can be seen by looking at the history and accomplishments of the intelligence committees during the last thirty years. The CIA was labeled a rogue elephant during the 1970 congressional investigative hearings and unfortunately is seen in the same light today. **The CIA has increased it's power and has weakened democracy.**

The intelligence committees are a special congressional case because of national security and secrecy issues. Secrecy conflicts with democratic principles and democracy has been the underdog in this balancing act. Congressional intelligence committees are less accountable to U.S. citizens and more influenced by the military industry complex and politics. There are few whistleblowers and current laws do not encourage let alone protect them. **Senator Moynihan is one of the few trustees of national and democratic principles who will stand up against the CIA.** Unfortunately, he has had little overall effect on the behavior of the CIA.

Corruption is rampant. For example, **Congresswoman Barbara Boxer reported that the National Security Act is used as a cover for scandals, paybacks and overpayments by the military-industrial complex.** By unnecessarily classifying projects as black, there is accountability to no one. (Morrison, David "Dancing in the Dark." National Journal. 4-11-87, page 868) The congressional system itself is in need of change. **For example, congressional bureaucracy rewards those who find loopholes in the law. The National Security Act was used to cover up the Iran Contra Affair and it's flagrant violations of the law by the Reagan administration and the CIA. Punishment for these white collar crimes was lessened as President Bush pardoned six of the accused Iran Contra players.**

The 1990s political climate compared to the 1970s is perceived as more corrupt, more bureaucratic, more secretive and less democratic. Political policymakers such as the President and the Congress have to respond to the military industrial complex in order to receive support and lessen opposition to their reelection

campaigns or proposed legislation. There are many other examples to support this declining trend.

[Contents](#) | [Top](#)

Intelligence committees of the 1970s

The CIA was formed by the National Security Act of 1947 and **has been independent of congressional oversight until the 1970s**. It is critical to note that illegal CIA behavior has been discovered by leaks in a majority of the cases and not by monitoring functions of congress. The pattern then is a public outcry followed by congressional investigations. An internal CIA investigation called the "Family Jewels" **was leaked** in 1973 and behavior control LSD experiments and assassination plots conducted by the CIA became public knowledge. The 1974 and 1977 hearings took place and permanent intelligence committees were established for the first time.

It is a telling point that the intelligence committees were temporary or select committees. This is an indication of the CIA's influence to minimize monitoring of the CIA by Congress. It was only later that the committees became permanent.

The pattern since 1947 has been for congress to work on problems as they arise and to take no logical initiative since there is no political reward for confronting the CIA. An overall cold war philosophy has allowed abuses and patterns to continue. The CIA began when the antagonistic relationship with Russia developed into a cold war. An example of how Congress approaches a problem is the Watergate scandal in 1972 in which CIA employees were caught breaking into the Democratic party headquarters. There was a crisis and as public outcry faded, congress implemented a watered down revision and enforcement of the law.

Congressional committee leaders have had a major effect on the intelligence community. The Church committee had a very positive effect. Senator Frank Church was known for his ability to discipline members to keep secrets and for his thorough investigative approach. The Boren committee was well managed by Senator David Boren (D-OK) and he is responsible for implementing the recommendations of the Church and Iran-Contra committees, a very significant accomplishment. And there have been equally negative effects. In the House of Representatives, House Speaker Tom Foley was responsible for putting politics before efficiency and he chose several poorly qualified chairmen. (Smist, Frank J. Jr. "Congress Oversees the United States Intelligence Community Second Edition 1947-1994, U of Tennessee Press, 1994, page 307) The house intelligence committees have not always worked well with the executive branch or within the committee itself and politics have affected outcomes more often than in the Senate. The house members have proven less dedicated and less willing to spend time on unanimous consensus building as the Senate has successfully done.

[Contents](#) | [Top](#)

Ongoing problems of the intelligence committees

The intelligence agencies are not empowered to make foreign policy but to carry out executive orders. There had been a long term covert policy from 1980 to 1992, in which the U.S. supported the Afgan rebels against the Soviets. The executive branch political reasoning was that the Soviets were paying a heavy price for their expansionistic policy (Smist, 327). But the World Trade Center Bombing was a direct and unexpected outcome of this covert policy. Arab militants associated with the Afghans were behind the bombing. Many questions are raised by the use of intelligence agencies by the executive branch, such as public unaccountability.

From 1947 to 1975, the CIA had an agreement with the president to shield the president from responsibility for his covert action decisions. This is known as "the doctrine of plausible deniability" and the CIA would take steps to divert the trail of responsibility for covert actions from the President to other sources. Secretary of State Henry Kissinger testified before the Pike committee: **"Every operation is personally approved by the president."** After this applied to every president since the CIA began (Smist, 196). This was a step towards putting the blame onto the President and off of the CIA. The intelligence committees even had documentation to prove Kissinger's profound statement. But the intelligence committees were never able to prove or charge a president in any crime. The doctrine of plausible deniability was used to cover up illegal, unconstitutional activity by the president. This is another example of a turning point in democracy but the

media missed it and the responsibility of the president for illegal covert actions was not to be enforced.

Up until 1991, congressional intelligence committees followed the political winds and at times would sidestep unpopular actions in order to please everyone but unfortunately accomplish little. By putting forth the relatively harmless proposal that most would accept, Congress monitored the CIA in a disproportionate and ineffective way. The CIA was increasing its power and going unpunished for its crimes. And the cold war was the perfect excuse for increasing secrecy.

[Contents](#) | [Top](#)

National security vs. democratic principles: the special dilemma of intelligence committees

Kathryn S. Olmsted wrote a book about government secrecy after Watergate, entitled "Challenging the Secret Government: The Post-Watergate Investigations of the CIA and FBI, 1995, U North Carolina. **She sees a relationship between the investigative reporters deference to the CIA and congress. National security concerns and the cold war are used as an excuse for letting the CIA run rampant.** The political climate favored the secrecy trend.

The National Security issues are conducted in closed congressional hearings and are not reported to the public. And what is reported about the CIA to the public is slanted and biased to favor the military-industrial complex and its influence by money. It reflects a co-opted relationship of the congressional committees and the CIA. These are glaring examples of CIA unaccountability. It adds to public cynicism when the CIA is unaccountable to the U.S. public. Eventually the U.S. public and democracy will pay the price.

Recently, the CIA has stated that they have no files of radiation experiments and involvement by the CIA even when other government agencies have memos and documents to prove otherwise. (Radiation Advisory Committee. "Final Report: Advisory Committee on Human Radiation Experiments" GPO, 1995) And on CSPAN's Washington Journal, May 6, 1996, there was an interview with Robert M. Gates, director of the CIA from 1991-3, on his new book, "From the Shadows". He state that William Colby, director of the CIA in the 1970s had to disclose to Congress the CIA family jewels list of abuses in congressional hearings and if Colby refused, then it would have destroyed the CIA. Colby was unpopular for his frank testimony and would not have been forthright if he did not feel political pressure to reveal the information. **There was no law to impel Colby to tell the whole truth to the congressional committee and no reliable way for the congressional committee to insure that he was telling the truth.**

[Contents](#) | [Top](#)

Identifying the problems of the intelligence committees

A pitfall in managing oversight of the intelligence agencies is the lack of verification of information. The intelligence committees do not know the questions to ask because they may not know the covert actions that are classified. And the CIA directors are under no pressure to reveal all information since punishment is minimal for withholding information. It is not hard to believe that there is much that the intelligence agencies are not revealing that is illegal and going undetected.

There is currently no enforced or meaningful recourse for lying to congressional committees or other related illegal acts. Oliver North admitted that he lied to Congress. President Carter failed to notify Congress of the Iran hostage attempt as directed by law. He did not trust the Congress not to leak this information. And Congress is known for illegally leaking information. Senator Moynihan is notorious as was Les Aspin for leaking classified information. And information is leaked for political purposes. This unethical behavior adds to the public's perception of contempt for Congress. When combined with the fact that there are few checks and balances to the National Security Act, it becomes only a matter of time before abuse and corruption occur.

The unspoken congressional philosophy of bowing to the CIA and to sweeping problems out of the view of the American public are deeply entrenched. The U.S. public live a busy lifestyle and unless the problems of the CIA affect them directly, their limited time and energy will not be spent on seemingly remote problems. The CIA has many tools to keep their problems out of the public eye. Therefore, many political tools and congressional maneuverings can minimize illegal behavior. A good example of this is the Iran Contra Affair.

The law was revised so that the National Security Act could not be an excuse for covering up a crime. This was a band aid remedy in the face of a major crisis.

[Contents](#) | [Top](#)

Possible solutions

American and Congress are larger in size than ever before and cynicism, detachment and alienation are indicators that the congressional system should be improved. Since Watergate, the U.S. public have lost confidence and trust in the U.S. government. With democratic minded leaders, more education of the U.S. public could reverse some of the negative trends. The media has been used in a positive way by the intelligence committees. CNN broadcast the extensive hearing on the Robert Gates nomination for director of the CIA and the public was informed about the operations of the CIA

There has been little influence by clientele groups on the intelligence committees. There was no political muscle to exert and citizen groups such as the Committee on Law and National Security, a branch of the American Bar Association were ineffective in promoting civil liberties in any meaningful way. This is a critical area to change.

[Contents](#) | [Top](#)

Congressional intelligence committees in the 1990s

A new report out on the "Roles and Capabilities of the United States Intelligence Community" discusses how to reform the intelligence agencies now that the cold war is over. President Clinton appointed the Brown Commission and the report was released on March 1, 1996. The mission of the CIA since 1947 has been to collect and analyze intelligence for the NSC and the president. Suggested changes have included merging the CIA and FBI and a form of this has been recommended by the commission. After the bombing of the World Trade Center in 1993, this became a more popular view. Now there is an Intelligence-Law Enforcement Policy Board that combines the two agencies while keeping the agency charters separate. The Board now meets twice a week.

Other areas of debate within the commission is whether the CIA should be active in industrial espionage. The conclusion was not in favor of this. The CIA has been reported to have spied on Japanese negotiators in the bilateral auto talks. The CIA has violated many laws since 1947 and with little punishment, it is not surprising that they continue to do so.

In 1995, President Clinton also signed a classified order which outlined the intelligence community and it's goals. The users of CIA data outlined what they want the CIA to provide them. This is another example of the minimal amount of information available to the public and lack of monitoring or uninvolved third party to ensure that the U.S. intelligence agency spends tax dollars in legal and economically sound ways. There are political repercussions for the congressman who rocks the boat. It can be expected that this will continue.

Overall, new laws and legislation have not put the power in the hands of the majority but in the hands of the powerful and rich. These trends have continued for the last thirty years and a mechanism for correcting these trends is needed.

Congress will likely continue to have a relatively minimal role with the CIA. The bureaucracy will continue to reward corruption. Money and politics continues to negatively influence the behavior of congress. And in part, by shrewd political gameplaying, the CIA is stronger today than in the past.

Congress in the 1970s was new. Now it is established and should have improved. It would be expected to have a better record of carrying out it's congressional duties. The intelligence committees are more methodical and conduct appropriations tasks and uses the best congressional power, the power of the purse, over the CIA. There is more oversight and accountability by Congress but the corruption of the overburdened political process and U.S. public cynicism and apathy have outweighed it's progress. Overall, the performance of the congressional intelligence committees has declined.

Unbiased oversight, more accountability and national security vs. democracy issues need to be addressed. These should be top priorities. The congressional system has failed to correct these major problems and this is another indication of declining congressional behavior from the 1970s to the 1990s. Why has a major

scandal, the Iran Contra Affair happened after the 1970s committee investigations into similar presidential and CIA abuses of power and illegal activities? Inadequate safeguards failed and this is another indication that the intelligence committees are not effectively performing their duties.

And as a closing and telling example of the continuing trends, congressional and presidential committees are discussing major reforms of the CIA now that the cold war is over. The CIA is promising that they are reforming but the U.S. public should at least understand the political game.

As a footnote on congressional political influence, pharmaceutical companies are very interested in human experimentation and are very politically powerful USA Today, 8-19-99 "**The pharmaceutical industry spends more money on lobbying and campaign contributions than any other industry in the country. They spend more than the insurance industry, the tobacco companies, the oil companies, the gun lobby, and every other special interest.**"

[Contents](#) | [Top](#)

The Executive branch: why there is a negative response

In the 1994 book, "The Semi-Sovereign Presidency Capitol Hill insider Charles Tiefer, acting general counsel to the U.S. House of Representatives, wrote about how **President George Bush circumvented Congress and used National Security Directives to create law and obscure the facts from the public.** Page 24 describes in detail this development of new national security powers in the executive branch. This is how the democratic system has worked in reality and in developing a strategy to stop nonconsensual experimentation, victims must account for it or waste their limited resources. Electromagnetic weapons are a national security issue and it is likely that directives would govern policy on their use.

The [National Security Act of]1947 created the National Security Council, consisting of the president and vice president and certain Cabinet members, with one staffer, the executive secretary. .Occasionally, the NSC staff exercised authority through a new species of presidential directive. These directives were called National Security Council policy papers in the Truman and Eisenhower administrations, National Security Action Memoranda in the Nixon and Ford Administrations, and Presidential Directives in the Carter Administration. **These directives took on the perilous role of secret law: They authorized action and specified the limits of the action, just as a public law or a public executive order would.** This Cold War history provided the tools used by President Bush's NSC to manage the courtship of Saddam Hussein in 1989 and 1990 and to hold back congressional oversight of this courtship in 1991 and 1992.

Here is one of many examples of lack of help at the executive level of government. Sept. 3 1997 reply from ex-CIA director R. James Woolsey, "A quick perusal of the material you sent reveals nothing with which I am familiar." Woolsey was referring to the 1993 Jan 11-17, Defense News article on Russian soldiers and

electromagnetic signals used to increase their fighting capabilities and similar articles, (see Cahra website). The counterargument of course would be, why does an ex-CIA director NOT know about these important weapons? Woolsey continued, in response to questions of allegations of U.S. mind control experiments, "Conspiracy theorists always seem to me to forget that we have: 9a) a First Amendment, (b) two independent branches of the federal government outside the executive, and (c) a federal system." The counterargument would be that this did not help radiation victims.

How the legal system operates: political influence at the Supreme Court level.

Former CIA officer during the Vietnam war, Frank Snepp wrote the 1999 book "Irreparable Harm" and discussed the CIA's law suits against him for allegedly not getting pre approval for any articles, books or speeches that deal with intelligence activities. His case went to the Supreme Court. Again, politics determined the negative outcome of the case. Snepps wrote a well documented chapter on how he found out after his Supreme court case that politics at the Supreme Court level affected the outcome of his case. He argued convincingly that Justice Powell used his influence on other Justices to form a majority opinion, based on Powell's personal political views and not the facts of the case. Snepp wrote,

" Seventeen years after the Snepp ruling, I visited the library to search these [Justice Marshall] for insights into how and why I'd been clobbered. .Justice Brennan gave me permission to examine his own private records of the case. Together with the Marshall files, they provided as complete an insider's perspective as I could have wished for. **Far from wanting to see my case deep-sixed, he [Powell] hoped to convince his brethren to take another look at it and to rule against me brutally. The proof of this is to be found in a document he circulated among them six weeks later. Bearing the title "Mr. Justice Powell Dissenting," it calls on the Court to take up my appeal for the sole purpose of destroying me financially. The effect of this Sermon on the Mount was catalytic, bringing five the number of justices who thought my appeal worth hearing on the most prejudicial grounds possible. No one in the newly forged majority had bothered to examine the raw case files.**

On page 353, Snepp then described another revealing document by Justice Powell, which may explain Powell's crucial role in the court decision against Snepp. Snepp raised the question of whether Powell was "so viscerally antagonistic toward me [Snepp] and all I stood for that he couldn't possibly have voted any other way".

.I happened upon **an extraordinary document he'd [Powell] written for the United States Chamber of Commerce in 1971, the year before he'd joined the courts. this confidential memo titled "Attack on the American Free Enterprise System,"** No thoughtful person can question that the American economic system is under broad attack," he [Powell] remarked **.He named the culprits: "the Communists, New Leftists." Among his most hated bugbears were Ralph Nader and the ACLU which Powell complained had exploited the judicial system to advance its liberal agenda "The national television networks should be monitored in the same way that textbooks should be kept under constant surveillance,"** he [Powell] said. [Snepp] concluded "to a man of these sensibilities, the Frank Snepp case must have seemed the payback opportunity of a lifetime.

[Contents](#) | [Top](#)

Human rights organizations will not touch this issue: no political will

Joel Primack and Frank von Hippel wrote the 1974 book "Advice and Dissent, Scientists in the Political Arena". No doubt, national security policy comes before human rights and this is the harsh reality often overlooked by victims. Politics play a major role in the science community area also. Page 262 described the Federation of American Scientists (FAS). Public organization officials and government officials overlap.

The FAS had been born in the post-war scientists' campaign for the assignment of responsibility for atomic energy to an agency under civilian control.) In the late 1960s at about the same time a substantial number of high-level government science advisors began to move

outside government and work through the FAS-partly in order to bring before Congress the ABM debate. .and by 1972 a former head of the elite Jason group of Defense Department consultants, Marvin Goldberger, had succeeded former Director of Defense research and Engineering Herbert York in the (unsalaried) FAS chairmanship. .(**In 1973, Jason shifted its affiliation to the Sanford Research Institute**, another think-tank largely supported by the Defense Department.) .**The AEC, NSF, and Department of Health, Education, and Welfare (HEW) all devote several hundred million dollars annually toward sponsorship of research in universities and federal laboratories**, .PSAC (President's Science Advisory Committee) members also supervised a number of scientific panels on specialized topics, consisting in all of several hundred scientists. was to provide independent advice on technological issues to the President .advice which could serve to check and counterbalance the sometimes self-serving recommendations sent to the White House by the executive-branch agencies.

Dr. John Pike of the Federation of American scientists replied to a victim's request for help in an email dated Aug. 1998 and stated that, "the number of issues that they have the resources to work on is small relative to the possibilities." **While he felt that "the victim's claims were based on adequately established technology**, there are hundreds of issues and FAS chose not to address" this issue. Human Rights Watch, the International Committee of the Red Cross and Amnesty International, also have chosen not to deal with this issue, even with repeated requests

Chapter 7. Electromagnetic technologies and national politics

The Cold War is over: What will the U.S. government do?

By examining a few of the many articles on nonlethal technologies, one can see the outlook of the military and government and how the 'crazy' claims of victims correlate with ideas such as the new 'war on terrorism' and the 'war on crime'. **The military has found another campaign to sell their high technology to the US public.**

The experiments described by victims fit the goal of governments **to control and predict behavior**. By conducting baseline studies, the breaking point of different personality types can be predicted. And there is a long history of psychological experimentation Just two examples is Pavlov who discovered a fixed number of personality types of dogs to B.F Skinner and his "control the environment and create the man," i.e. his behaviorism model of human behavior.

From the article, "The Soft-Kill Fallacy, Bulletin of Atomic Scientist, Sept/Oct94, p40, Steven Aftergood describes the origin of the military's public relations program to introduce non-lethal weapons to the public in the 1990s. **"The concept of non-lethal weapons is not new; the term appears in heavily censored CIA documents dating from the 1960s."** This supports the chronology of victim's claims which began as early as 1955.

The 1978 book The National Academy of Sciences by Cochrane echoed what others have observed; Page 343, **"By December 1937, it was becoming clear that Germany, Italy, and Russia were using the Spanish Civil War for the field testing of modern weapons."** The Americans used Viet Nam to test new electronic weapons and this is a good research lead. Evidence of the use of electromagnetic technologies has been found in the Vietnam war and the Gulf war so far, (see Cahra website and progress section below.)

It is difficult to predict government policy, but it is likely that the government believes that the formidable intelligence tool of reading people's thoughts, communicating directly with the brain, controlling every nerve in the body and discovering how the brain works for military purposes **is too powerful a weapon to declassify**. It's importance has been repeatedly compared to the atomic bomb by many experts since the 1950s See previous citations. The United States, it would seem, is declassifying non-lethal weapons because technology advances demand that they do so. This could be one of many reason why there has been so much talk of domestic tools to fight terrorism and nonlethal weapons to be used for peace-keeping purposes. Some of the rest of the world is catching up but the US has a major lead in technology.

A fifty year old cold war bureaucracy is controlling the use of this technology and no one person is deciding the policy on its use. U.S. Mind control technology was developed because the Russians were developing it too or vice versa. The exact facts are classified. But comparisons to the cold war mentality can help in the search for evidence and documentation. Here is an example of an unclassified abuse of power at the top levels of government, a system in which the democratic checks and balances are not working. The Iran Contra Affair was approved at the highest level, the presidency. As reported in Iran-Contra, The Final Report by Lawrence Walsh, Independent Council, 1994, p. 201, "**As CIA director, Casey and President Reagan shared similar world views, at the center of which was their determination to roll back communism and bring about the collapse of the Soviet Union.**" What is worrisome is the unaccountability of billions of dollars in black budgets and groups of people in government who are breaking the laws, such as in the Iran Contra Affair. **Even more disturbing, as reported in Iran-Contra,**

p. 526, is that it was not "a cabal of zealots" on the National Security Council staff, as the congressional select committees concluded in their majority report. **Instead, it was the product of two foreign policy directives by President Reagan which skirted the law and which were executed by the NSC staff with the knowledge and support of high officials in the CIA, State and Defense departments.** "

Similarly, the possibility of abuse of electromagnetic and neurological weapons is enormous. It is proving more difficult to keep mind control a secret forever, after fifty years of the development of behavior control weapons and since the technology is being tested covertly by so many people, on so many people, . The control of this technology is and will be played out by the major powers of the world. Unlike the case of biological weapons, third world countries cannot develop this weapon and are vulnerable and powerless in the face of this technology.

[Contents](#) | [Top](#)

Corporate control of electromagnetic technology

Like the atomic bomb, mind control technology is or will end up in the corporate sector but with much governmental control. It most certainly is controlled internationally. The level of technology needed to develop this technology is available in a limited number of countries with the requirements to manufacture it but money can change this factor. This is important because it creates a direction for victims to further research.

Once the technological basis of mind control are deduced, it may be productive to investigate arms and technology export/ import reports for further evidence. A Los Angeles Times 6-7-98 A1 article stated that as a result of the DOD slashing weapon purchases by more than half, the arms maker industry turned to foreign markets as part of a strategy that also included mergers and diversification into some unlikely lines of business. "Lockheed Martin Corp., for example runs welfare offices in Florida and Texas." It is not difficult to figure out how the connections between government and corporations are overlapping. This is clearly a global issue.

Oak Ridge National Lab, which is operated by Lockheed Martin Energy Research Corp for the US Department of Energy reported the following in an abstract entitled "Virtual Human". A computational model of the human is being developed to evaluate nonlethal technologies. **Science & Engineering Associates, Inc. have a website at <http://www.seabase.com/engineer.htm> [now <http://www.scieng.com/>] with the following statements. "We also provide support of multiple government agencies for laser countermeasures, spectroscopic sensors and systems, high power microwave, electromagnetic environmental effects and less than lethal weapons technologies.**" Again, there is significant proof of the widespread corporate, military overlap in the development and distribution of electromagnetic technology. And the top arms makers such as Textron, Lockheed Martin and General Electric make significant political contributions to influence arms policy.

There are companies like E Systems, a corporation which develops classified electronic surveillance technology for the US government and hires many ex-intelligence agency personnel (Washington Post, 10-24-94, A1). Competition is increasing and E Systems want to enlarge their market. Loyalty to the United States takes a second seat to economic concerns. The program, 60 Minutes aired an expose on this decades-old corporation which hires ex-intelligence agency employees. "IBM subsidiary admits illegal exports to Russia" stated the 8-1-98 Sacramento Bee newspaper article.

There are again many examples of the motivation of money rather than patriotism. "Spy Director Has Ties to

Firm" 10-23-95, Spotlight newspaper, p14. "While on the faculty at MIT, Deutch apparently spent more time serving on the boards of big corporations than in teaching or research," says a long-time Senate oversight investigator. In 1988-91, just before Deutch became deputy secretary of defense, he drew hundreds of thousands of dollars as a board member of Scientific Applications International, (SAIC), a major California defense technology supplier. Now SAIC is under federal criminal investigation for allegedly selling the US Air Force defective electronic cockpit instrument designed for the F-15 jet fighter." There are many corporations and leads to investigate.

One more example is the 12-30-98 Washington Post front page article on retiring Air Force Lt. General Leonard Perroots who spent three years as DIA director and is now President of the company Vector Microwave Research Corporation. **"Vector was a leading entrepreneur in a classified or 'black' specialty with high stakes and few rules: covertly acquiring foreign missiles, radar, artillery and other weapons for U.S. intelligence agencies."** Federal agents are investigating the company for illegalities. Perroots has made public comments on mind control technologies.

[Contents](#) | [Top](#)

Military cooperation with civilian law enforcement agencies: bureaucratic entanglement

An example of the military, civilian cooperation is the memorandum of understanding on 'Operations Other than War' between Deputy Secretary of Defense, John Deutch and Attorney General Janet Reno. **"The agencies agreed to joint development of "advanced technologies and systems" that can be applied to both military operations and civilian law enforcement.**(this memorandum gave rise to the program now managed in large part by the Advanced Research Projects Agency.) This is an alliance that will expedite the entanglement of the military in domestic law enforcement." This article appeared in The Progressive, Jan. 1996 p22.

And another of the many examples, "FBI Gives Anti-Terrorist Aid for Local Agencies, New department to help train for domestic attacks". This 10-17-98, San Francisco Chronicle article discussed the new National Domestic Preparedness Office and Janet Reno is quoted as saying, "State and local governments (will be) a full partner in the planning effort." The overlapping jurisdictions are occurring more often.

[Contents](#) | [Top](#)

No political will to declassify electromagnetic mind control technology

Those with the power have too much to lose to expose this technology to the public. There is an industry that has built up around this technology for over 50 years. Here are three examples. The San Francisco Chronicle on 8-28-98 p 21A headline reads "Livermore Lab to Join FBI in Fight on Terrorism. **From nuclear research, Livermore is expanding in order to survive financially.** Now they will work on international and domestic terrorism anti-crime technology. FBI director Louis Freeh has stated **"the FBI potentially could be the most dangerous institutions in the United States" if its "awesome powers" are not held in check. (Washington Post National Weekly Edition Aug. 11, 1997).** U.S. News and World Report July 7, 1997 reported the following in an article on "Wonder Weapons". "Louis Slesin, editor of the trade journal Microwave News stated **"That's because the human body is essentially an electrochemical system, and devices that disrupt the electrical impulses of the nervous system can affect behavior and body functions. But these programs-particularly those involving antipersonnel research-are so well guarded that details are scarce."** "People [in the military] go silent on this issue," says Slesin, **"more than any other issue. People just do not want to talk about this."**

The money to keep the electromagnetic programs going after the cold war may be found in war on drug and anti-terrorism programs. Here is a good example. Star-ledger, 4-26-90 Washington Post wire service page 5 reported that the **" Air Force has put into service a costly new radar and have plans for radar systems in Alaska, the West coast and North Dakota to help impede drug trafficking flights. The radar's high-powered radio energy bounce off the ionosphere and scoop up billion of "return" signals at massive antenna farms on the northern coast of Maine. An array of computers "surveys the myriad returns to detect aircraft at extraordinary distances. The Air Force budget cuts forced the transfer of the program to the Pentagon's drug interdiction budget."**

In fact, this type of array could track people instead of planes, again, it is a physics problem to pick up the

unique signals from each human. In Genesis Vol8 No. 6, Dr. Richard Clark of Flinders University of South Australia wrote that each person's brainwave is unique to that individual, like a finger print.

Mind control technology would be a business decision and distributed throughout the federal bureaucracy today. According to the GAO/NSIAD-90-07BR page 8, "**Section 6163 of the Anti-Drug Abuse Act of 1988 is based on a study performed by the Defense Science Board in 1987 to examine the use of innovative technologies for the detection and neutralization of illegal drugs and terrorist weapons.**" The DOD, CIA, NSA and National Laboratories are coordinating their research and technologies which include physical/electronic surveillance and radar to be used to curb drug abuse. This program may be a good program but much of it is classified and there is no public accountability. After the cold war, the need for funding is diverted to programs such as the drug war and terrorism. Again, the bureaucracy is large and involved huge sums of money and it can be seen how individual rights can be rationalized away for the greater cause.

If one examines the evidence and similarities to the accounts, the electromagnetic involuntary experimentation is a very systematic program based on principles of torture, psychological warfare and aviation technology which now includes space exploration. Radiation experiments have been replaced with controlling the body and mind remotely and its applications to space research. **It is a weapons development program and the technology is designed to achieve the politically correct objective of controlling the enemy rather than the unpopular objective of death.** Military planners learned the Vietnam lesson well. The U.S. public does not consider war deaths lightly and the political costs are tremendous. Therefore to keep the military in a good light, the policy is one of promoting a perception of a deathless war and to avoid the political costs of confrontations. Note the examples of President Johnson's resignation over the Viet Nam War and the Iran Hostage failed rescue attempt during Carter's administration and Carter's subsequent low standing in the opinion polls. The effect on presidential politics is clear.

[Contents](#) | [Top](#)

Secrecy and billions of pentagon dollars

Here is an example of the problem with secrecy. "One immediate consequence of the excessive secrecy is a wasteful duplication of effort. Justice Department officials who surveyed some of the 'black budget' programs for possible law enforcement applications found the same technologies being developed in as many as six independent programs. **We've been startled at the number of times we've run into this, says David Boyd of the National Institute of Justice. The waste results from a lack of independent oversight of non-lethal programs, which-like other highly classified 'special access' or 'black' programs in defense and intelligence-operate beyond the reach of the checks and balances that US citizens take for granted.**" From Bulletin of Atomic Scientist, Sept/Oct94 p 43, entitled The Soft-Kill fallacy by Steven Aftergood.

"Spy agency leader apologize" reported the New York Times News Service on 8-11-94. This article is an example of how secrecy works, the huge sums of money spent on surveillance technology and the unaccountability by top government officials for over 30 years. The NRO is a multi-billion dollar fleet of spy satellites and a new NRO office was built with money concealed by breaking it up into different accounts in its operating budget. This was normal, they testified in a congressional hearing, because it was a covert operation. **The NRO was a state secret until 1992, classified more secret than top secret.** Jeffrey Harris is the director and Jimmy Hill, the deputy director. Victims have traveled all over the world and are harassed wherever they go. The level of technology supports the allegations by victims of electromagnetic nonconsensual experimentation.

"CIA to probe files for radiation abuse", Boston Herald, Jan. 5 1994. **Steven Aftergood of the Federation of American Scientists, a private research group, said earlier he believed the CIA may have destroyed many of the relevant documents and the full extent of radiation tests, many on people who did not give their consent, may never be known.**" The article continued, "A commission led by Vice President Nelson Rockefeller reported in 1975 the CIA had conducted radiation tests, by implication on unsuspecting subjects, as part of a much larger CIA program to study possible means of controlling human behavior."

Here is an example of secrecy at top levels of the government and industry in the field of electromagnetic technologies. A foia [freedom of information act request] reply to the information below was unclassified rather than declassified and concerned protection of harbors from attack in war.

"In 1950, long after the end of WWII, Dr. Zacharias accepted an invitation for the U.S. Navy to be the director of a classified summer study called Project Hartwell. The esteem held for Professor Zacharias and the recognition of the value of this study was evident in the list of those who agreed to participate. It included, among others, an outstanding radio and radar authority, Dr. Harold T Friis, .supervisor at Bell Telephone Laboratories, and the following persons, Dr. Jerome Wiesner, President, MIT, Dr. Edward E David, Jr. President Nixon's Science Advisor, Dr. James B Frisk President Bell Telephone Labs., and Dr. Ivan Getting President Aerospace Corp. **Today many would find it surprising that a classified study, aimed at developing new avenues for further classified research, would have received such strong support as these names indicate.**"

Here is an example of excessive secrecy in which the CIA admitting that it knowingly lied to the White House and the Pentagon. This false information "was crucial to Washington's perceptions of Moscow in the last seven years of the cold war, said members of the Senate and House intelligence committees," The threats reported in the disinformation "contributed to the Pentagon's decision to spend billions of dollars on weapons systems to combat threats that might have been illusions"(New York Times News Service, 11-1-95). Victims describe the technology as extremely sophisticated and the many attempts to monitor, block and escape from the signals used have failed. With billions of dollars available to the Pentagon for years and with the documented unaccountability and the motivations to develop state of the art weapons, victims who are enduring torture today deserve a thorough investigation.

The article in Times May ?, 199? entitled "Cold War Secrecy Shrouds Nearly 6,000 U.S. Inventions" discusses patents and national security. **"Robert E. Garrett, director of the office that oversees secrecy orders at the Patent and Trademark Office, acknowledged that the restrictions were unusual in that they could block the publication of information developed entirely by private individuals. The only comparable law is the one that prohibits people from publishing information about building atomic weapons."** It is not hard to imagine a secrecy order covering electromagnetic mind control weapons. The article continues, "Perhaps the most surprising shift is that a growing proportion of the inventions placed under wraps are ones in which the Government does not hold title to the patent. Some of these inventions have been developed in part with government funds, but the companies that obtain the patent holds all or part of the ownership interests. "John Preston, head of licensing for the Massachusetts Institute of Technology, said that his university had received several secrecy orders over the years but that almost all had stemmed from inventions at the Lincoln Laboratory, which MIT operates under contract for the Federal Government."

Michael Aaron Dennis, Cornell University, wrote the 1994 Isis article entitled "Our First Line of Defense, Two University Laboratories in the Postwar American State. He wrote about the MIT I-Lab or Instrumentation Lab and Charles Stark Draper, director. Dennis stated, **"Classification plays an important role in the materials presented in this essay. Like so much else at each of these laboratories, much of the archives are inaccessible.** Dennis described Draper's work, which " took place behind the laboratory's locked doors, [building an airplane inertial device]"

In response to a 1958 television interview with Draper and Eric Sevareid, veteran CBS reporter in which Draper displayed a plane outfitted with Draper's inertial device, the air force issued this memo to his lab. "To again reiterate AF [air force] policy on the matter of safeguarding classified information the following should be brought to the attention of all personnel: 1. The fact that articles and information will be reviewed by this HQ and DOD [Department of Defense] does not relieve each individual of his responsibility to safeguard classified information and further will not serve as a bar in processing violations of security regulations." Dennis stated, **"What was visible on television remained unspeakable outside the I-Lab."**

Dennis concluded, "Yet, if classification obscures our view of the military's role in society, especially in laboratories, then it is also through the classification system that the civilian and the military were connected in postwar America in novel, and still largely unexamined, ways." It is overclassification to keep the archives classified 30 years later.

A final example, Christophe Lecuyer, Stanford U, wrote the HSPS,23:1 (1992) article "The making of a science based technological university: Karl Compton, James Killian, and the reform of MIT, 1930-1957. On page 177:

MIT reluctantly agreed to carry out investigations of a classified nature. For example, the RLE [Research Lab of Electronics], which did mainly open research during the immediate postwar years, was asked to carry out large classified programs such as "communications systems for

both combat areas and the zone of the interior" during the Korean war. More subtly, as Paul Forman has shown, researchers had to comply with unwritten rules. **They were expected by such agencies as the ONR to practice self-censorship and to publish only results that would not endanger national security.**"

There is a strong argument for revising the national security act. There are numerous examples of abuse and a need for limits and a democratic process of checks and balances imposed on the national security act.

[Contents](#) | [Top](#)

Chapter 8. Electromagnetic technologies and international politics

It is helpful to look further into the international control of electromagnetic technology and mind control of victims, who are coming forward from the major countries of the world such as Japan, Germany the U.S., South America, England, Scotland, Australia, France, Taiwan, Bulgaria, Russia and more. What countries have this technology? International diplomatic overtures involving electromagnetic weapons include the 1977-1996 Russian proposals to ban "new weapons of mass destruction using new technologies. The public theatrics of the Moscow Embassy microwave bombardment from 1953 to at least 1988 and the public broadcast of the Russian woodpecker signal broadcast in the 1970s, (see previous Cahra website articles) were diplomatic war games. The diplomatic protests (see Moscow Embassy section above) masked a bigger issue below the surface.

It is clear that this is a diplomatic form of communication. It is not clear to the general public when viewed as separate incidents rather than a fifty year history. The USSR was most probably protesting U.S. mind control weapons. Both the US and Russia officially deny that they have these weapons. **The fears about development of new weapons of mass destruction has already been reported by all of the recent Soviet leaders and yet this has been lost in the other major problems of the world.** (see Cahra website, International article.) One example; 1986, Jan.27. Pravda Editorial on Gorbachev's Programme of Nuclear Disarmament. BBC Summary of World Broadcasts. Part 1 The USSR; A.International Affairs;1. general and Western Affairs; SU/8167/A1/1. Lexis-Nexis.

"At this point it is appropriate to draw attention to the fact that the Soviet

programme has been drawn up with due consideration for the fact that the currently prevailing balance of forces in the world is to be maintained at all states of its implementation, but at an ever lower level. No threat to anyone's security will be created at any moment of its implementation." **They include in particular beam, radio wave, and infrasonic and genetic weapons which, in terms of their destructive potential, could be no less dangerous than already existing weapons of mass destruction.** As for the USA, which is the primary addressee of the Soviet proposals, a statement by President R. Reagan described by the Western press as 'cautious and carefully considered' has been disseminated there. Unfortunately, there has been nothing more than that so far."

If Gorbachev is unable to generate a response from the world about electromagnetic weapons, it is hard to imagine who would. A war or international incident may expose this classified secret. The break up of the Soviet Union was a world-shaking event but only approximately twenty Russian newspaper articles reported Russian electromagnetic weapons articles. And only a few of those made it into U.S. mainstream press as allegations and unsubstantiated reports.

A 1993 Defense News article contained factual earth-shattering information and even this was not reported in U.S. newspapers. (Jan11-17, 1993 titled, "U.S. Explores Mind-Control Technology, U.S., Russia Hope to Safeguard Mind-Control Techniques" by Barbara Opall. Defense News is a major defense publication. See Cahra website for full article) At the least, the lack of reaction by the world, reveals the political nature of electromagnetic weapons. The lack of reaction indicates that mind control is tightly controlled with classified treaties and negotiations behind diplomatic doors.

Since the break up of the Soviet Union, there has been a few articles on mind control in U.S. publications. The FBI was interested in using mind control on David Koresh, (see previous Cahra article) The public hardly reacted to a short article on Koresh and the FBI in U.S. News and World Report, Newsweek and Time

magazine.

In the early 1990s, the U.S. mainstream newspapers and journals reported on the Pentagon's 'new' electromagnetic nonlethal weapons program. The technology that has been classified for forty years was finally declassified (see U.S. News and World Report 7-7-97, above). The break up of the Soviet Union and lack of a fifty year enemy, created an opportunity for declassifying the least important electromagnetic technology.

The whole picture of a classified new weapon more powerful than the bomb has never been presented to the public in U.S. mainstream press. National security issues in mainstream publications are controlled by the CIA, (see Washington Post quote under National Security section above.) and the U.S. control of electromagnetic weapons will not reach the mainstream press. In addition, there will probably not be another significant event like the break up of the Soviet Union in the near future and the technology will likely continue to be developed out of the public eye.

In brief, Russia no doubt alerted the world in the above cited instances about electromagnetic weapons. Most governments in the world must know of this sophisticated technology, deny it officially and are working on obtaining it or have it. The world distribution of the atomic bomb can be used to make an educated guess as to what is happening under national security. Did Russia or the U.S. give this technology to their allies? There are many unanswered questions and much research that could be done. The public is in the dark and the use of the technology is most likely being controlled by global agreements and arms control detente'. Once this is public knowledge, change can take place. The technology can be used to save lives. Human rights abuses can stop. And the experience of the atomic bomb can be applied to electromagnetic weapon technologies.

[Contents](#) | [Top](#)

Not one person, even the most powerful, can stop it

It is doubtful that one person such as Gorbachev or President Clinton could stop electromagnetic weapons programs. President Clinton or any president would arguably not have the clout to face the intelligence agencies or the Pentagon over such a deeply entrenched program involving careers and billions of dollars.

[Contents](#) | [Top](#)

Missed opportunity for one world government

After fifty years, mind control technology is in the hands of many, mainly the intelligence agencies, the pentagon, defense corporations and scientific research centers. The 1993 Defense News article cited above stated,

"Known as acoustic psycho-correction, the capability to control minds and alter behavior of civilians and soldiers may soon be shared with U.S. military, medical and political officials, according to U.S. and Russian sources. .Therefore, the Russian authors have proposed a bilateral Center for Psycho-technologies where U.S. and Russian authorities could monitor and restrict the emerging capabilities."

The technology itself is so highly sophisticated that like the atomic bomb, only industrialized countries could produce it. Mind control is here to stay. It is only a matter of when it will be declassified and how? As Dr. Robert Becker, the two time Nobel prize nominee said, it may be too late to stop it.

[Contents](#) | [Top](#)

Classified electromagnetic arms race is over: U.S. won

There are no major enemies of the United States. **It is doubtful that the many countries of the world could agree and coordinate efforts against the United States. It would seem that the United States does and will have world control. This weapon would make it possible.** There are surely third world countries who have had mind control technology tested and used on them. This is a great area of research for an investigative reporter. There is no public knowledge, except for claims by Saddam Hussein. of use of

mind control weapons to cause a heart attack and more. (See Cahra website, human rights article). The CIA's history confirms the U.S. policy of 'policing the world'.

It is safe to predict that the next world war will be bloodless and silent. There may be no battles. The silent third world war will be over without a single bullet being fired.

Other countries would be less likely to cross the United States since the weapon is silent, unprovable and more powerful than the bomb. And if other countries tried to talk about U.S. mind control weapons, no doubt the U.S. could silence them, as a warning to others in the know. Nobody will talk about it because everyone has something to lose. Any victim will tell you, that they would not wish this weapon upon anyone. So everyone keeps silent. **Only the USSR publicly protested with electromagnetic weapons against the United States, since the 1950s up to the 1990s.**

The 'bomb' or electromagnetic weapon has never been dropped publicly like the atomic bomb at Hiroshima. Does China have mind control? They have electromagnetic weapons, (see nonlethal weapons article, Cahra website). Perhaps an incident with China may reveal this technology. Incidents, like the break up of the Soviet Union, even that, did not affect mind control international policy. **It is unlikely that a future incident will reveal electromagnetic mind control weapons, based on the Russian diplomatic protests via the Moscow signal, etc.**

[Contents](#) | [Top](#)

No political hot potato: world opinion does not significantly influence U.S.

The U.S. is in an ideal position. The public does not know about the weapon. If it is used there is no proof tying it to the U.S. and everyone knows not to talk about it or they may be the next victim. One of the many rumors is that Naval Admiral Boorda, who committed suicide, tried to reveal this technology and became a victim. (see strategy section above).

The U.S. has nothing to lose, nothing to fear. There is everything to gain in keeping this technology classified. A large bureaucracy supports and perpetuates its growth. There are crimes to cover up. The weapons are powerful intelligence tools which maintain U.S. superiority. **Victims can count on a continuing strong national security law in the United States.**

Government documents describe **control** of space, rather than a defensive strategy, for example. See Covert Action Quarterly, Number 68, page 35. The nonconsensual experiment and intelligence programs would be likely to expand. The U.S. is maintaining and broadening its global position today.

The United State's position in the human rights community: a powerful force

In the World Court, one country can bring charges against another, but the US is the superpower in the international arena and no country wants the wrath of the US against them. In the UN, the US is the superpower with the most clout, although this complicated relationship needs further investigation. The US has the most relative wealth and power in the world and countries are reluctant to speak out or criticize them in a meaningful or serious way. The proposed International Criminal Court of Justice is opposed by the United States and supported by most other countries. It may be an avenue for international justice in the future.

[Contents](#) | [Top](#)

Comparisons to the atomic bomb and biological weapons: a probable pattern of development and use

It requires a large bureaucracy to run programs involving thousands of victims, all over the United States and the world. Because many people are involved, it will be less important to the US government to keep this classified during the next 50 years. Russia and the US have this technology, it can be safely assumed, see previous Cahra articles. And the US is no doubt trying to control Russia's use of the technology. There

would also be classified treaties to control its use. By looking at chemical, biological and nuclear weapons, similarities can be drawn. Sacramento Bee 10-2-99 p. A28 stated that the Pentagon created an agency to counter the growing threat of doomsday chemical, biological and nuclear weapons with a budget of **\$1.9 billion** for 1999. **At least 25 countries have, or are in the process of developing these weapons, according to Defense Secretary William Cohen.** The classified electromagnetic weapons would most probably develop in a similar way.

Controlling the brain for military purposes is a physics problem and eventually other countries have or will figure out how to develop it. Like the atomic bomb, electromagnetic weapons will probably be declassified and used for beneficial purposes as well as for military use. Nuclear power and radioactive treatments for cancer have been some of the side benefits of the development of the atomic bomb. It is a comforting fact that the atomic bomb has been used in war only once. The technology to read people's thoughts, like the technology to make an atomic bomb will probably not be available to the general public. It seems likely that mind control electromagnetic technology will be used for military purposes and for applications to space and/or cyborg or robotics type research such as visual systems, motor functions and the development of classified devices.

An article in **the New Yorker, by Richard Preston entitled "The Bioweaponers" 3-9-98** has many parallels to the mind control and electromagnetic weapon technologies. The article describes how the second man in control of biological weapons in Russia in charge of 2,000 scientists and staff, Ken Alibek. **With the breakup of the Soviet Union he was part of a Diaspora of biologists to leave Russia because they had lost their jobs.** He stated that no one knows where they went, Libya? China? Israel? He works with the CIA and his information is classified. But it has been reported that the information is shocking. Again, with mind control technology, there may be parallels worth examining.

Bill Patrick is one of only two or three scientists still alive and active in the US with a technical understanding of bioweapons. He was a UN weapon inspector in Iraq and the Iraqi intelligence people harassed him for his work. He went to a Pentagon meeting on anthrax on the eve of the Gulf War and concluding that "these people didn't know what the hell they were talking about." Again, the parallel to mind control is that the technology use is being controlled by people with military interests and little practical experience. Patrick and Alibek have consulted and are friends. The article also mentions that President George Bush and Prime Minister Margaret Thatcher were briefed on Passechnik's revelations, (the first biowarfare defector in 1989) and they put direct personal pressure on Mikhail Gorbachev to open up the biowarfare facilities to a team of inspectors. **Similarly, top officials would know about mind control and electromagnetic technologies and are controlling its use.** Governments are not motivated to reveal this information and until they are caught, victims must continue to build their case and inform the public of the horrific nonconsensual experimentation going on today. It would be helpful if victims can find the top scientists in mind control technology.

[Contents](#) | [Top](#)

Electromagnetic technology, like the atomic bomb, is controlled by the government but has close ties with corporations and private enterprise

The top scientists and their affiliations illustrate the government corporation connections. Jeffrey T. Richelson's article "The Wizards of Langley: The CIA's Directorate of Science and Technology, 1986, Intelligence and National Security stated the following:

Even an 800-page history of the CIA, published in 1986, included only a few references to the Directorate of Science and Technology. Yet the history of the directorate is a key element in the history of both the CIA and the entire intelligence community. It has designed and operated key intelligence satellite systems. It is also responsible for a number of scientific advances which have been made available for medical and other purposes. The earliest suggestion that the CIA needed to make a concerted effort to harness science and technology for intelligence purposes came from the Technological Capabilities Panel (TCP), which had been established in July 1954 by President Dwight D. Eisenhower, in response to concerns about US vulnerability to surprise attack. Key members of the TCP were James R. Killian Jr. President of MIT and Edwin H. Land, President of the Polaroid Corporation. Killian chaired the TCP, while Land headed its Project Three, charged with examining ways of enhancing the nation's intelligence capabilities through technology. **The winner of the CIA's 1996 award for the**

agency's top scientist, John Craven, received the award for his work on three projects, microwave technology [for computers]. A second involved using laser beams for communication. The work presently done by ORS falls in three main areas. The remaining research generally has a dual-use potential, and is now frequently provided to other elements of the government or the medical and scientific communities. **The Directorate of Science and Technology was established because key presidential advisors felt it was imperative that the CIA properly harness the powers of science and technology for the acquisition of intelligence.**

The 1978 book National Academy of Sciences The First Hundred Years 1863-1963 by Rexmond C. Cochrane **lists the seventeen PSAC (President's Science Advisory Committee members under Killian.** They were top scientists of that time and it would be highly likely that the classified electromagnetic technology would be developed under PSAC policy. Here are some of the seventeen scientists and their affiliations. They may be important to this issue, Lloyd V. Berkner, President Associated Universities, Inc.; Detlev W. Bronk, President Rockefeller Institute for Medical Research, James H. Doolittle, VP Shell Oil Co.; James B. Fisk, Executive VP Bell Telephone Laboratories; Caryl P. Haskins, President Carnegie Institution of Washington; Edward M. Purcell, Professor of Physics, Harvard; I.I. Rabi, Paul A. Weiss, head of developmental biology, Rockefeller Institute; Jerome B. Wiesner, Director, Research Laboratory of Electronics, MIT Herbert York, Chief Scientist, Advanced Research Projects Agency, DOD Herbert Scoville, Jr., Assistant Director CIA.

The 1978 book Presidential Politics and Science Policy, by James E. Katz, page 57 stated "Killian advised the Central Intelligence Agency and represented Massachusetts Institute of Technology." Page 149? stated **"PSAC was given a broad mandate to evaluate and produce recommendations on weapons, strategy, and space questions by the White House.** Eisenhower charged PSAC and especially Killian with identification and organization of the goals of the space program." Science and government were interconnected from the 1950s on and may explain the alleged space research experiments, the overlap of radiation and electromagnetic experiments, and the alleged government-defense corp. connection to many of the victims.

Research was influenced by political connections. Here is one example, page 161 stated **"During his [President Johnson] administration, programs on heart ailments and strokes were accelerated because it was known that Johnson had suffered related maladies.**

Page 187 stated, **"Both the use of research programs and scientific advice had been used by previous presidents, yet this at least partially reflects the White house attitude toward the utility of research: the political payoff is more important than the actual substance of research."** The NIH, (National Institute of Health) has been involved in illegal LSD and Tuskegee experiments and could have easily been involved with electromagnetic experiments. the book continued, "The combination of personality factors which had encouraged the rise of lavish NIH funding began disintegrating with the death of Fogarty and .[President] Johnson was able to take advantage .to reduce the lobby's monolithic impact." Political power exerts pressure on science advisory committee work and decisions.

International science: the same national government and corporation scientists make international policy

William T. Golden designed the first Presidential Science Advisory organization for President Truman in 1950. Golden wrote the 1993 book, "Science Advice to the President" and stated on page 2, "The American conception of a science and technology advisory organization to the highest level of government has radiated to more than 50 countries, including all the major countries. The establishment of the Carnegie Group of science and technology advisers and ministers to the heads of governments of the G-7 countries (United States of America, Canada, United Kingdom, France, Germany, Italy, and Japan), Russia, and the European Community, responsive to a proposal in Worldwide Science and Technology Advice to the Highest Levels of Governments, has been a major coordinating event.

The Carnegie Group, sponsored by the Carnegie Commission on Science, Technology, and Government, first came together in February 1991, with D. Allan Bromley (Science Adviser to President Bush) and Juriy Ossipyan (Science Adviser to President Gorbachev) jointly chairing the initial meeting. .It has now held five meetings semi-annually in different host countries,." **Sheila E. Widnal is on the commission and is**

Secretary of USAF and affiliated with MIT while Walter A. Rosenblith, MIT, is a senior consultant. (mentioned in section below).

This is an example of the network of scientists who work on defense issues with the government, which has ties to the international level as seen above. Golden listed the President's Science Advisory Committee members and their affiliations, which are representative of corporations, universities and industry across the country. **John M. Deutch, ex-CIA director was a member in 1985-89 and is affiliated with MIT; Simon Ramo, co-founder of TRW, Inc., one of the world's largest technological corporations; Gordon J.F. MacDonald, is Vice President and Chief Scientist of The MITRE Corp.** Golden is also author of the book "Worldwide Science and Technology, Advice to the Highest Levels of Governments", 1991.

A case study: The Moscow Signal, microwave zapping of the U.S. Embassy

The following are excerpts from news accounts by Barton Reppert Associated Press Writer, Washington AP, entitled "Looking at the Moscow Signal, the Zapping of an Embassy 35 years later, The Mystery Lingers". **This is an excellent example of how the government handles national security and electromagnetic weapons.**

May 21, 1988. Thirty-five years after security officers first noticed that the Soviets were bombarding the U.S. Embassy in Moscow with microwave radiation, the U.S. government still has not determined conclusively -or is unwilling to reveal-the purpose behind the beams. Among the possible reasons put forward by experts: attempts by the Soviets to trigger eavesdropping devices, to interfere with U.S. intelligence-gathering operations or **to affect the health, minds or behavior of Americans working in the embassy.** Low-power microwave signals "continue to be detected" at the embassy, according to the State Department's Bureau of Diplomatic Security.

.Over the years, several studies to investigate potential effects of the Moscow radiation led to controversial results. In some cases, the projects were terminated over the objections of researchers. The United States has made a series of diplomatic protests to the Kremlin over the microwave situation, beginning at least as early as the Glassboro summit in June 1967.

The Associated Press examined 5,000 pages of declassified documents from the State Department, the Central Intelligence Agency, and the Pentagon under the Freedom of Information Act and interviewed dozens of current and former U.S. officials, scientific researchers, medical specialists and attorneys.

.Nevertheless, these key facts emerge:

.The U.S. government apparently has succeeded in fighting back lawsuits and administrative claims totaling about \$250 million brought by employees who were exposed to the Moscow radiation or their dependents.

-Some American scientists and medical specialists investigating the problem have been seriously concerned about a possible Soviet bloc lead in research on the use of radio-frequency and microwave radiation for "mind control" and other weapons applications.

-The declassified documents disclose that the bombardment of the Moscow embassy drew expressions of serious concern in the mid-1970s from two CIA directors-William E. Colby and George Bush.

May 22nd 1988

Health problems which have been reported among personnel working with electromagnetic pulse equipment include an unusually high incidence of brain tumors and liver diseases.

Donald A Myers, a CIA specialist on biological and health effects of non-ionizing radiation, prepared a memorandum which said, "Dr. Herbert Pollack, a State Department consulting physician, has found that several members of the embassy display symptoms that are non-specific but have been reported frequently in patients chronically exposed to non-ionizing radiation. Such symptoms include headaches, inability to concentrate and fatigue, as well as physiological effects including shifts in the ratios of various blood cells. "

Richard S. Cesaro, deputy director for advanced sensors at the Pentagon's Advanced Research Projects Agency, in an interview prior to his death two years ago, contended that **"in our experiments we did some**

remarkable things. And there was no question in my mind that you can get into the brain with microwaves. .If you really make the breakthrough, you've got something better than any bomb ever built, because when you finally come down the line you're talking about controlling people's minds,"

Nicholas H. Steneck, a U of Michigan history professor and author of a book, "The Microwave Debate," said[the State Department's secret genetic testing program carried out from 1966 to 1969 under the cover name of the "Moscow Viral Study."] the cytogenetic testing program "was set aside on the shoddiest and shakiest of grounds. .If nothing else, on the basis of that you do a follow-up study- you don't just crank it down."

Government officials .say one of the biggest lessons learned from the microwave problem was that it was a mistake to keep the radiation secret from most employees until February 1976. [There followed] .a series of administrative claims and lawsuits against the U.S. government by employees and dependents who alleged that they has suffered health injuries because of exposure to the Moscow beams. **To help defend itself against such legal actions, the State Department in 1976-78 funded a \$1 million epidemiological study of Moscow embassy personnel, carried out under contract by the Johns Hopkins U School of Hygiene and Public Health.**

Dr. Pollack, the State Department medical consultant, said that **"without that Hopkins study, State would be sitting in the soup, because there were about \$250 million in tort actions on the books. And every one of those has been withdrawn without a penny being paid."**

.The study released in Nov. 1978', concluded that "no convincing evidence was discovered that would directly implicate the exposure to microwave radiation by the employees at the Moscow embassy in the causation of any adverse health effects as of the time of this analysis."

[Several experts on non-ionizing radiation disagree such as] Steneck, who cited a variety of studies that have been done over the past few years .finding significant effects at very low radiation power levels."

Public disclosure of the Moscow embassy problem in the mid-1970s spurred a substantial increase of interest among U.S. scientists in the controversial area of low-level microwave biological effects. "It had an enormous impact on the microwave research field," Said Steneck, who spent six years studying the field for his book.

For years, most American researchers had assumed that any significant biological effects were thermal-caused by heating of body tissues. This viewpoint is reflected in the safety limit of 5,000 microwatts per square centimeter set in the current U.S. voluntary guideline adopted by the American National Standards Institute.

The Soviet Union, however, has a much lower safety limit of only 10 microwatts, stemming from concern with subtle behavioral and physiological changes as well as subjective symptoms which Soviet researchers have reported with chronic exposure at low power levels.

Over the past decade more U.S. scientists have started paying serious attention to athermal effects, particularly effects on brain tissue of low-intensity microwaves modulated at extremely low frequencies. Since the early 1980s, however, federal government support for non-ionizing radiation bioeffects research has declined markedly. W. Ross Adey, a leading researcher based at the Veteran's Administration Medical Center in Loma Linda, Calif., told a House subcommittee last Oct. 6 that current levels of government funding -now about \$7 million a year- are "disastrously low."

"There is reason to believe that this situation has arisen in part through a well-organized activity on the part of major corporate entities from the consumer and military electronic industries to discredit all research into athermal biological and biomedical effects," Adey said.

Louis Slesin, editor of Microwave News, a newsletter covering the non-ionizing radiation research field, said that "what is clear is that Soviet researchers are extremely interested in the effects of this kind of radiation."

Feb. 12, 1976: Secretary of State Henry A. Kissinger tells a news conference that **"this issue is a matter of great delicacy which has many ramifications."** He declines to go into detail.

Jan 4, 1977: A notice posted at the Moscow embassy discloses that about one-third of individuals tested have shown abnormally high white blood cell counts. It says the cause for this lymphocytosis condition is

unknown.

The lessons from this article are clear. As discussed above and for in-depth reading, see April 1979 a Senate committee print, made at the request of Hon. Howard W. Cannon, Chairman Committee on Commerce, Science and Transportation. The title is "Microwave Irradiation of the U.S. Embassy in Moscow, Review of its History and Studies to Determine Whether or not related Health Defects were experienced by Employees Assigned in the Period 1953-1977".

Chapter 9. Electromagnetic Technology

New articles on the technology

The following evidence supports the conclusion that classified technology to read your thoughts, and much more, has been developed.

Here is an example of how many scientists know of this technology but don't talk about it. It clearly shows how the public could be unaware of the development of this technology while many top officials ignore victims charges of human rights abuses and illegalities. US News and World Report 7-7-97 reported: "Moreover, medical researchers worry that their work on such things as the use of electromagnetic waves to stimulate hearing in the deaf or to halt seizures in epileptics might be used to develop weaponry. In fact, the military routinely has approached the National Institutes of Health for research information. **"DARPA {Defense Advanced Research Projects Agency} has come to us every few years to see if there are ways to incapacitate the central nervous system remotely,"** Dr. F. Terry Hambrecht, head of the Neural Prosthesis Program at NIH, told US News. "But nothing has ever come of it," he said. "that is too science fiction and far-fetched." The counter argument, of course is, why is Darpa, a smart, hi tech government agency wasting it's time by asking such a dumb question? Why are medical researchers worried that their research might be used to develop weaponry as stated above?

Social and ethical issues have also changed the course of neuroscience research. For example, the Sacramento Bee 2-22-99 p A-1 quoted Dr. Giulio Tononi, a neurobiologist at The Neurosciences Institute in San Diego. **"Ten years ago, it was not appropriate for a scientist to talk about consciousness because it was considered too elevated a topic that we really couldn't address. Now it's not taboo anymore."** The issues of religion are deeply embedded in most societies and ideas such as the scientific basis of man's world and the origin of man and the soul and questions of God have clashed in Galileo's time and today.

EEGs or brainwave have been studied since the 1920s. An excellent book, History of Neuroscience in Autobiography Vol. I, edited by Larry R. Squire 1996, is a good research tool for understanding the history of the parallel development of classified mind control. Page 582 described the general acceptance of consciousness as a biophysics problem. John Z. Young, a neuroscientist stated **"One example I quoted was the evidence of Libet et al. (1983) showing that there are electrical activities in the brain half a second before a person makes a conscious decision to move a finger. This clearly shows that actions of the mind depend on the brain and that is absurd to consider oneself as two separate entities."** In the autobiography section on Theodore H. Bullock, he wrote, "I was introduced to electroencephalograph (EEG) recording and evoked potentials by watching Warren McCulloch. (Please see previous Cahra articles on McCulloch)." Bullock described world wide conferences in the 1950s with the world class neurologists at the time. In describing brainwaves, Bullock stated, **"It's a jungle in there- a fascinating community of diverse species and interrelations-and, according to my intuition, the greatest reservoir of new principles yet to be discovered." ".I believe that these compound field potentials are information-rich in ways we have not learned how to assess."**

[Contents](#) | [Top](#)

History of the development of Russian electromagnetic research

Here is a summary of the overall picture of Russian biophysics research from 1930s to the present and will help in understanding the next two sections. This is excerpted in chronological order from the book, "Bioelectrodynamics and Biocommunication" by Ho, Popp et al, 1994, unless otherwise indicated. Please

refer to my website for further information on Vernadsky, Gurvich, Becker and Adey.

Gurvich concluded that the agent stimulating cell division was UV radiation. .mitogenetic radiation[MR]. Subsequently the same effects were discovered in many other plant and animal tissues.

In the 1930s, mitogenetic research had spread to other European countries with mixed results. The physical demonstration of the existence of MR was not possible before WWII; the 'Gurvich radiation' was therefore suspect. There were other reasons for its unpopularity: the disastrous consequence of Stalins science policy for biology resulting in the Lysenko affair) and the fact that, at the time, biological science became dominated by molecular biology, which made Gurvich's approach obsolete.

.In the Soviet Union this led to an intensification of mitogenetic research in the 1950s. **.maintain that the organism is able to act as an emitter and receiver of a broad range of electromagnetic frequencies and use these coherently for communication, regulation and internal structuring.** .Inyushin, who is also one of the pioneers of therapy by means of very weak laser irradiation, postulated, in 1967, that the main source of MR was the cell nucleus and that it was coherent-a notion that gave the field a new dimension.

Harold Saxton Burr of Yale U School of Medicine took up biopotential research in the 1930s.Burr and his coworkers found steady electric potential gradients on the surface of many different organisms which were characteristic for each species. Burr and his coworkers correlated changes of bioelectric potential to growth, regeneration, .However the work of people like Lund and Burr was almost completely ignored by fellow scientists. The reason was not only that the scientific climate of the time was not very sympathetic towards this kind of research

It was orthopedic surgeon at the Veteran's Administration Hospital in Syracuse, NY Robert O Becker that was to bring the field to the attention of a larger community of scientists. [Body Electric, a must read, excellent overview of military, science research of electromagnetic radiation.]

After the war many new electromagnetic technologies, originally developed for military purposes, became available to research laboratories. Among these were the microwave technologies that followed from the development of radar, the photoelectric multipliers used in bioluminescence research and the electronic transistor.

.One of the founders of biophysics, Boris Rajewsky of the U of Frankfurt am Main held that the main task of biophysical research was to apply physical thought and physical methods to biological phenomena and the elucidation of physical relationships in life processes. He investigated the effects of light and of electromagnetic fields on the intact organism and also made a contribution to the research on ultraweak bioluminescence. **He was convinced that living tissue reacts with 'uncanny precision to all physical influences.** [See Schwan's paper with Rajewsky below.]

However the 1940s and 1950s also saw the beginnings of a number of new developments. The next 30 years saw the accumulation of evidence for the solid state properties of biological systems.

Russian biophysicist Alexander S. Pressman **proposed the first modern hypothesis on the biological role of EM fields.** He also suggested that informational as opposed to energetic, interactions play a significant if not main role in electromagnetic biocommunication.

. The radar developments during the second world war were rapidly applied to therapeutic techniques from which the interest in the **dielectric properties of biological materials had its resurgence,**

1964. Dynamical Systems in Physics and Biology by Professor Norbert Weiner. "Many other considerations which have up to the present been situated in a somewhat shameful background, such as **the study of direct communication at a distance between nervous systems, possibly by some sort of radiative phenomenon,** are going to be subjected to a real trend in scientific examination which will not be corrupted by the unscientific assumption that we are dealing with phenomena with no physical correlates."

Paul Brodeur, author of " Zapping of America" mentions Vernadsky. Vernadsky was quoted in the first chapter of the 1981 Kaznacheev book, Ultraweak Radiation in Intercellular Interactions "**on the necessity of mastering the biological action of the entire electromagnetic spectrum.**"

.In a 1990 General Assembly of the International Union of Radio Science held in Prague, Ross Adey concluded that, "**It is no longer a matter of speculation that biomolecular systems are responsive to**

low level, low frequency electromagnetic fields. Not only is tissue heating not the basis of these interactions, but the many instances of responses windowed with respect to field, frequency and intensity set a rubric for their consideration in physical mechanisms involving long range ordering at the atomic level."

[Contents](#) | [Top](#)

Chapter 10. The history and scientific basis of mind control technology: more facts to support the theory that the key to consciousness has been discovered

Now scientists are studying the biology and physics of consciousness. Dr. J. . Perpich at the 1998 Mental Illness Conference featuring other speakers such as Vice President Al Gore, stated that "there are 80-100,00 genes of which half are devoted to the nervous system. Half! .The neurosciences are the last frontier of human biology." It would be logical to ask why scientists have discovered the code of life but not of the brain and it is not implausible that it could be a classified project for military purposes. The famous scientist Albert Einstein wrote a letter to the President of the United States telling him of new scientific discoveries that could be used for stopping Hitler. This led to the development of the atomic bomb. The idea of a classified mind control project is not far-fetched. Many scientists have discussed its importance, see previous Cahra articles.

The 1954 book "The Roger Adams Symposium" by Brode et al page 5, is a good example of the international level of science as follows. "So, when General MacArthur asked for a six-man scientific committee to come to Japan to advise him on the reorganization of Japanese science on a democratic basis, Roger Adams was the man who headed it. The committee spent a strenuous summer in Japan, visiting and studying both industries and universities. Their report to General MacArthur was so significant that a new committee of six, of which Roger Adams was again a member, was asked to come to Japan in 1948 to survey and report upon the progress that the Japanese had made."

The 1969 book, "Intellectual Migration" by Donald Fleming described the discovery of the atomic secrets and there is surely a similar story for the discovery of the code of the brain. It cannot be explained in one sentence but the evidence below supports this 'at first glance, crazy idea'. The evidence is convincing. Page 158,

In 1934 Szilard conceived the idea of a nuclear chain reaction producing a violent explosion and actually took out a patent on the process (partly secret and assigned to the British government). But he had not hit upon the right element for sustaining a reaction and everybody else learned of the discovery of nuclear fission in uranium. Szilard, who had settled in New York in 1937, now undertook a three-pronged campaign-to get English, French and American scientists to clasp a tight lid of security on their research in this field; to demonstrate that with uranium a chain reaction would really work; and above all to impress upon the American government the importance of getting an atomic bomb before Hitler. In this cause, he drafted and induced Albert Einstein to sign the famous letter of August 1939 warning Franklin D. Roosevelt of the possibility of such a bomb-the letter that triggered the (initially very modest) efforts of the United States in that direction. Szilard himself eventually became a member of the team at the University of Chicago that built the atomic pile, the device for producing a controlled chain reaction that he had envisioned from the beginning.

Like Einstein's theory of the atom, the theory of electromagnetic radiation began in the 1930s. I.I. Rabi, Nobel prize winner was quoted in a Washington Post 1939 article headline, "We're all radio stations, Columbia Scientists Report, All Atoms, in Humans or in Steel, Found to Emit and Receive Long Waves".

"Every living thing on earth is a radio broadcasting and receiving set unconsciously sending out and receiving long-wave wireless messages." Professor I.I. Rabi, Dr. P Kusch and Dr. S. Millman of Columbia University told the American Association for the Advancement of Science today that all atoms, whether part of the heart tissue of man or a piece of steel, constantly emit radio waves which can be detected and measured. Even death of an animal organism does not mean the stopping of activity, they said, since the atoms which form part of the living cell continue to emit radiation after the organism as a whole has

ceased to function. The Columbia scientists measured these radio waves from atoms for the first time and found them similar to the action of visible light though the waves are much shorter and can be detected only by delicate apparatus. The method was used also in exact studies of the nucleus of the atom. All nuclei of atoms and the particles which surround them spin much like a toy top. The spinning is irregular, the particles of the atoms jumping with the speed of light from one point to another. "The radio waves which we have studied are emitted when the atoms pass from one of these states to another." they said. In their experiments, the Columbia scientists measured these radio waves with an accuracy 10,000 times better than has ever before been achieved, by shooting particles of atoms at high speed between two magnets.

Rabi was chairman of the original Science Advisory Committee from 1953 to 1957 and a member of PSAC until 1968. He was assistant director of the MIT radar lab and worked on classified radar research during WWII. An article by Allan A. Needell entitled "I.I. Rabi, Lloyd V. Berkner and the American Rehabilitation of European Science, 1945-1954" stated that **"Following the war, Rabi, with J. Robert Oppenheimer, was among the most influential participants in the debate over the control of postwar American atomic energy policy."** The article continues,

"[Rabi was] chairman of the "Scientific Adviser to the Policy Council" of the Pentagon's Joint Research and Development Board (JRDB). Among its duties was to advise the service secretaries (after 1948 the secretary of defense) on issues of long-term planning as well as the implications of scientific and technological advances for military strategy." **"The advisers assisted the founders of the Central Intelligence Group (forerunner of the CIA) in staffing a scientific intelligence branch."**

The scientists in the 1940s up to the present have been strategizing on national security and science policy. Needell's article continues,

"One of four specific recommendations on intelligence operations made by the Rabi-led committee was to increase "the number of U.S. scientific personnel overseas, either as members of formal missions under the auspices of the Departments of National Defense or State, or through exchange agreements worked out directly with foreign universities. It also supported establishing close relations between the Office of Naval Research (ONR) and the so-called London Mission for the Exchange of Industrial Technology, which, renamed the London Science Mission in 1947, came under the jurisdiction of the U.S. State Department."

Top US scientists from the 1940s were monitoring scientific discoveries and no doubt knew of Russian developments of electromagnetic technology, especially in light of the microwave bombardment of the U.S. Embassy from 1953 on, see section below.

Needell's article continued,

In January 1949 President Truman formally approved National Security Council Intelligence Directive 10 (NSCID), which assigned to the Department of State "primary responsibility for the collection abroad for all government agencies of information in the basic sciences." Lloyd Berkner was named to direct a detailed study of science-related organization in 1949. Berkner began a survey of the "International Flow of Scientific Information" and enlisted the National Academy of Sciences (to which he had recently been elected) and its government service arm, the National Research Council. Berkner appointed Rabi to an advisory committee. Detlev Bronk selected Rabi to serve on the National Research Council Committee (NRC). **"The NRC committee quickly endorsed establishing and staffing science missions in major foreign embassies throughout the world."**

Needell continued,

"The Berkner Report was devoted to advance American national security interests. Berkner remarked in 1950 that **"while the unclassified portion [of the recent report] has been designed to stand alone, it should be considered as a cover for the classified section.** Although the secret section to which he referred cannot be located in State Department files, Berkner hints that science could be profitably tapped to accomplish the political goals of the United States and that "according to his proposal, the State Department would have a [scientifically knowledgeable] 'staff' or a monitoring function in relation to [our] diverse interests. Berkner explained, he meant that, while traveling, scientists could be briefed

prior to their departure and debriefed upon their return. "The debriefing," he emphasized, "should be handled carefully by scientists in such a way as not to suggest that the information is to be used merely in the nationalistic sense."

Needell's article concluded that

"Berkner and Rabi remained close associates on matters of national security for years to come. Each contributed to important studies for national security agencies. Instead, many scientists became concerned with promoting their influence within the U.S. government and, more generally, building an institutional framework for cooperation between government and outside experts. More fundamental was the deep commitment of American scientists to working, often in secret, for the government."

Rabi is one of nine scientists for the 1996 book "The Story of MRI" from Bar-Ilan University Press. The book jacket states, "Rabi played a key role in propagating the "new physics" [new quantum mechanics] to his American colleagues. **His 1937 discovery of magnetic resonance in molecular beams earned him the 1944 Nobel Prize in physics for his resonance method or radiofrequency spectroscopy.** Another of the nine scientists was Edward M. Purcell, a nuclear physics Nobel prize winner and the book discussed his government scientific advisory role.

A.G. Gurvich, founder of a leading Soviet school of biophysics made similar discoveries in Russia in 1920s and 30s. Vernadsky worked with Gurvich. Vernadsky quotes were used in Russian scientific journals. A famous Russian military slogan based on Vernadsky's work was "He who controls the entire electromagnetic spectrum will dominate the world". See Cahra website, EIR Special Report 1988.

To place some of these scientists who "deepened man's comprehension of the atom" in a hierarchy they received the votes by a Fortune magazine poll. Seventeen Nobel laureates chose among 74 Nobel prize winners, who might be regarded as "immortal". Rabi, Bohr and Schroedinger, mentioned in sections of this paper were clearly the top scientists of their time.

World class scientists form 1950s biology-physics groups: the Jasons, the phage group, Biophysical Society, Cybernetics Group and Teleological Society

Gregg Herken dedicated his 1992 book to "Isidor Isaac Rabi, physicist, patriot, science adviser" This book abundantly described the politics involve in the PSAC, a presidential advisory board. Here are a few telling excerpts.

The Jasons had their roots in a secret 1958 Pentagon-funded undertaking known as Project 137, an attempt by the Defense Department to attract new talent to the study of military problems. [were] given the code name Project Sunrise. (The moniker Jason, which the scientists themselves selected, apparently derived from the Greek temple appearing on IDA's (Institute for Defense Analysis) logo.) .it was agreed that while the task force would be headed

by Army Lieutenant General Alfred Starbird, Kistiakowsky and several Jasons would also be members. **To ensure that work on the [electronic] barrier remained, in McNamara's words, "high-priority, top secret, and low profile," the task for was assigned the misleading title "Defense Communications Planning Group."**

There are numerous examples of the classified scientific defense projects in the 1960s to the present time. Science advisors and top government officials are using national security to classified the conferences and meetings on what technology to develop and how to use it. **Rabi continued to offer advice and counsel to the government, including suggestions "to build bigger satellites and a warning to Secretary of Defense Robert McNamara not to use nuclear weapons in Vietnam in 1968".**

Sidney Drell, a Jason wrote the 1993 book "In the Shadow of the Bomb Physics & Arm Control.". He wrote this in his preface, page xii,

"The bonds between JASON members and the academic communities that were our home base were also severely tested during the Vietnam War years. On many campuses, working for a Defense Department that was "doing all those awful things" in Southeast Asia was de facto evidence of

evil deeds. With varying intensity, some were personally attacked-I was confronted on several occasions, and once thrown out of a classroom in Europe-for "supping with the devil." **Many defense consultants, including JASONS felt the strain of having to keep part of our lives secret and off limits to discussions and questions, while working with our students and colleagues in the very open scientific world in which we enjoy the full and open exchange of ideas and the public scrutiny that is traditional and cherished in our purely scientific activities."**

These examples are great illustrations of the mentality of that period. Detlev W. Bronk, on the PSAC wrote an article in Science Vol. 186, Oct. 11, 1974 and stated, **"It was the beginning of 12 years during which there was strong support of science by Presidents Truman, Eisenhower, and Kennedy."**

In the book by Herbert York, "Making Weapons, Talking Peace, A physicist's Odyssey from Hiroshima to Geneva", **York stated that the Jasons became a division of SRI and Mitre.** Jack Ruina who headed the NSA, was a Jason in 1964 and **"examined the possible impact of new technologies on national security."** **"Jason pioneered work in beam weapons of all kinds."** Nicholas Christofilos was a Jason and proposed ."Sanguine", constructing a very low frequency radio system for communicating with totally submerged submarines.

Dr. Herbert York, currently Emeritus of the Institute on global Conflict and Cooperation was heavily involved in government consulting in ARPA, among other government agencies. In an email to Dr. York dated 7-99, about electromagnetic weapons as described in the 1970 UN documents authored by the Russians (see Cahra website) and human experimentation, he replied in part,

"There has been much work since the late '50s on the production of EMP in nuclear explosions on and the effects of EMP on Computers, guidance systems and communications systems, and there have been attempts for more that twenty years to develop weapons using these effects against enemy missiles/aircraft. Despite a lot of work they have not been very fruitful. To my knowledge, there has been no serious work in the US on using EMP to "target the brain,."

But the question did not ask about EMP or electromagnetic pulse to target the brain. Time will tell if Dr. York is using a national security answer. It would seem so unlikely that a top science adviser would not know of a large program to develop emr (electromagnetic radiation) weapons as indicated by the history and large numbers of victims world wide presented in this paper.

In 1956 the Biophysical Society formed. It was oriented toward the study of radiation. Members included this long list of notable scientists. H. P Schwan, Otto H. Schmitt, Claude Shannon, ("The most powerful and pervasive development in communications in this century has been Shannon's discovery of information theory [in] 1948, excerpt from book, "Age of Electronics, Lincoln Lab Decennial Lectures" by Overage, 1962.) In an interview of Shannon by Omni Magazine, Aug. 1987, he stated, **".applying information theory to biological systems may not be so farfetched, because in his view common principles underlie mechanical and living things."**), Kenneth Cole, Alan Hodgkin, Norbert Weiner, MIT W. R Adey, UCLA, the James Watson and Francis Crick (discovery of DNA), Erwin Schrodinger, (founder of quantum mechanics),

Georg Von Bekesy and other actual or potential Nobel laureates.

There was also the **'phage' group of physicists and biologists** who met and discussed physics and biology in the 1940s and 50s. This group included **James Watson**, Leo Szilard and Hans Delbruck. The Fleming book described how Watson had read Schrodinger's book "What is Life" and discussions of physics and biology included notable scientists such as Salvador Luria, and Gunther Stendt.

Steven J. Heims wrote the book, "Cybernetics Group" and stated the following.

"Another group of physicists displayed their self-confidence after the war by invading the traditional domain of biology, proposing to unravel the code-script embodied in the genes as suggestion in Erwin Schrodinger's widely read book with the enticing title What is Life? (1944). A dedicated group of researchers who became known as the "phage group" formed around Max Delbruck and Salvador Luria and gathered in the summers at Cold Spring Harbor on Long Island: **they were as narrowly goal-oriented as the designers of the atom bomb had been during the war. In this group young researchers obtained the training and orientation that**

eventually led to the discovery of the structure of the DNA molecule and creation of the new discipline of molecular biology."

This would be worth researching further as these top scientists were discussing the ideas of the time.

Many of the same 'phage group' and 'biophysical society' scientists attended the Josiah Macy (CIA funded) conferences on neurology in the 1940s and 50s. Some of the conferences are still classified according to author Steve Heims. John Neuman, Norbert Weiner, William McCulloch, neurologist, John Lilly M.D.; the connections are numerous. **Dr. Lilly was Chief, Section of Cortical Integration, Neurophysiological Laboratory, Research Branche, National Institute of Mental Health. Lilly authored an experiment entitled, "Experiments in Solitude, in Maximum Achievable Physical Isolation with Water Suspension, of Intact Healthy Person," Psychophysiological Aspects of Space Flight, New York: Columbia University Press 1961.** Dr. McCulloch described a trip to Europe for the U.S. Office of Naval Research looking for medical discoveries and stated that Dr. Lilly was failed to show up. See McCulloch, Warren S.(1965)."Embodiments of Mind" M.T.T. Press.

Here is an excerpt from Heims, Steven.(1991). Cybernetics Group. MIT

Preface. "The subject of this book is the series of multidisciplinary conferences, supported by the Macy Foundation and held between 1946 and 1953, to discuss a wide array of topics that eventually came to be called cybernetics." Pg. 11. .included several mathematicians (Norbert Wiener, John von Neumann), engineers (Julian Bigelow, Claude Shannon), a neuropsychiatrist (Warren McCulloch), and a polymatic genius (Walter Pitts). **Some members of this group had proposed that their concepts useful in engineering and biology,**. For lack of a better collective name we shall refer to this group as the cyberneticians, although they would never

have used this term themselves. ."Fremont-Smith[Josiah Macy Foundation] was so cautious that I got the impression he was anxious to keep something private- **.Much later I learned of the CIA involvement, .(the Macy Foundation's records have not been open for researchers).** At the Macy meetings, as the unedited transcript shows, the political conditions were discussed explicitly from time to time. **Some participants were government consultants who worked on "classified" topics kept secret from other researchers; their priorities were such that they skipped attendance at the conferences whenever the government called.**

[Contents](#) | [Top](#)

MIT, Massachusetts Institute of Technology: a possible classified electromagnetic weapon technology location, similar to the Manhattan Project's, University of Chicago football field location

One research lead is the following. MIT's NPR (Neuropsychiatric Research) Associates included W.Ross Adey, Brain Research Institute, UCLA, Theodore H. Bullock, Gerald M. Edelman, Robert Galambos, David

Hubel, Seymour S. Kety, William H. Sweet (refer to experiment section above) and Paul Weiss. These are world class scientists exchanging ideas on a global level in the 1950s and 1960s.

And from Steven Heims, "Cybernetics Group" book, Pg. 256 ,here is a profound statement by Gregory Bateson, a famous anthropologist once married to Margaret Mead, (Mead also attended Macy meetings.). "I looked up Bateson in Sea Life Park in 1968. I had written to him in connection with my interest in the history of the Macy cybernetics meetings. His response was, **"There is certainly a piece of scientific history to be dug out of these meetings-I believe more profound and dramatic than The Double Helix."**

Pamela McCorduck wrote the 1979 book "Machine Who Think". This section increases the likelihood of a Manhattan Project, University of Chicago, under the foot ball field location for labs to develop the bomb, at MIT. Much more research needs to be done, but it is plausible.

Page 68. **They were all connected: Wiener, Shannon, McCulloch, Turing, von Neumann. They were connected by friendship, by proximity, by their fascination with the dawning possibility that tools were finally at hand for understanding at least some aspects of human thought, which up to then had frankly eluded anything but proof by assertion.** I don't mean that we can declare a direct lineal descendancy from one generation of researchers to the next. Turing, with his appreciation of the rich possibilities of organizational and functional comparisons between human brains and the computer-as opposed to comparisons at the cell level. **Those concerned [with the Information Processing Model] were open-eyed people-the Ratio Club in London, the Teleological Society, and the Macy meetings in the United States- all devoted to the mathematical analysis of the nervous system (and as Wiener notes, you cannot study the nervous system without studying the mind.)**

And again, from the McCorduck book is an example top scientists meeting in groups and discussing the brain. Page 66. He [John von Neuman] had joined in December 1944 with Howard Aiken, the Harvard-based co-inventor of the Mark 1 computer, and with Norbert Wiener the cyberneticist, Walter Pitts, the logician, and Warren McCulloch the neurophysiologist, to form something called **The Teleological Society, to discuss "communication engineering, the engineering of control devices, the mathematics of time series in statistics, and the communication and control aspects of the nervous system."**

In the 1988 book Embodiments of Mind, Warren McCulloch wrote on page 3, **"in 1952, I went to the Research Laboratory of Electronics at Massachusetts Institute of Technology to work on the circuit theory of brains.** Granted that I have never relinquished my interest in empiricism and am chiefly interested in the condition of water in living systems-witness the work of my collaborator, Berendsen, on nuclear magnetic resonance."

Christophe Lecuyer, Stanford University wrote in HSPS, 23:1 (1992), "The making of a science based technological university: Karl Compton, James Killian, and the reform of MIT, 1930-1957". On page 156 Lecuyer wrote, MIT's war effort brought a spectacular growth of research programs and the rise of Federal patronage. MIT's continued acceptance of federal sponsorship during the postwar years, along with the technological revolution and the general expansion in higher education at the time, accelerated reforms initiated in the 1930s. **These combined developments brought MIT to the forefront of the elite research universities, expanded its research budget and its graduate school, led to even greater emphasis on science in engineering curricula, to an enlargement of its field of activities and to the development of new science-based technologies on a grand scale.** These changes permanently eroded the boundary between MIT and industry.

Dr. Lilly was also present for the 1960s UCLA Brain Research Institute Conferences with Dr. Ross Adey and Dr. William H. Sweet of violence studies notoriety in Boston, Massachusetts. One conference was entitled "Conference on Neurobiological Basis of Behavior. May 1-14 1964, UCLA Institute for Brain Research. The book "Simulations of God, The Science of Belief" by Dr. John C. Lilly, 1956, describes his contact with L.J. West of CIA and LSD experiments. Dr. Karl Pribram, Stanford University Professor and author of the holography theory of the brain collaborated with Dr. Lilly It is easy to imagine the talk of classified brain research among those who probably had security clearances. (See Cahra website, code of the brain article.)

A possible scientific basis for the key to consciousness

"**Informational Bioelectromagnetics**" by David Copson, 1982 is an excellent book for understanding this topic. Even more importantly, the author states the possible scientific basis for the mind control technology. Copson noted the importance of Dr. S.J. Webb and "his 'expose' of exquisitely sensitive, bioelectromagnetic communication between precisely-controlled external millimeter waves with the very machinery of life in cells." He describes the 1956 formation of the Biophysical Society included Claude Shannon, Francis Crick who was the co-discoverer of DNA, Erwin Schrodinger, Georg von Besky and Norbert Weiner, to name a few, (See previous Cahra article, Code of the Brain). On page 236, Copson quotes Arthur von Hippel in *The Molecular Designing of Materials and Devices*. MIT Press, 1965. Dr. von Hippel was Professor of Electrophysics at MIT, recipient of the Presidential Certificate of Merit in 1948, fellow of the AAAS and more. "Since nature designs everything from atoms, we should be able to create with foresight any feasible kind of material and device if we understood the Periodic System in all its implications." "the intriguing concepts of biomolecular engineering and dielectromagnetics will be mentioned briefly." The former recognizes the possibility that biomolecules may be combined into materials in which the characteristics and performance are predictable from a knowledge of the molecular properties, particularly of their constants such as the dielectric constant, the semiconductivity, and related electrophysical properties."

The term dielectro-magnetic engineering actually arises from the two areas under discussion, dielectrics and electromagnetics. The dielectrics part of this is explained by the quotation that opens this chapter and suggests the kind of information in the Periodic System that Dr. von Hippel had in mind-a kind of electrical or dielectrical reaction to applied forces and processes, varying with the element. The author once observed that with a fully classified and utilized electromagnetic spectrum, one might select frequencies to satisfy defined requirements in a process. Then by resorting to the device which delivers this specific energy in the form required, one could obtain some truly sophisticated solutions to process problems." (Please note, this fundamental law of science could be the basis for mind control technology. See previous Cahra papers. This fundamental law of science has been stated by many others from 1940s through the 1990s.)

Copson continued, "The term dielectromagnetic engineering combines aspects of von Hippel's enthusiasm for the Periodic System of the Elements with the author's respect for the electromagnetic spectrum. It is then obvious that neither sentiment is justified fully without the other. The conclusion for education in the future is that the study of materials and electromagnetic energy interactions and especially of dielectric processes will need much more emphasis. As if to connect these lines of thought we have the fact that it was the early work in spectroscopy following Nils Bohr's dynamic model of the atom that established the basic physical terms of the Periodic System of the Elements."

The 1965 book "The Molecular Designing of Materials and Devices" by Arthur von Hippel included chapters on biology such as "Sensory Coding in the Nervous System" by Walter A. Rosenblith, Professor of Biophysics, MIT and attendee of the Josiah Macy conferences mentioned above. The physicists and biologists, neurologists and medical professions were exchanging ideas including electromagnetic radiation and brain interactions.

It be plausible that his work might have been applied to the biological applications of a theory of the brain, similar to Einstein and the theory of the atom applied to the atomic bomb.

Here is an email to the Bulletin Of Atomic Scientist, Frank von Hippel, Arthur's son in an excerpted email below asking about his father, "Maybe you can answer a short

question. Your father was quoted by David Copson in 1982 in "Informational Bioelectromagnetics". I am interested in researching how the government decoded the brain in a highly classified program beginning in the 1940s, for military, intelligence and

psyops purposes. Your father's basic theories on material science is slightly related If you would have any information on this." On 8-21-99 Dr. von Hippel's son replied . Here is an excerpt. " I am unaware of this controversy. I also doubt that my father would have been involved in any **psychological** research. But if you have any information that he was and can forward it to me, I will be happy to see what I can find out. Frank von Hippel Center for Energy and the Environment Princeton University" Victims cannot expect scientists to reveal national security secrets.

The book "The Cold War and American Science: The Military -Industrial-Academic Complex at MIT and

Stanford", by Stuart Leslie, 1993 stated that Arthur von Hippel was a German refugee and there were significant documents at the Rockefeller Foundation Archives on his work. Rockefeller Foundation was interested in his work and MIT offered him an appointment in electrical engineering in 1936, (page 190).

Fleming's book discussed Niels Bohr's interest in biology. Niels Bohr was a Nobel prize winner. **"He did not deny, he said in 1929, that biology was a 'fruitful' field for the application of physics and chemistry. Just as we do not need to distinguish, in principle, between the current in a water pipe and the flow of blood in the vessels, no more should we expect, beforehand, any profound fundamental difference between the propagation of sense impressions in the nerves and the conduction of electricity in a metal wire."**

Russia & East Block say nonthermal emr biological effects proven, U.S. says no

H.P. Schwan was a German scientist who came to the US under a military recruitment program after the war. He has worked at the University of Pennsylvania on numerous government contracts and was a major contributor to the first health and safety standards for electromagnetic radiation, established by the US government. **In Physical Properties of Biological Matter: Some History, Principles, and Applications by Herman P. Schwan, 1982. ".Rajewsky and I had published a paper on the conductivity of erythrocytes, reporting, for the first time, dielectric measurements on biological materials extending up to 1,000 MHz. [See above,Russian history section for Rajewsky]. I mention all of these things to indicate the decisive role that the Navy and NIH played. Navy support has been available to me, in one form or another, ever since 1947, and NIH support since 1952."**

The book continues, "While a young physics student, financial problems forced me to interrupt my studies until I found employment as an electronics technician at the Oswalt Institute for Physics in Medicine, now **the Max Planck Institute for Biophysics** cell membranes are not likely to be affected directly by microwaves since fields of interest can only apply potentials across the membranes that are vanishingly small in comparison with potentials needed to yield significant membrane responses. And significant responses of biopolymers require field strength levels very much higher than those causing undue heating. These arguments have not been directly challenged so far [not true, See Adey above]. Schwan has worked extensively in the biomedical engineering field. **He has claimed up to the 1990s that the nonthermal effects of electromagnetic radiation have not been proven. Schwan holds this opinion to this day. His March 22, 2000 email response to the issue of classified electromagnetic, neurological weapons stated. "I am not aware of military antipersonnel weapons using em radiation. There was alot of talk about it some years ago. I believe the potential for such weaponry is small since em radiation field strength decreases inversely with the distance square in the "distant" field."**

Many scientists such as Dr. Ross Adey, who worked for years at NASA's Space and Biology Lab, believe otherwise and experienced the cutoff of funding of his nonthermal electromagnetic radiation research early in his career and in the 1980s he made this comment to a congressional hearing. From AP May 1988 Moscow Embassy newspaper article cited under international politics section above.

"Since the early 1980s, however, federal government support for non-ionizing radiation bioeffects research has declined markedly. W. Ross Adey, a leading researcher based at the Veteran's Administration Medical Center in Loma Linda, Calif., told a House subcommittee last Oct. 6 that current levels of government funding -now about \$7 million a year- are "disastrously low."

"There is reason to believe that this situation has arisen in part through a well-organized activity on the part of major corporate entities from the consumer and military electronic industries to discredit all research into athermal biological and biomedical effects," Adey said.

Louis Slesin, editor of Microwave News, a newsletter covering the non-ionizing radiation research field, said that "what is clear is that Soviet researchers are extremely interested in the effects of this kind of radiation."

Schwan's theory is still officially endorsed in safety standards by the U.S. government. In light of lawsuits claiming cancer and other health effects caused by electromagnetic radiation, the government policy of

nonthermal effects of electromagnetic radiation makes sense. The U.S. military is the major funder and user of radar and electromagnetic technology. .

The scientific basis of the bioeffects of electromagnetic radiation at levels below heating of tissue is supported by many scientists but economic and political forces have changed the course of science and as a result the issue of health effects of electromagnetic radiation is controversial to this day. It can be shown that from the 1940s through the 1990s the history of electromagnetic research is based on theoretical foundations that are standing the test of time. (See International article, Cahra website). The 1979 excerpt by V.L. Issraelyan, Representative of the USSR to the Committee on Disarmament actually stated the following. **"Assessments quoted in international literature of the potential danger of the development of a new weapon of mass destruction are based on the results of research into the so-called "non-thermal" effects of electromagnetic radiation on biological targets. "**

Here is an example by A. S. Presman of Russia. The nonthermal effects of electromagnetic radiation theory is accepted in east block countries. A.S. Presman of the Department of Biophysics, Moscow University, Moscow wrote "Electromagnetic Fields and Life" published in 1970. He began his research on the effects of electromagnetic fields on living organisms in the 1950s. In the forward, Presman wrote "Experimental investigations and theoretical considerations suggest that EMFs can have a significant biological action only when their intensity is fairly high and that such action can be due to only one process-conversion of the electromagnetic energy to heat. **Yet there is an increasing amount of reliable experimental data which indicate that EMFs can have nonthermal effects and that living organisms of diverse species -.are extremely sensitive to EMFs".**

Presman included a quote by V.I. Vernadskii, 1926 in the introduction.(Please see previous Cahra articles citing Vernadskii as father of the Soviet Bomb). Vernadskii stated: **"Only a few of the invisible radiations are known to us at presently. We have hardly begun to realize their diversity and the scrappy nature and inadequacy of our knowledge of the radiations which surround us and pass through us in the biosphere, and to understand their basic roles in the processes going on around us, a role which is difficult to comprehend by minds accustomed to other conceptions of the universe." "We are surrounded and penetrated, at all times and in all places, by eternally changing, combining and opposing radiations of different wavelengths-from ten millionths of a millimeter to several kilometers."**

The book "Electromagnetic Fields" by B. Blake Levitt, 1987, is good overview of the controversy surrounding electromagnetic fields, from a health standpoint. Levitt is listed in Who's Who of American Women and her work most often appeared in the New York Times before her bookwriting. Page 387 concluded the following. **"The nonionizing band of the electromagnetic spectrum will probably turn out to be far more significant than anyone heretofore imagined. There is a distinct possibility, for instance, that entrainment phenomenon, resonance relationships, and other reactions to nonionizing electromagnetic fields will prove to be a critical, but hidden, variable in all scientific research."**

This is a complex topic and the facts are becoming clearer as the same patterns emerge. The facts are verifying the claims of victims of nonconsensual experimentation. Another independent source to substantiate the nonthermal theory of electromagnetic radiation is an article in Trial 8-90 page 32, by Bruce H. DeBoskey entitled "Non-Ionizing Radiation: Hidden Hazards". It summarizes the litigation surrounding prolonged exposure to NIEMR or non-ionizing electromagnetic radiation. This is a good reference article and it demonstrates the difficulty involved in court cases filed by victims. The article stated **"the potential for hazards from NIEMR has long been known to the industries involved." ".Some industries have been funding research designed to show the absence of harm to workers or the general public."**

The EMR, (electromagnetic radiation), nonthermal controversy is being handled by the government in the same way as the defoliant Agent Orange used in the Vietnam war in which there were charges by veterans of the health effects of Agent Orange for years. This is an example of the government's use of lack of scientific evidence to cover up the toxic effects of Agent Orange in order to avoid lawsuits. Time 8-9-93, p51 headline read, "Reversing previous finding, experts link Hodgkin's disease, among other, to the Vietnam-era defoliant." The article continued, ".A study by the Centers for Disease control concluded in the late 1980s that the link between Agent Orange and various cancers was too tenuous to prove. Only 1,000 of the 39,000 claims made would be paid out. Last week, a 16-member panel of experts assembled by the National Academy of Sciences Institute of Medicine.", a link to cancer was made. It has been an ongoing battle". **It was recently reported in the Sacramento Bee Nov. 1, 1998 p. A4 that there is proof that the U.S. military withheld information about possible links between Agent Orange and birth defects, and downplayed the defoliant's link to cancer.**

There are many more examples that could be given such as the history of the radiation victims fight for justice. The government is knowingly carrying out a policy in order to avoid compensation costs. The Vietnam veterans risked their lives in the Vietnam war and the U.S. government should be punished for the way that the agent orange vets were treated. The radiation victims were treated the same way and there is a lesson for the current victims. It is important to realize that victims must actively fight for their rights because for many reasons there is no help for this type of problem in our society today.

The medical community's use of nonthermal electromagnetic radiation effects

From Harlan Girard of the International Committee On Offensive Microwave Weapons, here are three medical conferences featuring electromagnetic technology. The first example has information on the website for NextMed2 is at <http://www.amainc.com/nextmed.html> [old link]. It is at Boston April 9-11, 1999 and the program chair is Cdr Shaum B Jones MD of DARPA or Defense Advanced Research Projects Agency. Lectures included topics such as "**The Inner Universe of the Mind, Insights from Neurobiology and Replacement Parts for the Brain**".

The second conference is ElectroMed99 April 12-14, 1999 in Norfolk Virginia at www.ece.odu.edu/~emed99 [old link] entitled **Nonthermal Medical/Biological Treatments**

Using Electromagnetic Fields and Ionized Gases. The conference description stated in part, "Electrical pulses with duration down to less than one billionth of a second but at voltages exceeding ten thousand volts allow us to explore and utilize

electrical interactions with biological cells without heating the tissue. The high frequency components in the ultrashort pulses have been shown to provide a pathway to the interior of cells. Pulsed, high power microwave and millimeter wave sources allow us to explore and utilize nonlinear processes on the molecular level, with the potential to modify molecular structures, such as DNA, selectively. **Harlan Girard pointed out, E. Postow of the National Institutes of Health was on the Program Committee of ElectroMed99. He was also editor of a tribute to H. P. Schwan,** see above, nonthermal controversy section.

Third, NIH (National Institute of Health) and the Air Force are represented at a workshop on "**Therapeutic Benefits of Electromagnetic Fields**". by the Bioelectromagnetics Society in Washington DC on Feb. 12, 1999. Speeches included "**The Use of MW Technology for Remote Physiological Measurements**", Henry Kues, PhD., Applied Physics Laboratory, Johns Hopkins University and "**Repetitive Transcranial Magnetic Stimulation in Treatment of Mood Disorders**", Andrew M. Speer, MD Senior Staff Fellow, NIMH, Biological Psychiatry Branche.

Example: We're All Radio Stations

New York Post

Friday, December 29, 1939

We're All Radio Stations, Columbia Scientists Report

**All Atoms, in Humans or in Steel, Found
to Emit and Receive Long Waves**

COLUMBUS, Ohio, Dec. 29 (AP).--Every living thing on earth is a radio broadcasting and receiving set unconsciously sending out and receiving long-wave wireless messages.

Professor L L Rabi, Dr. P. Kusch and Dr. S. Millman of Columbia University told the American Association for the Advancement of Science today that all atoms, whether part of the heart tissue of man or a piece of steel, constantly emit radio waves which can be detected and measured.

Even death of an animal organism does not mean the stopping of activity, they said, since the atoms which form part of the living cell continue to emit radiation after the organism as a whole has ceased to function.

The Columbia scientists measured these radio waves from atoms for the first time and found them similar to the action of visible light, though the waves are much shorter and can be detected only by delicate apparatus.

The method was used also in exact studies of the nucleus of the atom.

All nuclei of atoms and the particles which surround them spin much like a toy top. The spinning is irregular, the particles of the atoms jumping with the speed of light from one point to another. "The radio waves which we have studied are emitted when the atoms pass from one of these states to another," they said.

In their experiments, the Columbia scientists measured these radio waves with an accuracy 10,000 times better than has ever before been achieved, by shooting particles of atoms at high speed between two magnets.

Chapter 11. Progress

Progress has been made internationally where the US suppression seems to be less effective. Below are the milestones and preliminary analysis of the international remedies through treaties, human rights law and international law.

1. Beginning with the CWC or chemical weapons convention, reported by Barbara Hatch Rosenberg in Bulletin of Atomic Scientist Sept./Oct 1994 p45, Hatch Rosenberg stated that under "The Certain Conventional Weapons Convention (also known as the Inhumane Weapons Convention and by its full name, "Convention on Prohibition or Restriction of the use of Certain Conventional Weapons Which May Be Deemed to Be Excessively Injurious or to Have Indiscriminate Effects", international discussions are now under way that may lead to the development of a specific new protocols covering electromagnetic weapons;. **The current surge of interest in electromagnetic and similar technologies makes the adoption of a protocol explicitly outlawing the use of these dehumanizing weapons an urgent matter.** "An article on nonlethal weapons entitled, " A Fate Worse Than Death" **New Scientist, 10-18-97, p. 27, Dr. Robin Coupland of the ICRC or International Committee of the Red Cross , "believes nations need an international treaty that specifically covers the new technology. "**

[Contents](#) | [Top](#)

2. European Union Resolution on A4-0005/99, environment, security and foreign policy passed on Jan. 29, 1999

The **draft resolution** included the following section and is indicative that victim's allegations are getting through to officials. H. (c) **whereas there is mounting documented evidence, from as early as the 1960s, much of it from official and military sources, clearly indicating the potential of electromagnetic radiation to profoundly affect humans, positively or negatively, leading to the possibility of new medical treatments and/or methods for manipulation of human central nervous system, including brain function, and even high energy weapons."**

In section (4) of the draft resolution, there is an example of the actual use of the technology. **It read, "Hi-Tech Psychological Warfare arrives in the Middles East", Bulletin, 23 March 1991, ITV London News Bureau Ltd, quoting accounts from Iraqi troops explaining the negative psychological effects of the electromagnetic transmissions;"**

And section H (h) read, "whereas, with hindsight, it is clear that allowing the military to operate in secret had not protected their secrets from their perceived enemies, and has in fact enabled all sorts of excesses, including environmental and health ones, so that they have come to threaten the security they purport to provide, ." And most importantly to victims, section 15 (b) read, "**Calls for a Committee of Inquiry to investigate the very extensive research in this field, and in particular the multitudinous claims of victims of being exposed to various forms of electromagnetic systems and other so-called "non-lethal" weapons, to include in particular the claims of the women of Greenham Common, but not limited to victims within the EU, so that former Iraqi troops or others could at least be interviewed:"**

The relevant section to EU A4-005/99, which passed this years read, "27. **Calls for an international convention introducing a global ban on all developments and deployments of weapons which might enable any form of manipulation of human beings;**" It is posted on the European Parliament website at <http://www.europarl.europa.eu/>. Find activities, then click on Plenary Sessions, then click on Reports by A4 number, then fill in 0005.

3. Electromagnetic Weapons Summary: by Grattan Healy, Advisor on Energy & Research Green Group in the European Parliament: February '99

Electro-Magnetic (EM) weapons are one of the newest and most serious military developments in the world today. Enormous secrecy surrounds their development, which is helped by the fact that they rely on the complex physics of non-ionizing radiation and on bio-electromagnetics. They can be broadly broken down into two categories- those aimed at the environment and those aimed at living systems, or in reality the human central nervous system. In the case of the environment and those aimed at living systems, or in reality the human central nervous system. In the case of the environment, very large quantities of energy can be literally 'broadcast', like radio, to create certain special environmental effects- radical changes in the ionosphere to affect communications, and possibly even the weather, as well as reflection to earth to perform such feats as x-raying the earth to find underground installations, possibly large transfers of energy to power equipment, or to apply destructive forces anywhere on earth, including EMP effects (Electro-Magnetic Pulse, associated with nuclear explosions), and simpler tasks like submarine communication, using very long waves. **The more sinister aspect concerns the ability to use low energy density waves of particular frequencies and special waveforms to literally 'tune into' the human central nervous system (CNS), something that has been achieved in the laboratory, according to publicly available scientific literature.** This might be done on an individual scale, to temporarily or perhaps permanently alter psychological states, so as to elicit certain behaviours temporarily or perhaps permanently alter psychological states, so as to elicit certain behaviours from human beings. It is alleged that many victims have been tested involuntarily for decades now with this technology. It is also suggested that these weapons have been used in some actions, most especially the Gulf War and against the Greenham Common women in the UK. In this case they would have a mass effect, in that they are aimed at large groups. This use is sought not only by the military, but, alarmingly, by the police forces as well, clearly for the purpose of controlling unruly domestic populations. Once achieved, such a system might become irreversible, or unstoppable. The subject came to the attention of the Green Group in 1996, and we have slowly developed a knowledge base and large archive in this highly specialized area. Several special meetings culminating in a Foreign Affairs Committee Parliamentary Hearing have been held at the European Parliament as a result, and finally the Group managed in early January '99, with the help of interested Members in other Groups, to have Parliament pass a resolution referring very critically to this subject. **This subject also has very serious implications for standard setting for non-ionizing radiation, because the levels of exposure at which one can manipulate the human being are very low indeed, since it is the tuning and the waveform which matter, not the levels, which is the reason that Russian exposure standards are apparently 1000 times lower than the US standards.** Setting standards suited to the use of mobile phones and power lines, so as to avoid the long term health effects, while very desirable indeed, may not even be low enough to prevent the use of these weapons, and may even legalize their use, something the Greens must be very careful of, since we have been responsible for this subject to date in the European Parliament (Lannoye, Belgium and Tamino, Italy). Ideally, for now, we should exclude military sources, specifically weapons, as opposed to communications equipment, from EU legislation on non-ionizing radiation altogether.

It is worth comparing the standard setting processes for non-ionizing and for ionizing radiation, as they are remarkably similar. The military, via the International Commission on Radiological Protection (ICRP), played a major role in originally setting ionizing standards at ridiculously high levels burying or ignoring the science, leading to the need for continuous reductions in the acceptable exposure levels. Something similar appears to be happening with non-ionizing radiation, in that a very similar unelected 'independent' advisory committee (ICNIRP-International Commission on Non-ionizing Radiation Protection) has offered advice in this area, which is accepted blindly by the European Commission, despite the fact that, once again, much of the science is being ignored, and the precautionary principle, for some odd reason, seems not to apply. The fact that two of the US representatives on ICNIRP are associated with the military has echoes of the past, and is most suspicious. The focus of public attention so far has been a project in Alaska called HAARP (High Frequency Active Auroral Research Program), which is a massive 'array' transmitter designed to manipulate the ionosphere for military purposes- communications effects, earth x-rays, and possibly weather manipulation (despite conventions banning this). **But the range of uses of this basic technology is very wide, much wider than its predecessor, ionizing radiation (nuclear). The primary difference is that electromagnetic waves can be 'tuned' so as to have certain effects on living systems, whereas the 'chaotic' nature of ionizing radiation does not facilitate this and the result of exposure to it is normally direct damage only.** As stated above, scientists have been able to 'tune' EM to facilitate remote direct communication with the central nervous systems of living creatures, and they are of course especially interested in using this fact to manipulate human beings. According to their own official documentation, the military and the police themselves are planning to use these technologies to control populations. They were used in a crude form by the Soviets against the US Moscow embassy in the '60s with fatal consequences for the ambassador himself, and it is believed that they were used in what is called a 'superfence' against the Greenham Common women, and also to demotivate the Iraqi troops during the Gulf War. The Soviets tried in the 70s to prevent an arms race in this area by means of a Convention, but the US rejected these efforts, and has moved ahead very rapidly, also within NATO, into a dominant position. Unless this development is stopped, we are entering an Orwellian '1984' type scenario, which could potentially permanently transfer enormous power to those in control of the technology. **It must also be seen in the wider context of the on-sided arms race currently underway, where the US is re-arming, by continuing with "Star Wars", and is aiming to be totally dominant in 'Space Power' by 2020. Electromagnetic weapons play a key role here, alongside ABMs, lasers and particle beam weapons.**

Group Position: We are of course totally opposed to the development and deployment of these weapons. We regard the unsuccessful attempts in the 70s of the former Soviet Union to have these weapons controlled by a UN Convention as having been a major missed opportunity, which has now led to a new arms race in this field. We have sought to renew the attempt to have a Convention to outlaw these weapons and the research that lead to them, primarily that concerning external manipulation of the human central nervous system. We are alarmed that, already, the US is moving toward deployment of ABMs, in Alaska for example, in breach of the 1972 ABM Treaty (possibly arguing that the USSR no longer exists!), and is also developing weather modification weapons, which would breach the 1977 UN ENMOD Convention. Adherence to these existing Treaties is absolutely essential from our point of view.

Positions of Other Groups:

The focus for debate so far in Parliament on this issue has been provided by a report on the environment and the military, authored by Swedish Socialist and peace activist Maj Britt Theorin. She referred to this very sensitive matter in a rather passing fashion in her draft report, having met, during a Parliamentary hearing on the matter, some of the main activists on the issue, and having also apparently met some anonymous scientist. Enormous pressure was imposed on the rapporteur Mrs. Theorin, we believe via her 'scientific' advisers, and she opposed every attempt to strengthen the resolution on this subject. At some points the PPE divided, and important Green amendments were lost, such as our call for a convention banning the human CNS research!. The Left (GUE/NGL) followed the Socialists, while the Liberals were mixed, but helpful on this question to some extent. In the end, we achieved a quite remarkable Parliament resolution on January 28th, damning the US for not being willing to even come to discuss the matter with the Parliament, and in particular attacking the HAARP project in Alaska, calling for a Parliament STOA study on it, while also calling in rather vague terms for a ban on the manipulation of human beings.

Initiatives Taken by the Group:

Being a very difficult subject, as it is (or seems) so new and very technical, and seemingly science fiction, it has been necessary to move carefully and not too quickly. **We began in 1996 with two special Green Group meetings, one showing an excellent BBC Horizon documentary on HAARP, and involving experts like Dr. Rosalie Bertell from Canada, an Dr. Nick Begich from Alaska, author of the best-selling book on HAARP, as well as MEPs like Tom Spencer and Carlos Pimenta, to make Members aware that this was no science fiction.** That let the Parliamentary Hearing on HAARP and 'Non-lethal' Weapons in February last year, in the Foreign Affairs Committee. The culmination so far was the Theorin report, and the considerable success in adding references on this sensitive subject, by adoption of our amendments, and some by the PPE.

Future Plans:

Not much has happened since the adoption of the Theorin report and resolution, and changes in the Membership of the Parliament in June may be having to start again to some extent. However, the media have now started to take the matter more seriously since Theorin. The STOA study should be produced in the next year. Green Ministers will now be urged to act on the matter. The new group will have to face this new issue after the election to decide how to proceed.

4. There are steps forward and back, Dec/Jan 97/98 Nexus, p8 stated that "On 19 November 1996 something happened in Strasbourg, France, which could fundamentally remove many of the rights of patients. It had no public airing beforehand, and has been little reported on ever since. **After marathon discussions, the Committee of Ministers of 39 European Union member states adopted the Convention on Human Rights and Biomedicine. This allows for future drug use and other medical trials to be carried out on potentially huge numbers of people, possibly without their consent.** those particularly at risk include the mentally ill who are deemed not to be able to give their consent; those with diseases for which there is no "known" cure(i.e., AIDS, cancer, CJD); people who are in a coma; those needing emergency treatment; and, perhaps most worrying of all, children. Although the convention applies only to EU member countries, the US Food and Drug Administration (FDA) simultaneously, and very quietly, changed its rules to be almost identical to those of the Strasbourg Convention. These new rules also mean that some groups of people may be involved in medical research programs without their knowledge or consent. Under the guise of individual "protection", the Convention says that in certain situations "general interests" will take priority over those of individuals. There is even the provision for organ removal from a living person, without consent, for transplant purposes in "exceptional circumstances". Source: Doris Jones, What Doctors Don't Tell You, Sept.97).

5. The United Nations General Assembly has adopted this 1996 Resolution 51/37. Prohibition of the development and manufacture of new types of weapons of mass destruction and new system of such weapons. This resolution has interesting history that began in 1975. The Soviets first proposed this resolution and it has been up for debate with the United States ever since as the UN record reflects. In 1979, the Soviets specified what they meant by "new weapons of mass destruction" The list included " (c) Infrasonic "acoustic radiation" weapons. **They would utilize harmful effects of infrasonic oscillations on biocurrents of the brain and nervous system."** and **"(d) Electromagnetic weapons operation at certain radio-frequency radiations, which could have injurious effects on human organs."** Quote from United Nations and Disarmament: 1945-1985 by the UN Department for Disarmament Affairs. (1985) NY.

Here is more documentation from the UN. The next quoted four paragraphs are from the 10 July 1979 Committee on Disarmament 1-52, V.L. Issraelyan, Representative of the USSR to the Committee on Disarmament. "As a result of research into the effects of electromagnetic radiation on biological targets, **the existence of harmful effects of radio-frequency radiations within a wide range of frequencies on such vitally important organs of the human as the heart, the brain and the central nervous system may now be regarded as a firmly established fact.** Assessments quoted in international literature of the potential danger of the development of a new weapon of mass destruction are based on the results of research into the so-called "non-thermal" effects of

electromagnetic radiation on biological targets. These effects may take the form of damage to or disruption of the functioning of the internal organs and systems of the human organism or of changes in its functioning."

"As regards the possibility of devising technical means of generating electromagnetic radiation, many countries already have a highly developed technical base in the field of radio engineering and radio electronic. Powerful high-frequency generators, radar devices and other radio engineering installations serving various purposes have been developed and brought into use. The development of these means reflects a common trend in that efforts are being made to improve their characteristics, increase their efficiency and reduce their dimensions. Data available in the scientific literature show that the peak capacity of electromagnetic radiation generators has increased almost a hundredfold during the past four years alone. It is expected that, in the next five or six years, means capable of the directional transmission of electromagnetic radiation density in excess of known safety standards will be attainable in areas measuring dozens of square kilometres."

"It is therefore to be expected that, taking into account further achievements in science and technology, it may be possible in time to devise means of generating powerful electromagnetic oscillations whose parameters could make those means suitable for use as a new type of weapons of mass destruction."

"During the course of the discussion in the Committee on Disarmament of the question of the prohibition of new types and systems of weapons of mass destruction, Soviet experts as well as experts from a number of other countries adduced concrete scientific data and facts which convincingly demonstrate that, in view of the present level of science and technology in certain areas, it is scientifically justified to speak of the possibility of developing corresponding new types of weapons of mass destruction, and in particular those listed in the annex to the expanded draft agreement. **It is practically no long possible at the present time to dispute the fact that the possibility of developing new types and systems of weapons of mass destruction--the consequences of whose emergence are as yet difficult to foresee--exists, and that the problem of the comprehensive prohibition of the development, manufacture and stockpiling of new types and systems of such weapons is therefore a pressing one.**"

6. International Committee for the Convention Against Offensive Microwave Weapons 1998 Civil Court Case Dismissed and Appealed to the Inter-American Commission on Human Rights

Andrews Electromagnetic Field Litigation Reporter, Oct. 98 (www.andrewspub.com) reported "Human Testing Claims 'Too Vague to Confer Standing,' U.S. Argues". The article continued, "United States government attorneys say that a class action suit, allegedly on behalf of persons who have been unwitting subjects of government-sponsored radiation and electric and magnetic field exposure tests, should be dismissed because its 'vague allegations are insufficient to confer organizational standing.'" The government tells U.S. District Judge Gladys Kesler of Washington, DC, that not only does the plaintiff group appear to have only one identified member, but the allegations contained in its complaint are too speculative to support its claims that unauthorized testing has violated the constitutional rights of an untold number of Americans." On page 6, the article continues with ".The International Committee alleges that Girard, and others whom the group seeks to represent in the suit, have 'experienced symptoms which are consistent with exposure to biological process control weapons and microwave technologies. The complaint alleges that government agencies are compelled by a March 1997 presidential directive to develop regulations preventing nonconsensual human testing. **The government, in reply, holds that the executive order cited by the group does not have the force of law and, thus, does not confer a private right of action upon the plaintiffs.**"

JAMA, Journal of the American Medical Association, Vol. 277, No. 20, p. 1583, reviewed the March 27 memorandum by President Clinton. The article stated that "President Clinton has directed federal agencies to adopt stricter rules for the conduct of classified research on human subjects. The directive follows most of the recommendations made by a committee he appointed in 1994 to investigate radiation experiments conducted on unsuspecting people by the US government during the Cold War. In his March 27, [1997] memorandum, Clinton directed federal agencies to propose new rules that would require scientists conducting classified research on humans always to obtain

informed consent from potential subjects, to tell the subjects that the research is classified and explain what classification means, and, in most cases, to disclose to subjects the identity of the agency sponsoring the research. The rules also should require agencies to keep permanent records of all secret research involving humans, ." It is relevant to Girard's court case that the JAMA article continued with the following. "Clinton has directed federal agencies to issue a formal report annually on the number of classified human research projects and the number of subjects in each project." According to the Girard court case, this was not done.

As reported in Microwave News Nov/Dec 1998, p16, ".In September, a lawsuit brought by the International Committee for the Convention Against Offensive Microwave Weapons (ICOMW) was dismissed in the U.S. district court in Washington." "We were asking the court to enforce a presidential memorandum which bans involuntary research on human subjects," "The Philadelphia-based organization had alleged that the DOD and the CIA have conducted such experiments in their efforts to develop weapons systems using EMFs, lasers, microwaves and sound waves(see MWN, M/ J98). The judge ruled that the group did not have standing to bring suit because the people alleged to have suffered from such testing were not ICOMW members. She acknowledged that Girard himself was a member, but stated that his own complaints were "too generalized and nonspecific to support a complaint." Girard told Microwave News that the ICOMW could not afford an appeal. **Instead, he said, the committee plans to raise the matter with the Inter-American Commission on Human Rights.**"

The above case was dismissed and it required a large sum of money, out of the reach of most victims. It is interesting to note that **the court case cited a violation of the 4th,5th and 8th amendments to the U.S. Constitution. It also cited "Violation of Treaties and International Law". This included the Nuremberg Code, the Universal Declaration of Human Rights, the Helsinki Declaration, the ICCPR and the Convention against Torture.** The case is US District Court for the District of Columbia, ICOMW v US Case # 1:98CV00939.

[Contents](#) | [Top](#)

7. World Organization Against Torture USA October, 1998 Report on "Torture in the United States, The Status of Compliance by the U.S. Government with the International Convention Against Torture and Other Cruel, Inhuman or Degrading Treatment or Punishment"

This report is another milestone, thanks to the three years of lobbying efforts by Harlan Girard of the ICOMW. This report was prepared by "The Coalition Against Torture and Racial Discrimination, A Joint Working Group of Non-Governmental Civil and Human Rights Groups in the U.S., Compiled and Edited by Morton Sklar, Director, World Organization Against Torture USA The project to organize a working group of U.S. based civil and human rights organizations, and compile and issue a joint report on U.S. compliance under the Convention Against Torture, was made possible through grants provided by the Ford Foundation and the World Council of Churches". A partial list of individuals who contributed to this report were the ABA, ACLU, AI, Meiklejohn Civil Liberties Institute and many more. There were 11 chapters and over 99 pages. A copy can be obtained from OMCT Suite 400, 1015 18th St. NW Washington, DC 20036 tele, (202) 861-6494 and it is posted on their website at <http://www.omct.org/woatusa/CATreport/science.htm>. [moved: <http://www.woatusa.org/>]

The relevant chapter is chapter 10. Involuntary Human Scientific Experimentation. Here are the highlights.

"The 1995 Initial Report of the United States to the United Nations Human Rights Committee acknowledges that a number of Cold War era experiments involving the exposure of humans to radiation were conducted that would be in violation of the International Covenant on Civil and Political Rights. **It does not however discuss in any detail: .whether any steps have been taken to ensure that such experimentation does not take place in the future.**" The report then discussed radiation experiments and stated, ".**while high level officials were aware of the dangers and the ethical considerations involved, there was a consistent lack of effective regulation governing administration of the tests.**" This section on experimentation ends with the following two paragraphs.

"In summary, although the U.S. government has taken important steps to acknowledge some of the errors that occurred in the past involving improper human experimentation, very little has been done

to properly compensate those adversely affected by these experiments, and courts have refused to hold the government financially responsible for what has occurred in many areas not presently covered by legislation. In addition, full disclosure of improper experimentation still has not taken place, and the adequacy of safeguards to guarantee that these types of unlawful practices do not occur is still very much open to dispute."

"Similar concerns also are being raised about involuntary human experimentation involving new forms of classified research and testing of high technology military weaponry, including microwave and laser equipment. Groups working on these issues cite, among other evidence of the existence of these unauthorized testing procedures, a White house intergovernmental memorandum dated March 27,1997, establishing stronger guidelines prohibiting non-consensual testing for classified research, but suggesting, by implication, that this type of human subject research may, in fact, be taking place. **Because of the classified nature of these activities, it is very difficult to confirm or disprove that they are taking place. Given the serious negative impacts on non-consensual human subjects that classified research of this type is capable of producing, and given the past history of secret experimentation by the government, these allegations of continuing improprieties involving secret government sponsored human testing should not be dismissed without more thorough, impartial investigation.**"

8. The International Bioethics Committee IBC of UNESCO, Proceedings of the Third Session September 1995, Volume1 included the conclusion to chapter 1 entitled "Ethics and Neurosciences" by Jean-Didier Vincent, Director of the Alfred-Fessard Institute, ".**As a possible instrument of encroachment on human liberty and dignity, the neurosciences may also turn out to be a poisoned chalice on which the worst forms of ideology may thrive.** The purpose of this report is to examine in a clear-sighted way and without complacency, the hopes and risks involved and to issue a few warnings of an ethical nature."

[Contents](#) | [Top](#)

9. The medical profession and the effects of weapons, Excerpts from the Reports of the Symposium held under the auspices of the International Committee of the Red Cross Montreux, Switzerland, 8-10 March 1996

Human rights professionals are coming up with new ideas on how to deal with arms control. The March 8-10 -96 Montreux, Switzerland Symposium entitled "The Medical Profession and the Effects of Weapons by the ICRC, International Committee of the Red Cross included the following. "Mission Statement for the Symposium. .Attempts to limit the development, design and transfer of weapons have met with little success. **It is possible that the future will see epidemics of the effects of the weapons using acoustic beams or electromagnetic waves. These weapons are being developed. It is not known how their effects can be treated.** .A framework for negotiation is needed to which both military and humanitarian arguments can relate. A primary consideration of the effects of weapons in terms of health provides just such a framework. .Conclusions.The participants agreed that to study and communicate the effects of weapons on health both present and future was primarily the responsibility of the medical profession. .the global epidemic of the effects of weapons should be viewed as a public health issue; **the effects of weapons on health provided an objective means of communication and a common language among doctors, lawyers, scientists and military decision-makers; weapons of the future should be assessed in terms of their effects on health;** .Recommendations of the Symposium **.2. a special meeting should be convened to establish the means whereby the effects of weapons on health, including their psychological effects, can be objectively assessed to facilitate a proper balance with military utility; this meeting should also address means of assessing the effects of future weapons.**"

The 3-16-96 Lancet, Vol. 347, p. 749, gave a positive review of the Montreux conference. The article stated that "the first hurdle to overcome is the popular misconception that the methods, means and targets of warfare are unlimited. **In fact, targeting of civilians is illegal under international law, as is the causing of "superfluous injury" or "unnecessary suffering to combatants."** **It discussed the importance of the organization WHO, World Health Organization "with its mandate to monitor and publish international public-health trends, is the only agency capable of mobilizing the necessary resources"**. There is a need to collect epidemiological data on the public health aspect of the effects of weapons. The article concluded that "the time for coordinated and robust clinical involvement in prevention's has begun".

10. Russian State Duma Expert Yuriy Lopatin Calling for Legislation Banning Illegal Development and Sale of Mind-Control Devices Excerpt form the "Man and Law Program, Moscow Russian Public Television First Channel Network in Russina 1610 GMT 6 Oct 95. This report was distributed to several government agencies such as Lawrence Livermore lab and Wright Patterson AFB. It is an unclassified FOIA response and the whole excerpt is below.

"Program includes a 5-minute report over video by Uriy Vorobyevskiy on Psychotronic weapons. Report opens with footage of Branch Davidian Siege and the claim that FBI has used a psychotronic device developed by Moscow scientist Igor Smirov. Video includes footage of Smirnov's laboratory, interview with Smirnov on possible uses of psychotronic technology; footage of special-troop recruits under instruction said to have been filmed at MVD Research Institute; interview with Aleksandr Kachurov, member of Moscow Psychotronic Institute, who says psychotronic devices are available to people who are willing to pay for them."

Chapter 12.

Strategies for victims: fighting back

Research and organization is making a difference. Here are possible strategies for the future effort to stop this human rights abuse. This issue has been closely studied and victims are learning much from the process, so that a solution to this problem will occur in this generation. There is a tremendous amount of information to be gathered on this topic. And the information has solidified the claims. Some of the newly found information is below and the evidence continues to support victim's claims. Victims who allege government harassment and targeting with electromagnetic weapon technology have been ignored and discredited. Government documents are classified and any sophisticated electromagnetic warfare signals used on alleged victims are difficult to detect. It is a Samson and Goliath analogy. But victims are networking, organizing and fighting back.

Professionals are scientifically studying the cluster of symptoms common to most victims.

CAHRA is sponsoring the Dr. Rosalie Bertell Project and has started a preliminary study of the medical claims of victims. Dr. Bertell has a doctorate degree in Biometry, the design of epidemiological research and the mathematical analysis of bio-medical problems. Currently, a medical doctor working under Dr. Bertell is reviewing victim allegations in order to design a larger study. Dr. Bertell is highly qualified and is active in the international peace community to this day. For example, she has worked on the International Medical Commission -Chernobyl which investigated violations of human rights of Chernobyl victims. The Preliminary Study on electromagnetic technology human rights abuses will be released on November 1, 2000. Please see CAHRA website for details.

1. There is no solution but many approaches towards the goal.

Here is an example of hard work and progress short of victory. The outcome was still worth it. California Representative Ronald V. Dellums wrote an excellent 1983 book "Defense Sense, Search for a Rational Military Policy". He held hearings on defense policy and an alternative military budget. It failed but opponents treated it as a serious challenge to the status quo. Participants included Hon. J William Fulbright, Dr. Michael T. Klare, Dr. H. Jack Geiger, Dr. Herbert Scoville, (See Scoville, CIA work above) and more.

[Contents](#) | [Top](#)

2. Information the public needs to know

A grassroots effort is one way to overcome governmental obstacles. The public has much to benefit from learning the facts. Their children's future may be affected, and now that there is proof of victimization of people of all walks of life, including children. There is more reason to be concerned about the unaccountability of classified research. The government is not using this technology to

improve health and save lives. They are developing weapons and using huge amounts of tax dollars in the process. Victims report

a set of symptoms over and over and their descriptions points to a technology in which the mechanisms of hearing and sight have been discovered and perfected. This technology could be used to overcome deafness and blindness.

Victims report sophisticated manipulation of their memory functions and agree that the mechanism of memory processes have been deciphered. This could be used to help Alzheimer's patients. Every nerve of the body can be controlled remotely and this could be used to block pain in chronic back pain cases or terminally ill cases. An article entitled "Attacking tumors with robotics and missile technology" in Biophotonics International, Sept/oct95,p22, demonstrates that this use of military technology is being used in civilian situations. The article described ".a new procedure that blends high-precision robotics with 3-D imaging and missile-tracking technology. Called computer-mediated stereotaxic radiosurgery (CMSR), the techniques uses agile robotic arms and powerful x-ray machines to safely destroy any cancerous tumors. .the system delivers short pulses of high-energy radiation.so accurately that healthy tissue surround the tumor remains undamaged." The conversion of military technology for civilian use needs to be expanded.

[Contents](#) | [Top](#)

3. Research and collecting information is important

Writing Freedom of information act requests and compiling important information is worth the effort. There are many leads to follow. For example, Financial Times, Nov, 30 1999 reported

"Pretoria- The SA Defense Force (SADF) was involved in highly secretive research in the early 1990s into changing people's brain functions, the Pretoria High Court heard yesterday. Jaap Cilliers, counsel for the apartheid government's chemical warfare expert Dr. Wouter Basson, put it to former SADF surgeon-general Niel Knobel that the research "terrified the world" because it was feared it could be abused to permanently alter people's brains to make them passive or aggressive.

Knobel said he had been aware that highly specialized equipment was imported for AIDS research and knew this equipment was also used in research on substances to incapacitate crowds, including the drugs mandrax and ecstasy. However, he found it difficult to comment on claims by Basson that the same equipment was also used in studies on altering brain function."

There are important questions to be answered. For example, under what government agency are the experiments taking place?

Victims have attempted to determine under what government agency the experiments are taking place. Given their history, the CIA and DOD, or department of defense are likely agencies. High security, very sophisticated equipment are the limitations to locations and it is likely manned locations on military bases. A few inquiries have shown where the experiments are not conducted. Dr. Joseph G. Perpich, grant director of the Howard Hughes Medical Foundation, replied in an email dated 10-22-98 that **"I do not know of any classified experiments in the neurosciences, and I do not know where one can direct inquiries regarding the same."**

On March 27, 1997, President Clinton issued the memorandum on "Strengthened Protections for Human Subjects of Classified Research. On Feb 4, 1999, in response to a question "Does the Department of Defense conduct or contract out classified research? Dr. Edward M. Land, Office of the Deputy of Defense (Science BioSystems Division, he is the director of human subjects committee for the Department of Defense) stated,

No, the March 1997 memorandum which stated that all agencies conducting classified research involving human subjects had to meet certain specifications and requirements as stated in the memo or discontinue all classified research one year from the published date of 27 March. The DOD complied and stopped all research that was classified and involved human subjects. The new "interim final rule" for classified research involving human subjects was presented to the federal agencies last Friday(1-30-99). This rule is out for public comment and will be on the OPRR website in the future or the NBAC website. .If the DOD funds or sponsors 'extramural' research, the private contractor

must meet all regulations that the DOD facilities must meet. They must abide by the Federal Common rule and any other regulations that govern their project." President Clinton's memorandum was issued to several departments for compliance including Director of Central Intelligence and the Secretary of Defense.

Since the experimentation continues to this day, according to victims, it would be likely that the government agencies have classified special access programs and are breaking the law again, as occurred in radiation experiments. This quote was from Bulletin of Atomic Scientist, Sept/Oct 1994 p 43.

"Special access programs employ security measures that are draconian compared to ordinary classified programs." stated Cong. Patrica Schroeder, .who chairs the House Armed Services Research and Technology subcommittee. [She] mentioned at a recent hearing that she'd asked the Defense Department for a list of special access programs and their costs. Her request was turned down. **Anita Jones, the Pentagon director of defense research and engineering, claimed that providing the list to Schroeder-whose subcommittee must authorize spending for such programs -would be too dangerous to national security."**

And a final example from the National Institute of Mental Health, NIMH, Dr. Henry Khachaturian, Public Information Office on 1-27-99. **"To answer your question, the NIMH does not support research on "behavioral weapons." The NIMH does not contract out, sponsor, conduct, or support classified research."**

[Contents](#) | [Top](#)

4. One person made a big difference, a milestone for the cause

The international approach to this problem has been helpful. Nick Begich has consulted extensively on the HAARP,(High Frequency Active Auroral Research Program of the U.S. government) with the European Union. He has clearly demonstrated how one person who cares, can make a tremendous difference. Defense News Feb 16-22, 1998 p3 discussed his work. It stated ".Nick Begich, a native of Alaska who co-authored the 1996 book, "Angels Don't Play This HAARP," told the European Parliament at the Feb. 5 hearing that while the initial experiment does not have sufficient power to be used as an electronic jammer or satellite killer, the U.S. military no doubt intends to follow up on work to bolster its capabilities. .Begich has studied the project as an independent ecologist since its inception in 1990, and referred the parliamentarians to an unpublished 613-page compilation of a 1991 HAARP workshop held at Hanscom Air Force Base, Mass, known as Technical Memorandum 195." **"The construction of such a device, Begich said, "may well be a legitimate military goal and requires confidentiality. But how it is to be used should be open to debate. That transparency is not there. HAARP must be evaluated by independent scientists."** Please see the new EU resolution listed under CAHRA table of contents and it's application to mind control victims. Informing professionals and influential people who can help is worth the effort, especially since our case is getting stronger.

[Contents](#) | [Top](#)

5. Political, financial and international pressure, an important tool to be developed

Another tool that many human rights groups use is political, financial and international pressure. The Sacramento Bee Feb. 17, 1999 article page A8 is a classic example that electromagnetic victims can follow. Entitled "German Businesses back WWII Compensation Fund", it stated that "The German government announced Tuesday that 12 of the country's largest banks and businesses will contribute money to a new fund designed to compensate hundreds of thousands of workers, mainly from Eastern Europe, who were enslaved by the Nazis during World War II. **The formal pledge to establish the fund, which is expected to be worth at least \$2 billion and possibly much more, follows months of intensive talks to head off a flurry of lawsuits that threatened to conflict serious damage to Germany's largest corporations and disrupt their expansion plans in the United States."**

U.S. News & World Report, July 10, 2000 page 24, an article entitled "Pieces of a tragic wartime puzzle stated, " With each cache of secret documents unsealed, **evidence has mounted to support**

the view that the Allies knew about the atrocities and as early as 1942 had solid intelligence on the death camps. More that 400,000 newly declassified documents released at the National Archives last week reveal fresh pieces of this historical puzzle that make the case even stronger. .While the Jews's destiny may not have been a top priority, **U.S. intelligence clearly tracked the Holocaust.** The victims of terror speak eloquently in the files of the OSS-the wartime forerunner of the CIA. **The documents trace the unimaginable cruelty and rigid indoctrination that defined daily life at the camps. .What is contained in the remaining 100,000 OSS documents still to be declassified by the CIA?"** The lessons are clear and understanding of human nature as history repeats, is important to victims who can attest to the severity of their torture.

An Economist, Dec. 5, 1998 article entitled "The World is Watching" gives an excellent detailed account of the human rights community today. One section is called "**The Power of Shame.**" Victims must use this important fact. Human Rights Watch, the largest U.S.-based human rights group has reported on the U.S. human rights abuse in a 506 page report on worldwide review of rights abuse(Sacramento Bee, 12-4-98). Amnesty International announced a campaign on the United States, to confront human rights abuse in the U.S. The US government has much to fear from exposure of their cold war secret, nonconsensual electromagnetic weapons testing programs and they will be unable to accuse other countries of abuses that they themselves are committing. Public reaction determines how much the U.S. will respond. This is an avenue for victims to investigate further.

It is important to give serious thought to the presentation of victim's plight and plea for help. Organizations such as the Federation of American Scientists, who include 55 American Nobel Prize Laureates and describe the private, non profit organization's work as analysis and advocacy on scientific and technical issues for global security, so far, will not investigate this issue. An email in Aug. 1998 from Dr. John Pike stated that the number of issues that they have the resources to work on is small relative to the possibilities. **While he felt that the victim's claims were based on adequately established technology,** there are hundreds of issues and FAS chose not to address this issue. Human Rights Watch, the International Committee of the Red Cross and Amnesty International, also have chosen not to deal with this issue, even with repeated requests.

Victims must find other approaches until there is one that works. Harlan Girard of the International Committee Against Offensive Microwave Weapons has tirelessly sat through meetings on the establishment of an International Criminal Court. Again, issues are complicated but Mr. Girard has made inroads and valuable contacts by presenting the issue in a factual way. Mr. Girard has networked with M. Cherif Bassiouni, the main force behind the establishment of the court. Bassiouni is a professor of law and author of the excellent book "Crimes Against Humanity in International Criminal Law. Basssiouni has extensively studied and written about the Nuremberg Code and its history in this book. In addition, he as written "**An Appraisal of Human Experimentation in International Law and Practice: The Need for International Regulation of Human Experimentation**" in the Journal of Criminal Law & Criminology, Vol.72, no.4, 1981 page 1597. These are essential reading if one is to understand international politics and experimentation law. The hope is that some day, illegal experimentation cases would be heard in the proposed court.

Victims need to be innovative in coming up with solutions. Here is an example of innovation by the government Of course this seems to be more of a token declassification of technology to satisfy public relations for the intelligence community. October 1999 vol. 286 of Science magazine, page 34 described the Medea Committee, **a panel of scientists modeled after the Jasons, a group of scientists who for decades have advised the government on issues relating to nuclear weapons technology.**

"This group meets regularly with the federal intelligence community to discuss how such disclosures can make important contributions to knowledge, without jeopardizing the nation's security."

[Contents](#) | [Top](#)

6. What can be done about the media problem?

Some things can be done such as contacting your local newspaper about the CIA connection and if they could reveal this information if they were aware of a CIA relationship to their newspaper. Contacting your congressman for a GAO, government accounting office investigation. Congressman have the power to request this type of investigation. There are GAO investigations of classified

material and a history of investigations similar to the electromagnetic weapon testing issue. GAO/T-NSIAD-94-266 is entitled "Human Experimentation An Overview on Cold War Era Programs" for example. Please note that the GAO stated that generally they do not review singular allegations in specific matters but it is possible that the GAO FraudNET will forward the suspected wrongdoing to an executive agency for appropriate action. (For more information, email to fraud.osi@gao.gov).

Because there are official reports from various professionals calling for an investigation of involuntary electromagnetic radiation experimentation (see Cahra website), a congressional hearing or staff report similar to the congressional hearing entitled "Is Military Research Hazardous to Veterans Health? Lessons Spanning Half a Century" is more likely to be approved at this time than in the past. It is plausible for the CIA Inspector General's office or the Department of Defense to investigate.

Finding the public official or professional who would be interested in taking up our issue is another strategy to work on. Prior to the 1990s, for the most part, victims worked alone but now they are organizing and the group effort has and will make a difference. The public would sign petitions, write letters of protest and support this issue, if they had the facts. The government will investigate if a case can be made and political and public pressure is organized. In reality, our system of government works in a certain way and victims need to plan accordingly.

A realistic perspective will make efforts and setbacks more understandable. U.S. News and World Report, Jan 24, 2000, page 5 illustrated the politics involved in government agencies. It helps to understand how the system works. This article discussed the reorganization of the Office for Protection from Research Risks and plans to move it out from under the National Institutes of Health. The article stated, "But now comes word of pressure to oust the office director, Gary Ellis, in favor of a candidate more protective of researchers. "They're trying to fire him for doing the right thing," says a Hill source."

Here is another example. A letter dated March 31, 1998, from Francis X. Brickfield MD, Chair Human Subjects Research Panel, CIA, stated, "I have received today your letter of 22 March 1998 requesting our procedure for opening a formal investigation into your allegation that the Central Intelligence Agency is conducting illegal classified experimentation on human subjects. I have forwarded your request to our Office of the Inspector General for action. That Office is responsible for investigating allegations of illegal conduct within this Agency, and will respond to your complaint." But there was never a reply, even after a call to the Inspector General. Victims must decide for themselves on how to spend their limited resources against a government with virtually unlimited resources.

Victims have written numerous letters to professionals and scientists but this has been a limited avenue of help. Freeman Dyson of the Institute for Advanced Study at Princeton is a physicist and was quoted in the Bill Joy article in April 2000 Wired Magazine on the dangers of technology. **Dr. Dyson coined the word "radiotelepathy", i.e. "something like a cordless phone inside your head" (see Cahra article, Code of the Brain). Dyson wrote this comment. "After the organization of the central nervous system has been explored and understood, the way will be open to develop and use the technology of electromagnetic brain signals."** This quote was from the International Herald Tribune April 25, 1997 page 4, entitled Imagined Worlds, by Rudy Rucker.

In reply to a question concerning classified brain research on March 18, 2000, Freeman Dyson wrote, " Nothing important in science stays secret for long. .The Russians had hundred of secret projects Luckily we are not so good as the Russians at hiding stupid stuff. **So stop worrying about imaginary scares. One of my friends .cures his patients with magnets. .But this had nothing to do with science."**

Dyson was a member of the elite Jason Division, the 40-odd leading scientists-including some Nobel laureates, -who in 1959 and 1960 banded together to work on national security matters in the summertime under the aegis of the Institute for Defense Analyses (IDA). Jason originated as an enabling mechanism to keep younger physicists in touch with defense problems, but it rapidly evolved into a club. "We were all bright young men together; we were all precocious 30 years ago," recalled Dyson. (Excerpt from Science, February 1973 page 460.)

And further, the April 2000 Wired magazine article on the peril of technology, (see future prediction section above) included a quote by Dyson;

Nearly 20 years ago, in the documentary "The Day after Trinity", Freeman Dyson summarized the scientific attitudes that brought us to the nuclear precipice: "I have felt it

myself. The glitter of nuclear weapons. It is irresistible if you come to them as a scientist. To feel it's there in your hands, to release this energy that fuels the stars, to let it do your bidding. To perform these miracles, to lift a million tons of rock into the sky. It is something that gives people an illusion of illimitable power, and it is, in some ways, responsible for all our troubles-this, what you might call technical arrogance, that overcomes people when they see what they can do with their minds."

Bill Joy, chief scientist at Sun Microsystems also wrote about Han Morovec, a robotic scientist and founder of the world's largest robotics research program, at Carnegie Mellon University mentioned in previous Cahra website papers. Morovec predicts man machine brain communication for the near future. And Sun analyzed Kaczynski's rant against technology, while Kaczynski is alleged to be a product of a CIA related psychology experiment at Harvard,(see 2000 Atlantic Monthly excerpt, this book, victim section). Sun discussed his meetings with Ray Kurzweil, the distinguished scientist who predicted mind machine computers by 2020,(see future prediction section above).

Joy discussed Arthur C. Clarke, who was privy to discussions about the Strategic Defense Initiative proposed by the Reagan administration. Clarke is affiliated with BT,(see future prediction section above), the British Telecommunications company working on the 'soul chip'. It is evident that these top scientists would know about the development of classified weapons such as a powerful mind control weapon. It insults the intelligence to think that top government, corporation consultants would not be aware of this powerful weapon. Most scientists discuss the amazing new technologies that interface with the mind but use the excuse of national security and do not address the underlying issues involved with weapons such as nonconsensual experimentation. The scientists who talk are killed, or lose government funding etc. (see this book, whistleblower section)

Here is what Joy wrote about information technology.

I have long realized that the big advances in information technology come not from the work of computer scientists, computer architects, or electrical engineers, but from that of physical scientists. The physicists Stephen Wolfram and Bros. Hasslacher introduced me, in the early 1980s, to chaos theory and nonlinear systems. In the 1990s, I learned about complex systems from conversations with Danny Hillis, the biologist Stuart Kauffman, the Nobel-laureate physicist **Murray Gell-Mann**, and others.

And here is what Science, Vol. 179 page 460 stated about **Gell-Mann**'s involvement with the Jason Division mentioned above.

Apparently this is a reference to a small study group including Gell-Mann which looked into Vietnam-related problems. Jason members say that there was no Vietnam work when they met at Woods Hole in 1965. But in 1966, some Jasons and other intellectuals, principally in Cambridge, decided to do something on Vietnam. Roger Fisher of the Harvard Law School .wrote John McNaughton of the Office of the Secretary of Defense in January suggesting an electronic barrier. Meanwhile a group of Harvard and MIT scientists suggested to McNamara that they establish a general technical working group on Vietnam and received his blessing.

It becomes obvious that top scientists and consultants are not going to reveal neurological electromagnetic weapons to the public but it is clear that they would be aware of its existence.

[Contents](#) | [Top](#)

7. Working on a legal solution

Understanding the legal system will help in formulating a plan for stopping nonconsensual experimentation. Understanding national security law, for example is knowledge that will increase chances of success. Vermont law professor Stephen Dycus has commented on the area 51 toxic tort case and the need for a special court to balance the needs of individual rights and national security concerns. He wrote a book on national security law, articles on international human rights and also the excellent book "National Defense and the Environment". He is one of the few to take the stand for balancing national security with individual rights, unlike the hundreds of government lawyers.

He is quoted in the Wall Street Journal Europe, February 12, 1996 entitled "Desert Storm: U.S. Air Base Broke Hazardous -Waste Act. Workers' Suit Alleges Washington Hits Claims Tied to Toxic

Disposal fires by Citing National Security. Plaintiffs Fear Retaliation" By Margaret A. Jacobs. The article stated that, "The government in effect argues that the national-security privilege -a form of executive privilege- **gives the military more leeway than the president has to keep information secret, even if it involved a crime.**" The article continues,

"The workers' attorneys have repeatedly asked Judge Pro, who once found that the government wasn't liable for injuries to 216 workers exposed to radiation at the Nevada test site between 1951 and 1981, to limit the material the government can restrict under the national -security privilege to truly sensitive information. In other privilege cases, the lawyers say, judges have segregated sensitive material and given the public access to the rest. A few courts have enlisted special judges with high-level security clearance or held secret trials rather than dismiss cases against the government", Vermont's Prof. Dycus says.

The article concluded with the following.

The Defense Department, however, claims to have properly asserted the national-security privilege. Though conceding that its position will result in some routine information about the base being withheld, **government lawyers argue that they can't acknowledge seemingly innocuous facts without creating a 'mosaic' that an enemy could use to figure out what the military considers a secret.** While Judge Pro hasn't ruled on the government's motion to dismiss the case, he has decided in its favor on most important issues including the 'mosaic' theory. Last month, he found that the government had properly refused to provide virtually all of the material sought by the plaintiffs and that the government had properly classified the manual. He also rejected without explanation the workers' argument that the government can't use the privilege to conceal evidence of a crime. Prof. Turley's office remains under seal and off limits to faculty members and students. He says his clients intend to appeal many of the judge's rulings. One important point, however, the workers prevailed. Last spring, the government disclosed that the EPA had begun inspecting Area 51, making it the first 'black' base opened to public inspection. **But, citing the privilege, the government refused to make the inspection report public, as required by law.** After the plaintiffs objected, Judge Pro ruled the government could withhold the report only if it got an exemption from the president. Shortly afterward, **President Clinton, who the same week publicly apologized to the victims of radiation experiment and who is opening up long-classified files about public exposure to atom-bomb tests in the 1950s, granted the exemption. His memo said keeping the reports secret was in the nation's 'paramount interest.'**

National security is more important than the human rights of Area 51 workers, according to the judge.

[Contents](#) | [Top](#)

8. A grassroots campaign; one avenue of many that victims can effectively work on in their search for an end to nonconsensual experimentation. There are massive problems. Government harassment and problems with secrecy.

The public should know of mind control and electromagnetic technology development and have a say on how it is used. But evidence indicates that they are not interested or may feel powerless to have any effect on the issue. It is a fact that people in the US are not politically active in terms of mind control and other issues. There have been American, Canadian, Australian, Russian and German TV programs about mind control technology, and there has not been a massive public protest. It would seem that the US government is also testing the waters. **There has been little public reaction so far.** Cynicism and the feeling that one cannot make any changes in a system of government that is growing every day may be some of the reasons for this apathy. The problem of mind control merits a response as in the 1960s response to nuclear, environmental and women's issues but it is not there. For these reasons, it seems logical to conclude that the nonconsensual experimentation will continue for many years, without major changes.

[Contents](#) | [Top](#)

9. Harassment in order to suppress information from the public

Scientists developing mind control technology were also under political pressure and loss of funding if they did not cooperate with the status quo. And scientists who have worked on unclassified but related research were also pressured in this way. See previous Cahra articles, on Dr. Robert Becker, Dr. Eldon Byrd and Dr. Ross Adey's loss of funding for electromagnetic nonthermal biological effects research. Tom Bearden is a retired army officer who has written books on electromagnetic weapons and is one of the few professionals to speak out about mind control technology. It was reported in Atlantis Rising no 12 by William P. Eagles page 18, that "Since the early 1990s, however Bearden has shunned any discussion of psychotronics(this is another name for electromagnetic weapons, see previous Cahra articles), mysteriously claiming reticence to be the prudent course for any man interested in 'staying healthy.'"

Paul Schaefer has a degree in electrical engineering from U of Missouri-Rolla who worked on nuclear weapons for four years for an Atomic Energy Commission contractor and was an activist. He died in 1999. He has written about harassment with hi tech electromagnetic technologies and there have been attempts to discredit him for his views. The Greenham Commons nuclear protesters also experienced electromagnetic harassment and mail tampering, threats and burglaries in the 1980s. See Human Rights Cahra article.

Here are two more examples in the nuclear industry. In 1981, the California Attorney General's Office assigned an estimated 10 percent of the agents in its Bureau of Investigation to a special task force on anti-nuclear activists. In 1971, PG&E attempted to discredit filmmaker Don Widener, who produced a television documentary highly critical of the nuclear industry's safety record(Nuclear California 1982 by David Kaplan p. 26). There are many more examples and this is one reason that the issue of electromagnetic radiation could be kept out of the public eye.

U.S. News and World Report, 4-14-97 p. 15 reported on CSETI's director, Steven Greer, a physician **"requesting the government to disclose whether there have ever been experiments in remote mind-control, alien cryptography, and other supersecret "unacknowledged special access projects."** On CSETI's website is Dr. Greer's letter of July 3, 1997 stating that he felt it was a strange coincidence that he and his coworker were stricken with cancer at the same time last year. His CSETI coworker has died. There are many more examples. This is a common phenomena in many different fields in which there are struggles for power. By demonstrating this pattern, it becomes more understandable in a field that people have not heard of, such as classified high technology.

This is an article listed on Lexis Nexis database, available at college libraries. As reported in the Intelligence Newsletter 10-3-96 Indigo Publications, a respected and expensive newsletter on intelligence issues, Admiral Mike Boorda chief of naval operations committed suicide. He is now known to have headed a secret body called the Strategic Studies Group,(available on the Internet), to study topics such as cognitive warfare. It cited an example of using electromagnetic force to produce speech in the human body, enabling covert suggestions to be planted in someone's brain. "The same techniques, say the experts could be used to prevent muscular movements, control emotions and actions, produce sleep and interfere with short-term and long-term memory." **The article states that Admiral Boorda was "deeply involved in a study on the possibilities of cognitive warfare, a form of mind control that uses acoustical, optical and electromagnetic fields or a combination of the three to interfere with the biological processes of an enemy, some lurid reports have surfaced that he was murdered because he was about to reveal sinister undertakings by the Navy in mind control and brain warfare."**

[Contents](#) | [Top](#)

10. Networking with other grassroot organizations

It is hard to convince people to deal with a problem that only indirectly affects their future. To the general public, the mind control issue is a problem that can wait. Mind control triggers thoughts of lunatic fringe, muddled waters with little evidence and fears of national security issues. This is what victims must overcome and find a strategy to deal with. An alternative is to ask people for donations to this cause. For example CAHRA is a non profit 501(c)3 organization. This is a small step that people can do and it would make a difference in the outcome of this issue.

Networking with other human rights groups such as Nukewatch and subscribing to their quarterly newsletter is helpful. There are books on the topic and the latest information on the Stop Project ELF Coalition, how to protest in an effective way. Contact nukewatch@win.bright.net or write Nukewatch,

P.O. Box 649, Luck, WI 54853. This grassroots effort has been used by groups such as the famous Project Censored, Sonoma State U in California, a media watchdog group. They have reported on the dangers of HAARP. See <http://www.projectcensored.org/> or contact director Peter Phillips at (707)664-2500.

The Berkeley Earth Regeneration Society headed by Aldon Bryan in Berkeley, California has been working for over 15 years on environmental issue with scientists such as Dr. Glenn Seaborg. At a recent conference in Berkeley, Dr. Bryan described his work as "starting at a grassroots level and working up". This group has worked with Congressman Dellums on legislation and a teachers association, and the AFL-CIO for support. They were recently successful in organizing the Rio conference on air quality, an international effort involving the UN. The internet is also a good grassroots tool for victims and seems to be less censored than major newspapers.

In conclusion, the long-term reality does seem to be bleak and the short term gains in grassroots work are still worth the effort.

[Contents](#) | [Top](#)

11. Innovation: in the end, victims must try anything that might work and is realistic

Ed Light, founder of the Mind Control Forum is a victim. He loves computers and applied his talents to fighting mind control. As a result of his informative world wide web internet website, The Mind Control Forum [[archived here](#)], the movement has grown. Eleanor White has used her many talents to further the cause in very creative ways. Please see her website at www.raven1.net. Electromagnetic weapons technology is in the hands of very fallible human beings. As a result, victims experience the down side of technology and are the real heroes by simply surviving.

[Contents](#) | [Top](#)

12. The approximately 500 victims who have contacted CAHRA have advice on how to survive this experience

- Go on with your life as much as you can
- Talk to as many victims as you can so that you will know what you are dealing with
- Don't spend money on travel and trying to escape it. This is world-wide. Not one victim has been successful by trying to run.
- Document what you can but don't spend needed funds; learn from victims who have already tried everything
- Be methodical when approaching professionals, don't loose your cool.
- Do what you are able for the cause but take care of your health and personal life first
- This is human nature at its worse, plan for the heartless psychological tricks and games by talking with other victims who have been through it
- Do what you enjoy, are good at etc, for the cause, if you are willing and able.
- Compensate in postiive ways for the torture you are enduring.

[Contents](#) | [Top](#)

Chapter 13. Conclusion: Main points and editorial comments

World-wide, victims describe the same set of symptoms: say torture is hi-tech , worse than ever

Victims are coming forward from all over the world with stories of hi tech electromagnetic torture. There are reports of nonconsensual experimentation, counterintelligence programs, political repression and mass population behavior control. Cahra has networked with over 500 victims since it was formed by three victims in 1996. Russia has counterpart organizations of thousands of victims and since the break up of the Soviet Union, mainstream soviet press has published numerous articles. A 1998 TV program provides a good description of Russian experiments and it matches U.S. victim allegations Entitled "Secret Russia", the program is Geheimes Russland (TV-Tagestip, Der Dienstag im ZDF: 22-12.98-22.15), described the following, "**Since the years of Soviet rule** people have spoken furtively in Russia of secret research and

experiments, which the Army and the KGB sponsor. "In the future are we going to be remote-controlled robots?"

[Contents](#) | [Top](#)

Technology has advanced but human behavior has not kept pace

Briefly, electromagnetic technology works on the theory that the mind and body are an electromagnetically mediated biophysics system and the electromagnetic signals from outside sources can mimic the mind and body's electromagnetic signals and therefore a weapon can be developed based on these principles. Microwave hearing is reported by many victims and is an intelligence tool, according to the many government documents. There has been Soviet and American interest in this weapon as described in the following article. The Federal Times, Dec. 13, 1976 article entitled "Microwave Weapons Study by Soviets Cited." stated, "The Defense Intelligence Agency has released a report on heavy Communist research on microwaves, including their use as weapons. Microwaves are used in radar, television and microwave ovens. They can cause disorientation and possibly heart attacks in humans. **Another biological effect with possible anti-personnel uses is "microwave hearing."**

There are numerous examples of the correlation of government documents with victims allegations from the 1950s to the present. Just one is the following. FOIA CIA 1959 MKULTRA, Subproject 119, "To make a critical review of literature and scientific developments related to the recording, analysis and interpretation of bioelectric signals from the human organism and activation of human behavior by remote means." There is abundant evidence of victims claims but the political will to stop this abuse is not there, just as in the case of radiation experimentation.

The twentieth century has been called the bloodiest century in the history of man. (See Cahra website nonlethal weapons paper). Human experimentation reflects this trend. There are now excellent books documenting the international history of human experimentation. Examples of the rationalization of government scientists who conducted horrendous experiments has notably occurred in the United States, Germany and Japan. Victims have now compiled stronger information to document a convergence of the complaints and allegations by victims for over 50 years, to the history of UN disarmament documentation and the development of electromagnetic technology and neuroscience. Here is one of the best articles on a classified electromagnetic weapons arms race. The International Review of the Red Cross 279, Nov.1, 1990, **"In spite of the rarity of publications on this subject, and the fact that it is usually strictly classified information, research undertaken in this field seems to have demonstrated that very small amounts of electromagnetic radiation could appreciably alter the functions of living cells.** The article further stated, **"Some research seem to have confirmed that low-level electromagnetic fields, modulated to be similar to normal brainwaves, could seriously affect brain function."** The article continues, **"Research work in this field has been carried out in almost all industrialized countries, and especially by the great powers, with a view to using these phenomena for anti-materiel or anti-personnel purposes."**

It is highly probable that the discovery of the brain is used for military and intelligence purposes and space exploration by the U.S. military and other major superpowers.

Victims are organizing. Dr. Bertell and a medical doctor are conducting a study of claims by survivors. The World Organization Against Torture, with funding from the Ford Foundation and several human rights organizations has stated that this issue deserves an unbiased investigation. The European Union has passed a 1999 law on electromagnetic technology that would manipulate human beings. **Not only the numerous uncounted survivors, but several independent professionals are putting their time and effort into this issue. Through facts, information and hard evidence, nonconsensual experimentation will eventually be exposed.**

[Contents](#) | [Top](#)

Human rights abuse in the United States: a fifty year cold war secret

The U.S. government does not want to admit that human rights abuse in the U.S. are as horrific as anywhere in the world. Political control and torture are now hi tech and computerized. **Instead of developing medical cures, this classified scientific discovery of the electromagnetic system of the**

brain and nervous system has been weaponized just as the secrets of the atom and DNA have been used for the atomic bomb and germ warfare.

I have no hope that the U.S. government will own up to the ongoing classified cold war abuses until they are caught red handed. The history of secret government experimentation and survivor's lack of response from the government would support this conclusion. New York Times Magazine, 8-31-97, page 38 stated: **"For decades, those who claimed to be victims of clandestine radiation experiments conducted by the United States Government were dismissed as paranoid."**

Eventually, the U.S. government will be unable to contain this issue; this is the pattern in the past secret radiation experiments and the Moscow Embassy microwave bombardment. When radiation experiments were exposed in 1993, the government dodged the lawsuits and President Clinton gave a feeble public apology knowing that current secret experiments are continuing to this day. To appease the public, the government settled a few of victims claims. There was a Clinton executive order regulating classified government research and in this act the public was sold the hope that radiation type experiments would never happen again. The hope is false. Harlan Girard's legal complaint alleged that "government agencies are compelled by a March 1997 presidential directive to develop regulations preventing nonconsensual human testing. **The government, in reply, holds that the executive order cited by the group does not have the force of law and, thus, does not confer a private right of action upon the plaintiffs."**

In comparison to the murders committed, the ruined lives, the profits of billions of defense dollars, this is an insult to victims. The irradiation of Moscow Embassy employees as reported in the 1988 AP article above is similar. Dr. Pollack, the State Department medical consultant, said that "'without that Hopkins study, State would be sitting in the soup, because there were about \$250 million in tort actions on the books. **And every one of those has been withdrawn without a penny being paid."** The study released in Nov. 1978', concluded that "no convincing evidence was discovered that would directly implicate the exposure to microwave radiation by the employees at the Moscow embassy in the causation of any adverse health effects as of the time of this analysis." **[Several experts on non-ionizing radiation disagree such as Steneck, who cited a variety of studies that have been done over the past few years .finding significant effects at very low radiation power levels."**

My hope is that victims will learn from this reprehensible behavior by U.S. government, as seen in the Agent Orange, Vietnam vet case, radiation experimentation and the Moscow Embassy employees and the microwave bombardment. The U.S. government has a policy of unaccountability to others and a disregard for the future except to exploit the rest of the world for their gain. As history of experimentation has shown, the underdog may win small battles but not the war. Learning from history is better than to deny this cold reality. Victims should fight with every tool they can and use this knowledge to plan a winning strategy.

National security law: numerous professionals say it is used to hide crime, corruption and horrific human rights abuse

U.S. Representative Patricia Schroeder, Federation of Atomic Scientist Steven Aftergood, University of Vermont law professor Stephen Dycus and more criticize the antiquated and unconstitutional (according to legal scholars) national security law. Citizen's rights are abused and crimes are covered up by national security law. After fifty years, this 1947 law is a cold war relic that is in need of revision.

Victims cannot get the facts out to the public. The internet has helped slightly, to overcome this major stumbling block. The 4-27, 5-3-92, p. 34 Washington Post article by George Lardner, reported on a 1992 CIA report on "Greater CIA Openness". Director Joseph DeTrani stated **"PAO [CIA's Public Affairs Office] now has relationships with reporters from every major wire service, newspaper, news weekly and television network in the nation," the report said. "This has helped us turn some 'intelligence failure' stories into 'intelligence success stories, and it has contributed to the accuracy of countless others. "In many instances," the report continued, "we have persuaded reporters to postpone, change, hold or even scrap stories that could have adversely affected national security interests or jeopardized sources and methods,"**

This is one of the best articles for proving the existence of a highly classified electromagnetic weapons program. A 7-7-97 US News and World Report article on 'Wonder Weapons', stated: **"And for a good 40 years the U.S. military has quietly been pursuing [nonlethal electromagnetic] weapons of this sort."**

Much of this work is still secret," Louis Slesin, a trade publisher for the electromagnetic industry further stated, "People [in the military] go silent on this issue more than any other issue. People just do not want to talk about this."

For fifty years, electromagnetic military research has been tightly controlled via the media, top scientists and government officials. Those who talk too much lose government funding and there are incidents and rumors of worse fates. For example, the unexplained deaths of 25 defense workers in England in the 1980s was described in the Tony Collins book, "Open Verdict". He wrote, "This wave of suspicious fatalities in the ultrasecret world of sophisticated weaponry has not gone unnoticed by the US government. Late last fall, the American embassy in London publicly requested a full investigation by the British Ministry of Defense. (MoD). The Pentagon refuses comment on the deaths. But according to Reagan administration sources, "We cannot ignore it anymore."

[Contents](#) | [Top](#)

U.S. government motive: a bloodless weapon better than the atomic bomb, experts warn

The connection between victims of nonconsensual experimentation and the US military philosophy is clear. **The goal of avoiding politically unpopular deaths in future wars and confrontations is met by electromagnetic and neurological weapons which can psychologically control and break down the enemy without leaving a trace.** U.S. military objectives for psychological warfare and weapons development match victim's allegations of experimentation and domestic counterintelligence programs. There are undoubtedly programs to develop electromagnetic and neurological technology to control brain function for counterintelligence purposes, in outer space conditions and on the battlefield.

This describes military goals in psychological warfare and matches the total devastation of victims lives by this technology. Defense News 9-14-20-98 p1, the subtitle is "Mobile Bedlam Brigades would sow broad chaos, confusion". It stated **"Essentially, the concept's aim 'is to control the will and perception of adversaries, from privates to princelings, by applying a regime of shock and awe,' group member Harlan Ullman, said Sept 9. "It is about effecting behavior."**

[Contents](#) | [Top](#)

A story of oppression: exploiting victims and billions of dollars in profits

Experimentation on radiation victims was condoned at the highest levels of government and the same cold war mentality has condoned electromagnetic and mind control experimentation. **There are billions of dollars and thousands of professionals working on this technology under the national security act. The bureaucracy that supports this technology is entrenched because of the long-term, classified cold war development of this weapons program. Further, because of the alleged abuses of the technology, the increasing arrogance of the military and a US foreign policy without arms control, an escalating hegemony is probable.**

The top officials of many countries undoubtedly know about electromagnetic and mind control technology, it is only the public that is in the dark. **Russia warned the world officially in 1979 UN disarmament documents. There was no major protest against weapons of mass destruction using electromagnetic radiation.** Top officials of many countries would have to know about or develop electromagnetic and mind control technology.

[Contents](#) | [Top](#)

Decoding the Brain: Top scientists tied to government and intelligence agencies worked on classified science

The evidence for the scientific basis of mind control technology, for the 'code of the brain' is supported by more examples such as described in the book, "Computational Bioelectromagnetics" by David Copson, 1982. I.I. Rabi Nobel prize winner, in **New York Post, Dec 29th 1939 and his article entitled "We are all Radio Receivers."** is similar to the discovery of the secrets of the atom by Einstein. Scientists discovered

DNA, the code of life; the theory of matter and the atom. There are compelling reasons to believe that scientists have discovered the decoding of the brain and consciousness for military purposes.

An article by Allan A. Needell entitled "I.I. Rabi, Lloyd V. Berkner and the American Rehabilitation of European Science, 1945-1954" stated that **"Following the war, Rabi, with J. Robert Oppenheimer, was among the most influential participants in the debate over the control of postwar American atomic energy policy."** The article continues, "[Rabi was] chairman of the "Scientific Adviser to the Policy Council" of the Pentagon's Joint Research and Development Board (JRDB). **"Among its duties was to advise the service secretaries (after 1948 the secretary of defense) on issues of long-term planning as well as the implications of scientific and technological advances for military strategy." The advisers assisted the founders of the Central Intelligence Group (forerunner of the CIA) in staffing a scientific intelligence branch."**

The public can decide if the available evidence is proof of victims claims. Here is the 1988 AP wire story on the microwave bombardment of the U.S. Embassy from 1953 to the present time. "Richard S. Cesaro, deputy director for advanced sensors at the Pentagon's Advanced Research Projects Agency, in an interview prior to his death two years ago, contended that **"in our experiments we did some remarkable things. And there was no question in my mind that you can get into the brain with microwaves. If you really make the breakthrough, you've got something better than any bomb ever built, because when you finally come down the line you're talking about controlling people's minds,"**

[Contents](#) | [Top](#)

A 50 year clash: The self-serving U.S. position, no proven nonthermal electromagnetic health effects vs the Russian and East Block position, a scientifically accepted fact

The 'thermal effects' of electromagnetic radiation are known. Microwave ovens used to heat foods is an example. The 'non-thermal' effects of electromagnetic radiation are very small amount of radiation and its effect on the human body. Research on biological effects of electromagnetic radiation is not in agreement with the long-term US policy that there are no nonthermal electromagnetic radiation effects. There is a fifty year documentation of US government efforts to withhold funding of nonthermal EMR research and to discredit scientists working on this research. **The 1979 Russian UN document discussed nonthermal effects of electromagnetic radiation and its potential use as a weapon.** H.P. Schwan, A.S. Presman, Dr. Ross Adey, B. Blake Levitt, court cases and books on electromagnetic health effects; all discussed in detail the history of suppression of the nonthermal electromagnetic radiation effects.

Here are examples of how the U.S. government conducts controversial national security issues. **The U.S. government handled the case of the Agent Orange and Vietnam veteran controversy by suppressing scientific studies.** The irradiation of the Moscow Embassy and the resultant ill embassy employees were not compensated as a result of a tainted, government funded study. Radiation victims and Area 51 toxic court cases could not get the classified proof of their claim. The U.S. government is using similar, unjust and exploitative methods in the current case. **The U.S. government controls most of the funding of electromagnetic research and suppresses scientific evidence for national security purposes. This is a major reason for the controversy today over health effects of electromagnetic exposure from power lines, cellular towers and cellular phones.** The government has funded research in agreement with their military interests while the public is at risk.

[Contents](#) | [Top](#)

Unclassified electromagnetic technology

There are examples of the intelligence and medical community's use of nonthermal electromagnetic radiation effects. This adds to the support for nonthermal effects of electromagnetic radiation on human beings. There are CIA documents, a NextMed2 Conference, an ElectroMed99 conference and an NIMH Neuroscience Research Report.

In addition, there are numerous examples of neurological research and the interest of intelligence agencies.

Just one example given in this book is the National Institute of Health receives requests from intelligence

agencies for ways to incapacitate the central nervous system remotely, US News and World Report, 1997. **There are several world class scientists who have made predictions and warnings of mind control technology over the last fifty years.** One example of the interest in neuroscience; 25,000 brain scientists attend Los Angeles, California, 1998 conference on news ways to map the brain.

The next two articles are profound in their implications. **This is what scientists are reporting, not victims.** A second example, ABCNEWS.com World News Tonight with Peter Jennings March 19, 1998 A Closer Look, Magnetic Therapy for Depression. with Forrest Sawyer, John McKenzie An ABC News transcript described magnetic therapy for depression, **"technology that can be used to manipulate people's thought processes, their mood, their memories and possibly even their will, if it is developed sufficiently."**

As summarized in the NYTimes Magazine, Sept 29, 1996, on Magnetic therapy. "scientists realized the key was rapidly pulsing the current on and off. .Here's how it might work: A hand-held computer programs the pattern at which the fields will fluctuate. **The impulses move through the temporal lobe and penetrate deep into the brain, where they interfere and interact with the complex electrical patterns of the subject's neural fields.** .When Persinger focuses the solenoids on the right hemisphere. they sense a negative presence, an alien. If you interfere with the opiate pattern, people get very irritated,"

[Contents](#) | [Top](#)

Key to consciousness: a military weapon

There is documented evidence that the US government has kept this secret for over 50 years and the US public cannot wait for the US government to tell them; it may be too late by then. **The facts, the motive and the 50 years of technological development add up and it makes sense that the discovery of the secrets of matter by Albert Einstein and the DNA code by Dr. Francis Crick and others are public knowledge but the research on the secrets of the mind is a classified military secret.** "We're All Radio Stations, .All Atoms, in Humans or in Steel, Found to Emit and Receive Long Waves" the 1939 New York Post stated. The nobel prize winner, I.I. Rabi proclaimed that "Every living thing on earth is a radio broadcasting and receiving set unconsciously sending out and receiving long-wave wireless messages." Rabi, along with Einstein was voted as one of the 'immortal' scientists of our time by a Fortune magazine poll of seventeen nobel laureates. He has been a top presidential and government advisor up to the 1970s. Like the discovery of the atomic bomb, scientists around the world made the same discovery around the same time, in this case, 1939. In Russia, Vernadsky and others were stating ideas similar to Rabi's fundamental discovery.

The evidence is growing. There are numerous allegations that electromagnetic and neurological technology is currently being used in programs of nonconsensual human experimentation, in domestic and foreign intelligence projects and for military action. The facts given in this book, such as 1979 UN Russian documentation of nonthermal effects of electromagnetic radiation for weapons use and the US 'nonthermal effects have not been proven' policy coupled with suppression of government funds for nonthermal effects research, are powerful evidence of a 50 year U.S. cold war cover story.

Here is an intriguing quote which a reporter could investigate. Steven Heims wrote "Cybernetics Group" book, Pg. 256, about Gregory Bateson, a famous anthropologist once married to Margaret Mead, (Mead also attended the CIA sponsored, 1950s Josiah Macy consciousness conferences described above). "I looked up Bateson in Sea Life Park in 1968. I had written to him in connection with my interest in the history of the Macy cybernetics meetings. His response was, **"There is certainly a piece of scientific history to be dug out of these meetings-I believe more profound and dramatic than The Double Helix."** [The Double Helix refers to DNA]

[Contents](#) | [Top](#)

A global viewpoint

The whole picture of a classified new weapon more powerful than the bomb has never been presented to the public in U.S. mainstream press. The microwave bombardment of the Moscow Embassy began in 1953 and it would seem likely that this was the beginning of the electromagnetic arms race between Russia and the U.S. The fears about development of new weapons of mass destruction has already been reported by all

of the recent Soviet leaders in foreign publications and this has been lost in the other major problems of the world. In addition, international diplomatic overtures involving electromagnetic weapons include the 1977-1996 proposals to ban "new weapons of mass destruction using new technologies by the Russians. The public protests via the Moscow Embassy microwave bombardment from 1953 to at least 1988 and the public display of the Russian woodpecker signal which the Russians broadcast in the 1970s, (see previous Cahra website articles) were diplomatic war games. From the 1950s to the 1990s, Russians protested U.S. mind control weapons, to no avail.

President Clinton or any president would arguably not have the clout to face the intelligence agencies or the Pentagon over such a deeply entrenched program involving careers and billions of dollars. After fifty years, mind control technology is in the hands of many, mainly the intelligence agencies, the pentagon, defense corporations and scientific research centers. The Jan.11-17, 1993 Defense News article by Barbara Opall stated,

"Known as acoustic psycho-correction, the capability to control minds and alter behavior of civilians and soldiers may soon be shared with U.S. military, medical and political officials, according to U.S. and Russian sources. .Therefore, the Russian authors have proposed a bilateral Center for Psycho-technologies where U.S. and Russian authorities could monitor and restrict the emerging capabilities."

Mind control is here to stay. It is only a matter of when it will be declassified and how? As Dr. Robert Becker, the two time Nobel prize nominee said, it may be too late to stop it.

The classified electromagnetic arms race is over, the U.S. won There are no major enemies of the United States. It is doubtful that the many countries of the world could agree and coordinate efforts against the United States. It would seem that the United States does and will have world control. This weapon would make it possible.

It is safe to predict that the next world war will be bloodless and silent. Nobody will talk about the electromagnetic weapons or how powerful they are because everyone has something to lose. Any victim will tell you, that they would not wish this weapon upon their worst enemy, (except the perpetrators). So everyone keeps silent. **Only the USSR publicly protested with electromagnetic weapons against the United States, since the 1950s up to the 1990s.**

Incidents, like the break up of the Soviet Union, even that, did not affect mind control international policy. **It is unlikely that a future incident will reveal electromagnetic mind control weapons, based on the Russian diplomatic protests via the Moscow signal and the Russian woodpecker signal etc.** In addition, the U.S. would not publicly reveal the purpose of the Moscow signal. In 1970 -90s UN disarmament documents, the Russians asked for the control of the development of weapons using nonthermal effects of electromagnetic radiation. They warned of powerful new electromagnetic weapons of mass destruction while the U.S. maintained an opposite policy from the 1940s to this day , nonthermal health effects have not been proven.

Unfortunately, electromagnetic weapons are not a political hot potato because world opinion does not significantly influence the U.S. The U.S. is in an ideal position for expanding its power. The public does not know about the weapon. If it is used there is no proof tying it to the U.S. and everyone knows not to talk about it or they may be the next victim. One of the many rumors is that Naval Admiral Boorda, who committed suicide, tried to reveal this technology and became a victim of it. (see strategy section above). The U.S. has nothing to lose, nothing to fear. There is everything to gain in keeping this technology classified. There are crimes to cover up. The weapons are powerful intelligence tools which maintain U.S. superiority. Victims can count on the expansion of national security law.

[Contents](#) | [Top](#)

Progress: victim's plans for the future

There are realistic strategies and solutions for dealing with the problem of nonconsensual experimentation using electromagnetic and neurological technologies. Victims must organize: a fundamental step in the process. Victims can work on projects such as codifying, (i.e. making) the Nuremberg Code into U.S. law with punishment for illegal experimentation. National and international laws on new technologies such as electromagnetic weapons need to be passed.

The legal, congressional, executive, human rights groups and media; all are more influenced by money and power than the relatively powerless victims. None of the above listed will take on a losing battle with the U.S. government over a current national security issue. But, victims can work on a grassroots solution. Victims can learn from the government's treatment of Moscow Embassy employees who were bombarded with microwaves, Agent Orange veterans and radiation experimentation victims. The U.S. government has a history of suppressing scientific research that is damaging and abusing the national security act to cover up crime. There has been progress made with newly declassified information and a steady increase in victim's allegations.

There is a high value placed on money and the low comparative value placed on human lives, especially during the cold war and continuing today in the United States, therefore victim's allegations have been ignored. When there is a critical mass of victims, then something will finally officially be done about the 'problem'. But victims should learn from the past and plan a strategy for change. Unfortunately it is a slow process and can hardly be called justice. Of course it is still worth the effort.

[Contents](#) | [Top](#)

International justice: with hard work and strategic planning

It seems clear that an international solution is worth pursuing. It is an avenue around the unethical US national security act. The United States has a poor human rights record and is considered to have a double standard and is losing credibility. But there is no challenge to the US and it's top position in the world. International human rights codes such as the Universal Declaration of Human Rights have influenced public opinion. Under a UN world court decision, the atomic bomb was ruled to be an illegal weapon. Even though governments continue to develop it, the UN world court decision is progress towards the goal of global peace.

The United States has opposed efforts to establish an international criminal court. The United States is the superpower and has a major effect on the world. The United States will probably continue with its current, short sighted hegemonic behavior. Criminal charges for war crimes in Rhwanda and Bosnia and against Pinochet under international law is encouraging. Accountability for human rights abuses will diminish future abuses.

[Contents](#) | [Top](#)

A final editorial opinion

The political will during the cold war condoned nonconsensual experimentation as the only feasible means to ensure the national security of the U.S. The rationale was to sacrifice a few victims to save the country from Russian dominance in the race to develop mind control weapons. The political will today has shifted to an economic dominance whereby victims are still sacrificed for progress in space exploration and better technology to ensure a military edge. There is no end in sight for the victims of this Holocaust.

When nonconsensual experimentation first happened to me, I was sure that I had a big court case because it violated the U.S. constitution and every fundamental right I was entitled to as a U.S. citizen. I felt that the democratic system worked and that in time, I would stop the nonconsensual experimentation. But it was not that simple and I was naive. Democracy is a system with flaws and problems. In my opinion, national security law is a cold war legal relic that has seriously harmed the system of democracy. It is up to the public and victims to change their government-imposed fate. The top leaders of this era knowingly condoned, planned and used science and technology for unimaginable evil, after the lesson of Nazi experiments and the Holocaust. The legacy of the development of mind control will be another dark spot in human history.

The weapon has not been used in a major war and the implications of its power has only affected the victims. But some day, the world will know the extent of this issue. World opinion will probably decide that war has been avoided with mind control weapons and therefore many lives were saved, These are some of the complicated issues and harsh realities worth exploring as victims continue to fight for their lives.

[Mind Justice Home Page](#)

Editor's Brief Summary

This article will list **two United Nations documents** which reflect the development of electromagnetic anti-personnel weapons. Then an article and book by **international human rights organizations** which are also working on this issue will be summarized. Finally, there is a **chronology of newspaper and journal articles from 1977 to 1998** documenting the international discussions on electromagnetic arms control and a short **conclusion**. Important points are **highlighted** so that the article can be skimmed.

There is overwhelming evidence of electromagnetic technology development for anti-personnel military purposes, as this article will demonstrate. Victims are coming forward in all major countries and are **claiming that their governments are experimenting on them with electromagnetic technology in a cruel, inhumane fashion**. The following factual documentation strengthens the claims of government nonconsensual experimentation, especially when this technology has its roots in cold war mentality and in light of the fact that **all major countries have a long history of electromagnetic weapons research and development**.

The main point of this article is that while people have good intentions, reality is very different. It is so critical to know this about people and to plan for this glaring problem. People do terrible things like radiation experiments. The nuclear arms race took on a life of its own and no one accepts the blame for spending billions of dollars on the arms race. Deception and rationalization and economic factors are a few of the main driving forces behind what is actually happening today. **This same pattern has and is occurring with electromagnetic weapons.**

Compelling and irrefutable evidence is presented in this article. In time, victims will break through the unfortunate patterns of human nature such as not wanting to believe that abuses are happening today. Victims are suffering horribly and that is why this is an urgent problem. Hopefully this article will speed up the process .

[Contents](#)

UN Committee on Disarmament Discussed Electromagnetic Weapons from 1979 to 1998

One excellent book is *The United Nations and Disarmament: 1945-1985* by the UN Department for Disarmament Affairs. (1985) New York, UN Publication Sales No. E.85.IX.6. It describes electromagnetic weapons issues from 1975 through 1985. This East West political disagreement, as described in this excerpt from pages 114-116, continues today.

New types of weapons of mass destruction and new systems of such weapons; radiological weapons

The question of new weapons of mass destruction has been under continuous consideration in the General Assembly and in the Conference on Disarmament for a number of years. The item "Prohibition of the development and manufacture of new types of weapons of mass destruction and new systems of such weapons" was first included in the agenda of the General Assembly in 1975 **at the initiative of the Soviet Union**, which submitted a draft international agreement. The topic is at present on the agenda of the Conference on Disarmament.

The Soviet Union and other socialist States in the Conference advocate a general prohibition of the development of new types and systems of weapons of mass destruction, on the ground that it is always more difficult to eliminate weapons after they are deployed than to ban their development and manufacture. With respect to the scope of the prohibition, those States have suggested that new types of weapons of mass destruction should include any type of weapon based on qualitatively new principles of action with regard to method of use, the target to be attacked or the nature of impact. **Most Western countries, while agreeing that the subject should be kept under review, have taken a different approach, namely, that new scientific developments should be dealt with individually as they arise and appear to have a weapons potential.** They have also held that the various developments pointed out by the Eastern European States as potential new weapons of mass destruction fall within categories that have already been identified and should be covered in that context, rather than as new weapons of mass destruction.

The Final Document of the 1978 special session of the General Assembly stated in paragraph 77 that in order to help prevent a qualitative arms race and so that scientific and technological achievements might ultimately be used solely for peaceful purposes, effective measures should be taken to avoid the danger and prevent the emergence of new types of weapons of mass destruction based on new scientific principles and achievements. The same year, the General Assembly, at its regular session, adopted two separate resolutions on the issue, one sponsored by the Western States and the other by the Eastern European States, reflecting the respective approaches.

Subsequently, **the Soviet Union clarified its position** by calling for a comprehensive agreement on the prohibition of new weapons of mass destruction that would be accompanied by a list of specific types to be banned, with the possibility of adding to the list in the future and the possibility of concluding separate agreements on specific new types of weapons as they emerged. To that end, **in 1979, the Soviet Union submitted a document to the Committee on Disarmament in which it listed some types of potential weapons of mass destruction, such as:**

- a. Radiological weapons (using radioactive materials) which could produce harmful radiation effects similar to effect of a nuclear explosion;
- b. Particle-beam weapons based on the use of charged or neutral particles **to affect biological targets.** Sufficiently powerful bundles of particles could be produced in accelerators used for research; in some operating accelerators, the energy of accelerated particles attained hundreds of millions of electron volts. Reduction of the size and weight of accelerator systems and power sources could permit their use as weapons;

- c. **Infrasonic "acoustic radiation" weapons. they would utilize harmful effects of infrasonic oscillations on biocurrents of the brain and nervous system;**
- d. **Electromagnetic weapons operating at certain radio-frequency radiations, which could have injurious effects on human organs. Within a few years, devices capable of directional transmission of electromagnetic radiation of enormous power over distances of several hundred kilometres might be developed, and radiation density in excess of safety standards could be produced over areas measuring dozens of square kilometres.**

In response, the United States and other Western countries, while expressing readiness to work out agreements on specific types of weapons which might be identified, took the position that a single treaty on the subject of all potential new weapons of mass destruction would have to be so general in its scope and so vague in its definitions that it would not be effective.

Every year since 1979, the General Assembly, on the initiative of Eastern European and non-aligned States, has adopted resolutions on the issue which, in the light of the different positions held, **have not received the support of Western States in the voting.** In its resolutions, the Assembly, among other things, has requested the negotiating body in Geneva to conduct negotiations, with the assistance of qualified government experts, **with a view to preparing a draft comprehensive agreement on the prohibition of the development and manufacture of new types of weapons of mass destruction and new systems of such weapons and,** where necessary, specific agreements on particular types of such weapons. **Since 1981, the General Assembly has further called upon the permanent members of the Security Council and other militarily important States to make declarations renouncing the creating of new types and systems of weapons of mass destruction, to be subsequently approved by the Security council.**

In the Committee on Disarmament, the issue was discussed mainly during plenary meetings. In 1981 and 1982, periodic informal meetings were held with the participation of experts in order to identify cases which might require particular consideration and which would justify the opening of specific negotiations.

At its 1983 and 1984 sessions, that negotiating body discussed the question at plenary meetings and intends to do so in 1985. The item under which the matter is considered is entitled: "New types of weapons of mass destruction and new systems of such weapons; radiological weapons". The Soviet Union and other socialist States have stressed the need for an *ad hoc* group of qualified governmental experts to elaborate both a general agreement and separate agreements on specific new weapons of mass destruction. **Western States, while restating their view on the matter have pointed out anew that no such weapon has been identified so far** and that the so-called nuclear neutron bomb, for example, about which concern has been expressed, could not be considered as a new weapon as is clearly a nuclear weapon and not based on new scientific principles. During the debate it has also been suggested that **the more powerfully armed states should adopt unilateral measures to prevent the use of scientific and technical discoveries for military purposes.** Because of these differences of approach, it has not been possible to establish an *ad hoc* group or other subsidiary body of governmental experts.

[Contents](#)

Prohibition Negotiations

This very important document, to follow in its entirety, described electromagnetic technology in detail. **This clearly and irrefutably establishes the fact that the superpowers were concerned and undoubtedly were developing electromagnetic anti-personnel weapons in 1979. This is worth reading. Mr. Harlan Girard of the International Committee on Offensive Microwave Weapons found this document at the UN library in New York.**

The title is: "Negotiations on the question of the prohibition of new types of weapons of mass destruction and new systems of such weapons".

U.N Committee on Disarmament document CD/35 10 July 1979 by V.L. Issraelyan, Representative of the USSR to the Committee on Disarmament.

Union of Soviet socialist Republics

Negotiations on the question of the prohibition of new types of weapons of mass destruction and new systems of such weapons

In the context of the current scientific and technological revolution and the unprecedented increase in the role of science in accelerating the general progress of mankind, there is, quite objectively, a growing danger of scientific and technological achievements being used to develop new weapons and, what is particularly dangerous, to develop new types and systems of weapons of mass destruction. As everyone knows, the process by which new weapons are developed -- once started -- is extremely difficult to stop. It is therefore vitally important, without waiting for any such irreversible turn of events, to obviate the very possibility of new types of weapons of mass destruction being developed.

To this end, the Soviet Union submitted a draft "agreement-on the prohibition of the development and manufacture of new types of weapons of mass destruction and new systems of such weapons" to the General Assembly of the United Nations in 1975. The General Assembly requested the Committee on Disarmament to work out the text of a draft international agreement on this question.

[Contents](#)

Subject of negotiations

Taking account of the progress made in the discussion of this draft agreement, the Soviet Union submitted an expanded draft agreement on the prohibition of the development and manufacture of new types of weapons of mass destruction and new systems of such weapons to the Committee on Disarmament in August 1977 (CCD/511/Rev.1). In this document, the Soviets Union drew attention to the question that must be resolved before all others, namely, that of the subject and scope of the prohibition of systems of weapons of mass destruction that is as close as possible to the 1948 forum on which there is already broad agreement among many States.

In order to make it easier to arrive at a generally-acceptable solution to the question of the scope of the prohibition, the Soviet Union considered that it would be useful for the agreement to contain both a general definition of the new types of weapons of mass destruction to be prohibited and a list of the specific type and systems of such weapons. This approach is reflected in the expanded draft agreement, the annex to which contains an approximate list of types and systems of weapons of mass destruction, including:

1. Radiological means acting with the aid of radioactive materials;
2. Technical means of inflicting radiation injury based on the use of charged or neutral particles to affect biological targets;
3. **Infrasonic means using acoustic radiation to affect biological targets;**
4. **Means using electromagnetic radiation to affect biological target.**

In order to accommodate the views of members of the Committee on Disarmament, the Soviet side had the expanded draft agreement provide for the possibility, should the need arise, of prohibiting specific new types and systems of weapons of mass destruction on the basis of separate agreements.

Thus, the proposals of the USSR on the scope and subject of the prohibition provide for:

- a. The conclusion of a comprehensive agreement on the prohibition of the development and manufacture of new types and systems of weapons of mass destruction, with a list of specific types of weapons to be prohibited;
- b. The possibility of supplementing the list of prohibited new types of weapons of mass destruction in the future; and

- c. the possibility of concluding separate agreements on specific new types of weapons of mass destruction.

Scientific and technical basis for the possible development of certain new types of weapons of mass destruction

The approximate list of possible new types and systems of weapons of mass destruction covers physical effects, the harmful or fatal consequences of which for the human organism have already been thoroughly investigated; the general level and orientations of the corresponding fields of science and technology are such that these physical effects might find a practical application in real weapons in the foreseeable future.

[Contents](#)

Radiological weapons

The danger of radiological weapons being developed is based on the existence in principle of the possibility of using radioactive materials in order to injure, damage or cause harm by means of the radioactive radiation produced when such materials decay.

The way in which radioactive materials affect human beings has been adequately studied and consists in the destruction of biological structures under the influence of the ionizing radiation resulting from the radioactive decay of such materials. There is every reason to believe that the effects of radiological weapons, should they be developed, would be similar to the effects of the radioactive materials which are formed in nuclear explosions and which cause the radioactive contamination of the area. The danger of radiological weapons appearing is increased by the rapid development of nuclear industry and technology in many countries of the world; this creates the objective conditions necessary for the widespread dissemination of radioactive materials and increases the potential danger of such materials being used to develop radiological weapons.

There is broad international agreement on the question of the need to prevent the possible emergence of radiological weapons. The joint USSR-United States negotiations on major elements of a treaty prohibiting the development, production, stockpiling and use of radiological weapons have now been successfully completed and the agreed proposals on this question have been submitted to the Committee on Disarmament for consideration.

[Contents](#)

2. Technical means of inflicting radiation injury based on the use of charged or neutral particles to affect biological targets

The danger with regard to the development of technical means of inflicting radiation injury based on the use of charged or neutral particles lies in the existence of the possibility of in principle using bundles of charged or neutral particles (electrons, protons, neutral atoms, etc.) to cause injury to biological target, and in the existence -- even now-- of the scientific and technological basis for the possible future development of sources of such particles that could be used for these purposes. It has been established with a considerable degree of certainty that the way in which the particles that can be used for such purposes cause injury is in many respects similar to the way in which the radiation from a nuclear explosion causes injury.

Sufficiently powerful bundles of charged or neutral particles can now be produced in, for example, the accelerators which are being widely used both for research on high-energy physics and the atomic nucleus and of work in other fields of science and technology, including agriculture and medicine. Several countries are already operating or installing proton accelerators in which the energy of the accelerated particles attains hundreds of millions of electron volts, high-current accelerators of the meson facility type and high -current continuous or pulsed electron accelerators. Several countries are carrying out intensive work on the development of fundamentally new methods of accelerating charged particles, and, taken together with the success achieved with regard to the development of superconducting materials, this opens up real possibilities of reducing the size and weight of accelerator systems and the sources of energy used to operate them and, in theory, paves the way in the foreseeable future for the development of powerful accelerator devices-- whose weight and dimensions could permit their use as weapons. Direct confirmation of the possibility of this happening is provided by the programme of work being carried out in the United

States with a view to developing weapons using bundles of accelerated charged or neutral particles, as may be seen from published accounts of hearings in the United States Congress and other material that has appeared in the United States press.

[Contents](#)

3. Infrasonic means using acoustic radiation to affect biological targets

Weapons based on the utilization of the radiation of acoustic generators in the infrasonic range may become one of the possible new types of weapons of mass destruction. Data to be found in scientific literature convincingly demonstrate the existence of a wide spectrum of damaging effects of infrasonic oscillations on the human organism and other biological targets. The mechanism of such effects can be of the most widely varying kind -- mechanical, biological or neurochemical. Evidence of the danger of the damaging effects of such oscillations on human beings is, in particular, offered by the fact that many countries have already introduced health regulations in respect of maximum admissible acoustic effects. Particular concern is caused by available data concerning the harmful effects of low-power infrasonic oscillations on biocurrents of the brain and the nervous system as a whole and, thereby, on the psychic condition and intellect of human beings. In assessing the potential danger of the utilization of infrasound as a weapon of mass destruction, great importance attaches to its basic physical property --that of practically unimpeded propagation over large distances without noticeable attenuation. The development of powerful engines in connexion with advances in rocket technology, supersonic aircraft and in other areas of technology offers a technical basis for creation of powerful long-range installations with characteristics which may make such installations suitable for use as infrasonic weapons. (Editor's note. This is a strikingly similar description of the Russian Woodpecker radio signal broadcast over the United States in 1976. (See CAHRA [now Mind Justice] website under Timeline 1976).

[Contents](#)

4. Means using electromagnetic radiation to affect biological targets

As a result of research into the effects of electromagnetic radiation on biological targets, the existence of harmful effects of radio-frequency radiations within a wide range of frequencies on such vitally important organs of the human as the heart, the brain and the central nervous system may now be regarded as a firmly established fact. Assessments quoted in international literature of the potential danger of the development of a new weapons of mass destruction are based on the results of research into the so-called "non-thermal" effects of electromagnetic radiation on biological targets. These effects may take the form of damage to or disruption of the functioning of the internal organs and systems of the human organism or of changes in its functioning.

As regards the possibility of devising technical means of generating electromagnetic radiation, many countries already have a highly developed technical base in the field of radio engineering and radio electronics. Powerful high-frequency generators, radar devices and other radio engineering installations serving various purposes have been developed and brought into use. The development of these means reflects a common trend in that efforts are being made to improve their characteristics, increase their efficiency and reduce their dimensions. Data available in the scientific literature show that the peak capacity of electromagnetic radiation generators has increased almost a hundredfold during the past four years alone. It is expected that, in the next five or six years, means capable of the directional transmission of electromagnetic radiation density in excess of known safety standards will be attainable in areas measuring dozens of square kilometres.

It is therefore to be expected that, taking into account further achievements in science and technology, it may be possible in time to devise means of generating powerful electromagnetic oscillations whose parameters could make those means suitable for use as a new type of weapon of mass destruction.

During the course of the discussion in the Committee on Disarmament of the question of the prohibition of new types and systems of weapons of mass destruction, Soviet experts as well as experts from a number of other countries adduced concrete scientific data and facts which convincingly demonstrate that, in view of the present level of science and technology in certain areas, it is scientifically justified to speak of the possibility of developing corresponding new types of weapons of mass destruction, and in particular those listed in the annex to the expanded draft agreement. It is practically no longer possible at the present time to

dispute the fact that the possibility of developing new types and systems of weapons of mass destruction -- the consequences of whose emergence are as yet difficult to foresee -- exists, and that the problem of the comprehensive prohibition of the development, manufacture and stockpiling of new types and systems of such weapons is therefore a pressing one.

[Contents](#)

Organizational measures

Taking into account the approach adopted by the Western countries to the solution of the problem of the prohibitions of new types and systems of weapons of mass destruction, the Soviet Union took yet another constructive step, and on 28 March 1978 proposed the establishment, under the auspices of the Committee on Disarmament, of an ad hoc group of qualified governmental experts to consider the question of possible areas of the development of new types and systems of weapons of mass destruction to be included in the initial list of the types of such weapons to be prohibited under a comprehensive agreement. This would ensure an even more comprehensive study and identification of potentially dangerous areas as regards the development of new types of weapons of mass destruction. A group of this kind could continuously observe developments in this field and, at the very earliest stage of the possible emergence of new types of weapons of mass destruction, make appropriate recommendations to the Committee on Disarmament.

[Contents](#)

Other negotiations

The conduct of negotiations on the prohibition of new types of weapons of mass destruction and new systems of such weapons will be without prejudice to bilateral and multilateral negotiations relating to various aspects of arms limitation and disarmament.

The world's concern at the danger of the development of weapons of mass destruction is reflected in paragraph 39 of the Final Document adopted by the specific session of the United Nations General Assembly in 1978, which emphasizes that:

"Qualitative and quantitative disarmament measures are both important for halting the arms race. Efforts to that end must include negotiations on the limitation and cessation of the qualitative improvement of armaments, especially weapons of mass destruction and the development of new means of warfare so that ultimately scientific and technological achievements may be used solely for peaceful purposes".

The decision proposed by the Soviet Union makes it possible to achieve the prohibition of the development and manufacture of new types and systems of weapons of mass destruction in potentially dangerous areas already detected and also, in principle, to erect a barrier against the possible emergence of such weapons as a result of progress in other spheres of science and technology.

Editor's note: This is the end of the article.

International Organizations' Involvement

The history of electromagnetic weapons can be also be found in international documents such as the International Committee of the Red Cross Report. Review Conference of the 1980 Convention page 158 entitled **Future Weapons**.

"The Conference of Government Experts that met in Lucerne and Lugano in 1974 and 1976, and whose findings served as a basis for the United Nations conference that adopted the 1980 convention, discussed a number of **futuristic weapons. these included laser weapons, microwave, infrasound, and light-flash devices, environmental warfare and electronic warfare.** The experts recognized that at that time it was too early to consider specific restrictions on devices that were only at the research stage. However, the majority stress the

importance of keeping a close watch on developments in order to introduce specific prohibitions or limitations that might be necessary before the weapon in question became widely accepted. ...as regards the futuristic weapons discussed at the Lucerne/Lugano Conference, developments in laser technology have raised the possibility of one disturbing application, namely, the use of lasers as anti-personnel weapons to damage eyesight. This matter is referred to above under the heading "Blinding weapons". There has also been further research into other new technologies, in particular **directed energy weapons such as high-power microwave and infrasound devices.** ...In particular, it is important to ensure that new weapons do not have indiscriminate effects and that they do not contravene the rule prohibiting the use of weapons of a nature to cause **unnecessary suffering or superfluous injury** to combatants."

The Stockholm International Peace Research Institute was also actively reporting on electromagnetic weapons in the 1978 book **Anti-personnel Weapons** in the chapter entitled Electric, acoustic and electromagnetic-wave weapons. Here are some very important excerpts.

SIPRI, Stockholm International Peace Research Institute. (1978). *Anti-personnel Weapons*. Crane, Russak & Company, New York.

Chapter 8. **Electric, acoustic and electromagnetic-wave weapons**

p.203. "It has also been suggested that at **very low frequencies, resonances may be set up at other sites in the body, such as the heart, with various physiological effects, including possibly death, as a result. It appears that these phenomena have been investigated with a view to possible military applications.**"

p. 205 " **It has been known for many years that the human brain is dependent for its normal functioning on a regular input of sensory stimuli. Sensory deprivation leads to hallucinations and finally to mental breakdown.** ...the technique 'clearly amounted to brutality' and was 'dangerous both to the immediate mental health of the individual subjected to this treatment and to the long-term health of some subjects' (Amnesty International 1971).

p. 206 " **Stroboscopic flashing has also been considered for use against demonstrators in civil disturbances.** At 5-15 Hz, it can cause various physical symptoms and it is believed that it may **initiate epileptic seizures in a small proportion of people. The fact that flashing lights can precipitate epileptic fits has been known for many years,...** ...Possible military potential was investigated in the **1960s** and a device known as the Photic Driver was developed by a British company, Allen International (New Scientist, 29 March 1973). The use of a Photic Driver by South African police during interrogation of prisoners has been reported."

p. 208 "There has been speculation on **the use of lasers as weapons** for some time (e.g., Meyer-Arendt, 1968; Foley, 1972; Born, 1976). ...It can be calculated that a 1kW CO2 laser beam will cause a localized soft tissue burn 1 cm deep over an area of 1 cm2 within one second. ...Firstly, it means that the human eye is particularly sensitive to laser beams.

p. 208 The proliferation of high-power radio transmitters and powerful radars employing **microwaves has stimulated some research into the biological effects of such waves (Harrison, 1973; Lebowitz, 1972).** Microwaves are already widely used for the rapid heating of foods, and the possibility of using them as weapons provoked some discussion at the Lucerne Conference of Government Experts (ICRC, 1974). Military research into the effects of microwaves on animals and materials is continuing (U.S. Army Research and Development News Magazine, March-April 1977).

A Chronology of Newspaper and Periodical Articles on the International Electromagnetic Weapons Arms Control Debate From 1977 to 1998

1977, August 22,. Soviet Propose Ban on 'Exotic' Weapons . Aviation Week and Space Technology. pg. 21.

"Soviet Union last week proposed to the Trilateral Nuclear Arms Limitation Conference in Geneva a comprehensive agreement on development of so-called exotic weapons, including those involving charged

or neutral particles. ...The Soviet proposed that development and manufacture of four general classes of weapons be prohibited. These included : ...**Infrasonic means of using acoustic radiation to affect biological targets. Means of using electromagnetic radiation to affect biological targets.**

The U.S. later told the Soviets that while it viewed the Soviet proposal "with interest" it felt that **the best way to prevent development and manufacture of exotic new weapons is to keep the entire field of weapons development under review, identify new weapons or weapons concepts and then specifically tailor methods of control for each new type of weapon "to assure compliance."** The U.S. said it did not believe that nations needed to wait until a new weapon was developed to seek ways of controlling it, but that it did not believe a single treaty could cover all possible developments.

1979, June 27. Gromyko's Press Conference. BBC Summary of World Broadcasts. Part 1 the USSR;C. the aftermath of Salt-2;Su/6152/C/7; Lexis-Nexis.

Gromyko discussed new types and new systems of weapons of mass destruction and other arms negotiations.

1979, July 25. Soviet-US Initiative to Ban Radiological Weapons. Commentary by Antonin Kostka. BBC Summary of World Broadcasts. Part 2 Eastern Europe: A. International Affairs:1. General and Western Affairs;EE/6176/AI/2 Lexis-Nexis.

"...concerning a ban on the development and manufacture of **new types of mass annihilation weapons and new systems of such weapons** ...Practice has shown on more than one occasion that it is much easier and simpler to ban weapons which exist only on the drawing board than those which have been prepared for use in military arsenals. **The convention on banning devices which enable the environment to be modified for military or other hostile purposes is a very eloquent example of this.** ...The hardware of destruction advances and improves so fast that the progress of disarmament negotiations is constantly behind the development of weaponry."

1980, July 22. Chemical and Radiological Weapons. BBC Summary of World Broadcasts. Part 1 The USSR; A. International Affairs;1. General and Western Affairs; SU/6477/A1/3; Lexis-Nexis.

"The Soviet Union views the banning of radiological weapons as part of the solution of the problem of **an all-embracing ban on new types and systems of weapons of mass destruction.** ...The forthcoming ban on radiological weapons is an important confirmation of the timeliness of the Soviet initiative on the banning of the creation of new types and systems of weapons of mass destruction."

1982, May 26.Buckman, John. The U.N. and Disarmament: The Second Special Session. Heritage Foundation Reports. A UN Assessment Project Study; No 186.

This article **discussed new types of weapons of mass destruction and new systems of such weapons and the political currents** surrounding the Second Special Session on Disarmament(SSOD-II) in New York June, 1982 by the UN General Assembly. "...SSOD-II also will provide another chance for Third World countries to 'internationalize' nuclear reduction efforts and for some Soviet-inspired "peace groups" to further their attempts at harassing and discrediting the U.S. and the West. ...Massive demonstrations are being planned with the Session with the predictable veteran radical groups churning out their usual anti-military diatribes. ... **Various "non-governmental organizations" (NGOs) are officially recognized by the U.N. as spokesmen for citizens on a host of issues**, and are accorded accreditation to take part in sessions and meetings. ...While most of the groups are legitimate associations representing the full spectrum of political ideology, no fewer than eleven of them have been identified by the State Department as "fronts" for the Soviet Union."

1983, January 27. Soviet Delegation to UN Disarmament Committee Session in Geneva. BBC Summary of World Broadcasts. Part 1 The USSR; A. International Affairs:1. General and Western Affairs;Su/7242/A1/4. Lexis-Nexis.

Editor's note: Israelyan is author of 1979 important UN document cited above. "Text of report of statement by **Viktor Israelyan**, head of Soviet delegation. ...However the work of the Committee has recently been

marking time **principally because of the obstruction position of the USA and several of its NATO allies**. The USA justifies the concept that nuclear wars, whether limited protracted or otherwise, are possible. **New types of weapons, including weapons of mass destruction**, are being designed and produced. The danger of war, above all nuclear war, is increasing."

1986, January 21. Press Conference on Gorbachev's Nuclear Arms Elimination Proposals. BBC Summary of World Broadcasts. Tass for abroad. Part1 The USSR; A. International Affairs; 1.General and Western Affairs;SU/8162/A1/1. Lexis-Nexis.

Editor's comment. The speaker who is answering is not identified in this article. "[Answer] **Weapons based on new physical principles would include, amongst others, means in which physical principles which have not been used hitherto are used to strike at personnel, military equipment and objectives. Amongst weapons of this kind one might include beam, radio-wave, infrasonic geophysical and genetic weapons. In their strike characteristics these types of weapons might be no less dangerous than mass strike weapons. The Soviet Union considers it necessary to establish a ban on the development of arms of this kind. The Soviet union has not carried out, nor does it intend to carry out either tests of such arms, or -even less so - the deployment of them. It will seek to ensure that all other countries do not do so either.**"

1986, Jan.27. Pravda Editorial on Gorbachev's Programme of Nuclear Disarmament. BBC Summary of World Broadcasts. Part 1 The USSR; A. International Affairs;1. general and Western Affairs; SU/8167/A1/1. **Pravda 25 Jan 86**. Lexis-Nexis.

"...At this point it is appropriate to draw attention to the fact that the Soviet programme has been drawn up with due consideration for the fact that the currently prevailing balance of forces in the world is to be maintained at all states of its implementation, but at an ever lower level. No threat to anyone's security will be created at any moment of its implementation." ...They include in particular **beam, radio wave, and infrasonic and genetic weapons which, in terms of their destructive potential, could be no less dangerous than already existing weapons of mass destruction**. ...As for the USA, which is the primary addressee of the Soviet proposals, a statement by President R. Reagan described by the Western press as 'cautious and carefully considered' has been disseminated there. Unfortunately, there has been nothing more than that so far."

1986, November 11.United Nations. U.N. Committee Urges Ban On New Weapons of Mass Destruction. Reuters North European Service. Tuesday, PM Cycle. Lexis-Nexis.

" **The United States cast the only negative vote** when a United Nations Committee reaffirmed the need to **ban the development and manufacture of new weapons of mass destruction.....**The draft, sponsored by the Soviet Union and 18 of its allies, also called on all states, **immediately following identification of any new weapon of mass destruction, to begin negotiations on its prohibition with the simultaneous introduction of a moratorium on its practical development.**"

1988, June 21. Wenrong, Quian. Roundup: A New Trend of Arms Race Between Two Superpowers. Xinhua General Overseas News Service.

"While welcoming the initial progress in the American-Soviet nuclear disarmament, delegates to the U.N. special session on disarmament has advised the world community to pay more attention to the dangerous new trend in the arms race between the two superpowers. Delegates pointed out that the new trend is characterized by an extension into outer space and a shift to improving the quality of weapons. The Indian delegation said that " **the prospects for real disarmament will remain bleak so long as this technological arms race is allowed to continue unabated.**" In the field of nuclear weapons, American and Soviet researchers have increased the emphasis on development of so-called "third generation" nuclear weapons such as the neutron bomb, x-ray laser, gamma ray laser and **microwave weapons**. ...It is worth noting that many new technologies, such as genetic engineering and biotechnology, have been used to produce chemical and biological weapons. ...If the new technologies are utilized for military purposes, **there could be a new race to develop ever more hideous weapons, U.N. delegates warned. Unfortunately the U.S. delegation has expressed its strong opposition to any restrictions on the use of new technologies in military research and development. As for the Soviet Union, there is no sign that it**

will give up the race to develop new arms systems programs in both nuclear and conventional weapons, ..."

1993, May 25. Hudson, Richard L. Russia Lifts Secrecy In an Attempt to Sell Military Equipment. Wall Street Journal. International Section.

"Though most state-of-the-art technology remains secret, this week's show reflects **Moscow's desire to sacrifice some secrecy for more sales**. ...Now with state scientific institutes starving for funding, scientists are embarking on commerce by themselves."

1993, July 9. Rubin, Elizabeth. Foreigners Seek Scientific Ties With Russia. Wall Street Journal. B7A.

Editor's comment. Surely history is repeating. America is undoubtedly exploiting the break up of the Soviet Union.

"...Another technology treasure trove believed to be hidden behind the iron curtain is **the potential commercial applications of technologies developed under secrecy for military use**. ... **A new Russian-U.S. joint venture** aims to identify and evaluate these technologies and others for licensing and marketing outside the former Soviet Union. The new Arlington, Va, company, East/West Technology Partners Ltd. brings together the U.S. company BDM International Inc. the International Technology Exchange Corp of Washington, D.C., and a new Russian company, Technology Exhibition and Investment Inc. of Moscow. The Russian partner is able to **open the door on defense research for the joint venture because it is essentially consortium of top Russian scientists, including Yevgeny Velikhov, vice president of the Russian Academy of Sciences and a leader in the Soviet physics establishment**."

1993, December 23. Press Conference by RF Foreign Ministry Spokesman Grigory Karasin. Official Kremlin Int'l News Broadcast. News/ Current Events. Lexis-Nexis.

"Q: ABC television. Recently, making a tour of Western Europe Mr. Zhirinovsky said **Russia has new weapons, having no analogues in the world, electronic weapons which can destroy any point of the world, and it has unique opportunities. What could you say about such weapons? Do they exist?** And what could you say about **Zhirinovsky's** statement? Karasin: I should tell you that I briefly heard about this statement from my colleagues. I have not read the materials. But as I have already told you, we stick to the rule to comment on addresses or official statements related to the official political course, to the official real policy. That is why I think that the Foreign Ministry's comments on this would be improper. Q: And what about these weapons named "**Electron**"? Karasin: **I don't know anything about it**. Any more questions?"

1994, July 15. Testimony July 15, 1994 William Grundmann Director For Combat Support Defense Intelligence Agency House Joint/Economic Conditions In Eastern and Central Europe. Federal Document Clearing House Congressional Testimony. Lexis-Nexis.

"...Russian military leaders have indicated that R&D should emphasize leading technologies such as stealth, precision weapons, command and control, and advanced electronics, and **weapons based on "new physical principles" such as lasers and radio frequency weapons**. **Russia will be hard pressed however, to find resources** for the investments needed to complete development of these technologies and bring them into production in the future. ...to help Russia emerge as a constructive player in European and Asian security systems."

1995, October 20. Press Review. Russian Information Agency ITAR_TASS. Lexis-Nexis.

"Rossiiskaya Gazeta on the development of a psychotronic generator. Specialists at the state-run Research and Production Enterprise Delta have designed a **psychotronic generator which is capable of bending the mind by means of acoustic waves**. The Newspaper's new analyst Albert Valentinov, in an article headlined "**A Secret Signal to Suicide**" sought to have a look behind the stages of research and find out the extent to which the psychotronic generator is hazardous to people."

1997, February 14. Li, Jingchen. Roundup: Disarmament Conference Adopts Vague Agenda. Xinhua News

Agency.

"The Conference on Disarmament(cd) today failed to adopt a specific agenda for 1997 but listed eight items in a vague agenda. According to a cd press release, the eight items listed for consideration by the cd are... **new types of weapons of mass destruction and new systems of such weapons,...**" Analysts say that the broad agenda adopted today is a compromise among negotiators just for the session to go on."

1997, September 29. Wilson-Smith, Anthony. Under friendly fire. Maclean's. p 24.

Editor's note: The political currents are complicated and a professional lobbyist would be best in order to figure out a plan of action for victims.

"...The other friction point, which caused Canadian officials to react with disappointment but little surprise, was the U.S. refusal to join close to 90 countries in backing an international treaty spearheaded by Canada that seeks to ban all use of antipersonnel landmines. ... **the most important consequence of the treaty, said lawyer Louise Doswald-Beck of the International Committee of the Red Cross, is that "this will be the first time ever that international humanitarian law has prohibited a weapon in widespread use."** In the wake of Washington's refusal to sign, the pressure on Clinton to reverse his stand appears likely to become even more intense. A group of Nobel Peace Prize laureates, including Desmond Tutu, Mikhail Gorbachev and Lech Walesa, wrote Clinton last week asking him to reconsider."

1998, January 22. Conference On Disarmament Begins First Part of 1998 Session. M2Presswire. Lexis Nexis.

"Opening the meeting , the President of the Conference, Lars Norberg(Sweden), recalled that in 1997 one of the most important events in the field of disarmament was the entry into force of the Chemical Weapons Convention. It was a source of great satisfaction and inspiration to further multilateral disarmament efforts. ...Also this morning, the Conference adopted its agenda, ... **new types of weapons of mass destruction and new systems of such weapons;**"

1998, February 11. Deen, Thalif. UN protocol brings laser blinding ban into force. Jane's Defense Weekly. Vol. 29;No.6:Pg.6. Lexis-Nexis.

Editor's note. This seems to be the likely method of banning electromagnetic weapons at an international level.

"According to the ICRC, this is the **second time in modern times that a lethal weapon has been prohibited before its use in war;** "...The protocol[ban blinding lasers] **highlights the role of international humanitarian law in preventing a horrific new form of suffering for soldiers and civilians alike,** Doswald-Beck[Louise, of the ICRC] said. The ICRC has urged all UN member states to adhere to the protocol as soon as possible and **to adopt national measures to prevent the production, transfer,use and proliferation of blinding laser weapons.** The convention, which was adopted in 1983, has three other protocols. they prohibit the use of booby traps, incendiary weapons and non-detectable fragments in weapons of war."

[Contents](#)

Some Conclusions

The few humanitarian international organizations working on arms control are possible avenues for victims of government experimentation to pursue. At least now the history of international electromagnetic weapons development is irrefutable and lessons can be learned from comparisons with the history of the atomic bomb.

Victims are no match for the resources of the government and the lack of political will. The public must educate and decide for themselves on this issue. Given the incredible odds against them, victims who allege electromagnetic human rights abuses deserve the benefit of the doubt. Because of the seriousness of the allegations and the amount of evidence, **an investigation should be called for.** This is a reasonable request.

It is appallingly evident that **there has been no public protest about the highly classified electromagnetic weapons**, unlike the history of the nuclear arms race. This is a serious problem, the spending of billions of dollars and developing the weapons without public input, not to mention allegations of human rights abuse. Another major point can be drawn from this depressing account of the electromagnetic arms race- **a few people in the international community have made a difference**. The power to make a difference is the hope that victims can count on.

The future of electromagnetic technology is undoubtedly in the hands of the United States and it is interesting to speculate on how the technology will be distributed and controlled globally. There are published accounts of microwave hearing to create the phenomena of hearing voices and other electromagnetic military and intelligence uses (See CAHRA [now Mind Justice] website). But the remote reading of the victim's thoughts and direct communication with the brain, this sophisticated technology may not be declassified for years. And undoubtedly, the covert use will grow, as published articles have revealed. The effect of multinational corporations, military-industrial connections and economic concerns on the distribution of this technology is difficult to predict. **It goes without saying that it is a loss that this technology is not being used in peaceful and health-enhancing ways.**

Armed with the facts, victims can plan more effectively. For example, there could be a project, as a group rather than individually; and working with the international human rights community on passing international law against "microwave hearing" abuses or working on new protocols banning electromagnetic weapons. Further research is needed. These are a few goals to work towards.

CAHRA [now Mind Justice] is a nonprofit 501(c)3 and cannot act in any political way. This paper is not an attempt to aid or hinder any political act. The views expressed are the opinion of Cheryl Welsh only. Please share your thoughts and ideas with CAHRA [now Mind Justice].

A rebuttal to Dr. Farah's comment that mind reading is "a million light years away," and reading a person's thoughts through subvocalization is "cheating"

**by Cheryl Welsh
April 18, 2011**

[Mind Justice Home Page](#)

Several U.S. citizens provided comments at a recent Presidential Bioethics Commission meeting, and alleged that the U.S. government was conducting illegal secret mind control experiments and deploying secret neurotechnologies as weapons, including mind reading and remote targeting to cause physical and psychological pain and injury. See [this page](#).

A question from the audience referred to the History Channel program, The History Channel, That's Impossible series, episode 6, titled *Mind Control*, August 11, 2009. The questioner described a section of the program that "showed a mute paraplegic where they had implanted a chip in his throat. His thoughts were going onto a computer screen." When a person thinks, the thoughts are reflected in the electrical/mechanical activity of the vocal apparatus, which can be detected and translated into words. This technology was demonstrated on the History Channel Program.

Dr. Farah replied to the questioner and stated that advanced precise, real time mind reading was "a million light years away." Even mind control victims agree that by today's unclassified neuroscience literature, mind reading is not possible. Dr. Farah further stated: "One does sense microscopic movements in the vocal apparatus and basically looks at subvocalization. It's basically a way of just using speech that you can't hear. I think it would be a cheat to call that mind reading." But in fact, human experiments have demonstrated that microscopic movements in the vocal apparatus occur for mental activities including imagination, recollection and abstract thinking See Jacobson, E., *Physiological Laboratory of the University of Chicago* (1931). Electrical measurements of neuromuscular states during mental activities: VII. Imagination, recollection and abstract thinking involving the speech musculature. *American Journal of Physiology*, 97, 200-209.

This 1931 scientific article is available in any medical library. (Referenced in the 1997 book *Mind and Brain Sciences in the 21st Century* edited by Robert Solso, Chapter 3 Will the Mind Become the Brain in the 21st Century? by Richard F. Thompson, p. 40) Jacobson recorded electromyography activity from the tongue and was able to determine from this measure whether the subject was thinking of the word "one" or "two" or "three." (Jacobson, p.207). The experiment conclusion stated: "During imagination, recollection and concrete or abstract thinking involving words or numbers, muscular contractions characteristically appear as specific components of the physiologic process of mental activity. These contractions generally are minute but sometimes are grossly visible." (Jacobson, p.209).

The History Channel program made clear that subvocalization is not about reading thoughts; see the [transcript](#). The experimenter stated:

Callahan:

We often get asked if the audio picks up thinking or my thoughts. And the answer is no, definitely not. You may be thinking right now about things like that you have to go to the bank later today or you're hungry. But unless you have an actual desire to communicate those things, then there's no activity for us to pick up.

But the 1931 experiment stated otherwise, as did Solso's book which unequivocally stated:

It is indeed the case that thinking in normal adult humans is accompanied by movement of the vocal apparatus: subvocal speech. Jacobson recorded electromyography activity from the

tongue and was able to determine from this measure whether the subject was thinking of the word "one" or "two" or "three." (Jacobson, 1931). (Solso, p. 40).

As this academic psychology book by Solso explained below, this technology was successfully proven to work in 1931. The lesson to learn from this is not that a highly esteemed expert and the History Channel can be wrong but rather, the possibility of secret illegal mind control experiments using such a technology is scientifically possible and should be thoroughly and impartially investigated.

MIT Press published the 1997 book *Mind and Brain Sciences in the 21st Century* edited by Robert Solso, a collection of chapters on 20th century psychology and predictions about the future of psychology. One chapter by Richard F. Thompson is titled *Will the Mind Become the Brain in the 21st Century?* Thompson described the same thought reading technology that the questioner and Dr. Farah described above. But first, Solso described Thompson and his work. Solso also provides a glimpse of the controversy among scientists over whether the mystery of consciousness will ever be solved. Dr. Farah also alluded to this scientific uncertainty when she made her "million light years away" comment. Solso wrote:

Thompson, one of the world's leading neuroscientists, was hard iron forged in the crucible of the "dustbowl of empiricism" at the University of Wisconsin by the hands of Harry Harlow, Wulf Brogden, and David Grant, who were shaped in turn by the hand of Watson. So it is consistent with his background that Thompson would introduce behaviorism, the yoke cognitive psychologists though they had successfully disposed of several decades ago, by quoting Watson's surprisingly reasonable, albeit entirely internally consistent notion that phenomena like "consciousness" and "mind" might be measurable even though, presently, they can only be observed indirectly by (you guess it) measuring *behavior*.

How might the "secret thoughts" of consciousness--such thoughts as a young man or woman might have while on a first date--be behaviorally measured outside of introspection, which when vocalized is "behavior?" Thompson's view on the matter is that they might be measured by "recording the electrical/mechanical activity of the vocal apparatus" which is a consequence of neuronal process that "is" thoughts. Thompson expands the range of behaviorism by pointing out that the "important advances made in cognitive psychology are all due entirely to careful measures of behavior." And who could argue with that point? How else could the inner workings of the mind be observed? Yet, there is an inner voice in me that whispers, No one can ever tell (or measure) your conscious thoughts, not even Alan Gevins's home EEG machine. It would seem that Watsonian "behaviorism" and "cognitive psychologists" share some common features and, as Smith implies, during the innocent early days of cognitive psychology, measurements of memory were based on performance, not the underlying neural function. (Solso, 308-309)

Richard F. Thompson, in the chapter titled *Will the Mind Become the Brain in the 21st Century?*, wrote about sub vocal speech and included this footnote: Jacobson, E. (1931). Electrical measurements of neuromuscular states during mental activities: VII. Imagination, recollection and abstract thinking involving the speech musculature. *American Journal of Physiology*, 97, 200-209. Thompson wrote:

If any one feature characterizes the modern "cognitive revolution" in psychology it is the profusion of loose writing and thinking about the "mind," what Skinner (1990) referred to as the "ghost in the machine." To me, the current situation is somewhat reminiscent of the state of introspectionism in psychology at the time when John B. Watson was required to describe the sensations, feelings, and thoughts of his rats as they learned to traverse a maze for his Ph.D. thesis (see Boring, 1929; Kimble, 1994). My field is behavioral neuroscience, the attempt to understand the neurobiological substrates of behavior. I was trained in a thoroughly behavioristic tradition in the psychology department at the University of Wisconsin in the 1950s, the heyday of such distinguished behavioral scientists such as Harry Harlow, Wulf Brogden, and David Grant. At that time the department was known far and wide as the "dustbowl of empiricism," a description that pleased Harlow so much he had a chamber pot so inscribed displayed prominently in his office.

I begin my discussion of brain and mind with my favorite quotation from John Watson's "Psychology as the Behaviorist View it" (1913). After stressing that measurable behavior is the proper object of study in psychology, he says:

Will there be left over in psychology a world of pure psychics, to use Yerkes'

term? I confess I do not know. The plans which I most favor for psychology lead practically to the ignoring of consciousness in the sense that the term is used by psychologists today. I have virtually denied that this realm of psychics is open to experimental investigation. I don't wish to go further into the problem at present because it leads inevitably over into metaphysics. If you will grant the behaviorist the right to use consciousness in the same way that other natural scientists employ it--that is, without making consciousness a special object of observation--you have granted all that my thesis requires. (Watson, 1913, p.175)

Watson's statement can hardly be called doctrinaire and must come as a surprise to those ardent cognitive scientists who decry behaviorism. The basic point he makes, and it is the thesis of my chapter, is that terms like "consciousness" and "mind" do not refer to phenomena that are in principle unmeasurable. At present, they can only be studied indirectly by measuring behavior, verbal and otherwise. By "a special object of observation" I believe Watson had in mind the method of introspection and the view then prevalent in psychology that mind/consciousness was somehow nonphysical, the traditional mind-body dualism. As Watson notes, this "leads inevitably over into metaphysics." The view of mind as nonphysical cannot of course be entertained in science.

My editor and colleague in the field, Robert Solso, is of the opinion that there is more to consciousness than meets the eye, that is, than is measurable: "this more difficult form of consciousness deals with 'inner thoughts' which are jealously concealed from observation. Such things as what a boy (or girl) might be thinking while on a date or a student may be thinking while talking with his professor. It is the private world of consciousness that poses the major issue in contemporary psychology, not the one that can be measured by implicit memory experiments and priming ..." Solso (personal communication, 1 February 1996).

Watson actually provided the solution to this issue of private thought many years ago with his motor theory of thought. Again, to quote Watson: "The hypothesis that all of the so called 'higher thought processes' go on in terms of faint reinstatements of the original muscular act (including speech here) and that these are interpreted into systems which respond in serial order (associative mechanisms) is I believe, a tenable one." (Watson, 1913, P. 174).

It is indeed the case that thinking in normal adult humans is accompanied by movement of the vocal apparatus: subvocal speech. Jacobson recorded electromyography activity from the tongue and was able to determine from this measure whether the subject was thinking of the word "one" or "two" or "three." (Jacobson, 1931).

The more extreme Watsonian view that these movements, per se, *are* thought is probably not correct (see Thompson, 1994). But to return to Solso's point, so-called thought can indeed be measured by recording the electrical/mechanical activity of the vocal apparatus, activated in turn by the neuronal processes that "are" the thoughts. Again, my thesis is that there is nothing more to thoughts than neural activity and its outward expressions in behavior.

...

Jacobson, E. (1931). Electrical measurements of neuromuscular states during mental activities: VII. Imagination, recollection and abstract thinking involving the speech musculature. *American Journal of Physiology*, 97, 200-209. (Solso, 39-41)

The Commission meeting excerpt is below. The relevant excerpt of Dr. Farah's talk is posted on the Presidential Bioethics Commission website here: <http://www.bioethics.gov/transcripts/ethics-of-genetics-and-neuroimaging-testing/022811/ethics-of-emerging-diagnostic-and-predictive-tools.html>. The panel discussion took place February 28, 2011 and was titled: *Ethics of Emerging Diagnostic and Predictive Tools*.

Martha Farah, Ph.D. : Walter H. Annenberg Professor in Natural Sciences; Professor of Psychology; Director, Center for Cognitive Neuroscience; Director, Center for Neuroscience and Society; Senior Fellow, Center for Bioethics University of Pennsylvania

Lisa:

— and I'm just here because I'm interested. My question is for Dr. Farah. You mentioned that we're a long way from mind reading. Yet, a couple of years ago I saw on the History Channel they showed a mute paraplegic where they had implanted a chip in his throat. His thoughts were going onto a computer screen. Maybe I'm confused as to the difference between mind

reading and being able to capture human thoughts onto the screen. I'll let you respond.

Dr. Gutmann:

Great question. Thanks.

Dr. Farah:

Okay. Well, I'm thinking there are two possible technologies that you — again, it's very strange to talk to somebody with your back to them. Forgive me, Lisa. There are two possible technologies that you could be talking about.

One does sense microscopic movements in the vocal apparatus and basically looks at subvocalization. It's basically a way of just using speech that you can't hear. I think it would be a cheat to call that mind reading. There have also been some early human trials of chips implanted in the brain on parts of motor cortex that allow a paralyzed person to move a robotic arm or move a cursor on a screen or type a message on a computer screen using thought alone by basically learning to kind of think about movements and direct the cursor or the robotic arm accordingly. There is a sense in which that's mind reading but consider this. It's basically translating brain activity into movement in at most three-dimensional space. Nontrivial but, you know, to read a thought like Hank is thinking now, "Oh, poor Martha. She blew it again. She went over and the Chairman had to tell her to end early."

That kind of thought if you think of it as a spatial analogy is a point or a path in an extremely high dimensional space. All the different dimensions of meaning and intention that a person could conceive of, that is what we are a million lights years away from doing.

"NPR : '1996': Under the Watchful Eye of the Government"

[Mind Justice Home Page](#)

News & Notes with Ed Gordon, January 23, 2006 · Ed Gordon talks with writer Gloria Naylor about her latest novel 1996, a fictionalized memoir about Naylor's experience under government surveillance.

<http://www.npr.org/templates/story/story.php?storyId=5168026>

(A special thanks to Ted Jackson for the transcript of the NPR radio interview of Gloria Naylor.)

Interviewer - The novelist Gloria Naylor is best known for writing critically acclaimed African American literature including "The Women of Brewster Place", however Naylor's latest offering falls into that ambiguous category some call fictionalized memoir. What's more, this somewhat true personal story is centered around Naylor's conspiracy theories about government surveillance and mind control. The book is titled "1996". That's the year it first became apparent to Naylor that she was being spied on.

Gloria - Since many of these things did happen to the real Gloria Naylor, by using myself as a protagonist, I was able to have the book act partly as a catharsis. Basically, what 1996 is about is our loss of privacy in this country that the government has moved well beyond just the simple following of people and the tapping of their phones, but they now have technology that is able to decode the brain patterns and to detect what people are actually thinking. And they have another technology called microwave hearing where they can actually input words into your head bypassing your ears. Now, both of these technologies are documented and people have patents for part of the process, so what I wanted to do with 1996 was to say to my fellow Americans that we have to be vigilant about any attacks on our civil liberties, even innocuous attacks, because they can snowball and lead to other things.

I - Now, we should note the book is centered around an island off of South Carolina where you go to enjoy life there and write and tend to a garden and then as the account of the book suggests, your tranquility is ruined.

G - I realized at some point that I was being followed and then I began to see the surveillance that was going past the road on my house and so these cars began to surveill me and people began to follow me around and it was very disrupting to think that your privacy was being violated and for no reason that I could come up with, since I'm not basically a political writer. I'm a fiction writer for the most part. And so I just didn't... I didn't understand that I knew about COINTELPRO, because I'm African American and in those years the FBI did many shameful things to disrupt black nationalist organizations. But since I was not part of any of that, I thought that I would be immune basically from the government having any interest in me.

I - But let me play devil's advocate, Gloria. There are going to be people who are going to say just based on what you just said, "Why would the government follow you, what interest would they have, etc. etc. Here's a woman who's just simply borderline paranoid."

G - Well, what I can say to them is this. It's the same thing that happens when a child is abused by a trusted adult. Now that child will go to some parents and tell them these things. They will be believed by some of the parents. Some of the parents will never believe that Uncle George could be doing these things to their little girl. So, it's either that you're going to believe me or you're not going to believe me. And I couldn't worry about that. I'm worried about it a little bit to be truthful to you. The people will think, "Well she just had a nervous breakdown". But when I really sat and thought about it for a long time, I realized I can't worry about what reception this news is going to be received in. I wrote what I felt I had to

write, and I'm willing to put my own sanity and my reputation behind it.

I - And why you?

G - I have no idea why me. I think I just ran into the wrong people at the wrong time and like the book shows, what starts with a very innocent dispute with a neighbor cascades and cascades and cascades into a whole production.

I - Gloria, let me get your thought when a couple of weeks ago you saw the headline like most of us did about the White House and the tapping of American citizens. With this book, you must have, not been surprised, but I would think it caused you to sit straight up.

G - I was surprised that it even came out and like the New York times they sat on the story for a whole year and that's part of why we don't know the truth of many of these black operations that go on and because of one patriotism of some people within the news media, because of the improbability that you would be believed, if you became a whistle-blower. All of that lets these abuses flourish. The intelligence community for the most part has no accountability at all to the congress and to us the American People. And so they feel that they are above the law. And every blue moon something like this Times manifesto will come out and people will say to themselves, "My God, I had no idea that's going on." What I believe is that a lot more than that is going on. This is just the tip of the iceberg that happened to get exposed.

I - Fiction writer Gloria Naylor. Her latest book is titled "1996"

Psychotronic Golgotha

by N.I. Anisimov, 1999

[Also see pictures from the book](#)

[Mind Justice Home Page](#)

Twenty-five pages of the seventy-two page book, generously translated by Ramon Ruelas, copyright.

The Russian author, N.I Anisimov has been interviewed in several mainstream Russian press articles in the 1990s as the spokesman for a Russian group of 'mind control' or psychotronic victims. He has appeared in the 1998 ZDF German TV documentary, "Zombies of Russia". Anisimov has been quoted by Foreign Military Studies Office, military analyst, Timothy L. Thomas in the Parameters, US Army War College Quarterly Vol. XXVIII, No.1, Spring 1998 article, "The Mind Has No Firewall".

Anisimov describes the history of psychotronic weapons, the weapon effects, who is targeted in illegal experiments in Russia, who is developing the weapons and the extent of the problem.

Table of Contents

- Psychotronic Weapons
- Humanitarian Weapons - A Plague of the 20th Century
- Scientific Cannibalism, Psychotronic Weapons and Diabolical Technologies
- Totalitarian Sects - A Range for Testing Psychotronic Weapons
- Rights-defenders Anticipate - Watching Television is Dangerous!
- Wizards, Witches and other Evils Under the Roof of the Government Administration
- Aliens, [***], [Baba-Yaga and Other Devilries
- Contemporary Exotic Types of Weapons
- The Computer is Destroying Mankind
- Certainty in Complete Non-punishment or a Bandit's Farce?
- Vampires in White Dressing Gowns
- Yellow Gulag and Psychotronic War
- Towards a Backward Thinking In the Name of Stopping the Bio-robotizational Madness
- KPSS Central Committee and KGB Plan: "Psychotronic Golgotha"
- Your Brain, Your Private and Intimate Life are Under the Control of the Secret Service
- The White House in a Psychotronic Dimension
- "Ch" Hour *
- Dispassionate Codes Strike out in Alarm
- Customers and Manufacturers
- The Conducting of Political and Governmental Secret Terrorism
- Crazy "Little Vodka"
- An Electronic God Blindly Punishes and Pardons
- Free Will for Citizens, Democratic Elections are Impossible Under Conditions of Psychotronic Applications on the Population
- On the Quiet to the Authorities: On the Scenario of the Model of the Puppet Theater
- Murder will Out
- The Threat to National Security Demands the Urgent Adoption of Laws
- Notes on the Sources of Information Used in this Book

Psychotronic Weapons

At the dawn of the scientific-technical progress, dictators and rulers of totalitarian governments dreamt about how to embody the most ancient occult sciences and hidden potentials of mankind's psyche in technical weapons in order to, with their help, make their own populations obediently conformist, blindly fulfilling the wishes of the dictator and his associates. They even cherished monstrous ideas, after the creation of super-

weapons, of using these for the enslavement of other governments and of becoming rulers of the world. With the creation of such types of weapons the military has been receiving the ideal weapon of mass enslavement and destruction, and the Secret Services an ideal zombie agent capable, without portable radio sets and guns, of obtaining and conveying secret information. But if at the end of the past century, the embodiment into life of these dreams -given the weak development of technology -was not possible, then already by the start of the 20th century, when scientific-technological progress was becoming intensively developed, these dreams came to be realized into practice.

One of the founding fathers of these national psychotronic weapons became the academician V. Bekhterev. In 1925 B. Bekhterev's group conducted the first experiments on the collective suggestion of emotions over a distance. Mass suggestion was achieved with the radio-set. A considerable contribution in the creation of these diabolical weapons was introduced by the daughter of F. Dzerzhinskovo M. Tal'tze and the docent D. Luntz. They were engaged in the development of combined psychotronic technologies that were based on imported special narcotic preparations and technical apparatuses. In the capacity of guinea pigs they employed prisoners of Lubjanka and patients of the psychiatric institutions. With the invention of the television, there appeared the possibility of the mass psychotronic treatment of the population by mean of television sets. After the fall of fascist Germany, the scientific research in the area of the creation of psychotechnological weapons fell into the hands of the Soviet military and the Chekists, and they gave a significant push to the creation of national psychotronic weapons.

At the end of 50 years, contemporary national psychotronic weapons emerged from the laboratories of the secret NII and began to appear in the arsenals of the secret service and the military. At the same time, in the "List of Knowledge Prohibited from Publication," the point was introduced regarding the prohibition of the open publication of material about technical devices intended for influencing of the behavioral functions of a person and about the possibility of controlling the behavior of a person. At the end of 70 years, psychotronic weapons started to come off the conveyors of assembly lines of secret factories to be used against the population on a mass scale. At the end of 80 years, the first rights-defense movement in the country came to be created, leading to the uneven struggle against the monstrous criminals of the century.

Humanitarian weapons

A plague from the 20th century

Psychotronic weapons are related to one of the types of the so-called "nonlethal" weapons. Their invisible components can kill at a distance, imitating or causing any chronic illness, they can make a person a criminal or irresponsible, create aviation, railroad or automobile accidents in a matter of seconds, destroy fundamental structures, destroy, create or provoke any climatic cataclysm, control the most complex instrument or mechanism, control the behavior of people and any biological object and change the world-view of the population.

Inquiry. Non-lethal weapons are composed of the fourth type. The first type are taken from a series of military technologies and structures along the path to changing the molecular structure of material, the reduction of its stability, the altering of physical-chemical properties, but also to put out of service any apparatus or any mechanism by destroying the functioning of radio-electronic devices. The second type put out of a order only living powers, permitting the destruction of the psyches of the enemy, the coordination of body movement, muscular tone, the change in the functioning of various systems of the body, among them the cardio-vascular system and visual apparatus. Radio-sound is employed that is capable of lulling to sleep large contingents of enemy troops and of optical-generating capabilities for the projecting into the atmosphere holographic monstrous images to demoralize enemy soldiers. Holographic images of "the grim reaper" and armadas of "UFOs", an artificially created crimson-red setting sun and the appearance of images of the moon during the daytime, or artificially created unpleasant climatic conditions in specific places where military activities are underway, undo the psychological processing of the enemy and create panic. With over-doses of the given effects are caused trauma to organs that are not treatable, mental damage that is non-treatable, and an increase in the number of invalids. To the third type are related psychotronic weapons. The fourth types are based on anti-gravitational technology. The principle of gravitational types of non-lethal weapons consists in that any object can be artificially deprived of the earth's natural attraction and become an obedient toy in the hands of an operator sitting at the control panel of the gravitational weapons. Military technologies created on anti-gravitational technology possess the highest maneuverability of any of the most modern and exotic weapons. The first and second types of non-lethal weapons -at the end -are not classified, but the third and fourth -from previously -are officially considered Secret.

More than 20 years ago, starting with the first secret research in the area of the creation of non-lethal weapons, the government and the Secret Services foresaw with concern that in the case of even the minimal declassification, information about similar types of research carried distortions or a veiled nature that did not cause the international society to prick up its ears in concern. At the present time, such a time has arrived. And military scientists connected to its development, complying with secret directives, attempt to present its type almost as a blessing for mankind, fondly call their eccentric weapons nonlethal, bloodless weapons -or a humanitarian bomb. With this they are attempting to pass themselves off as upright, infallible citizens, pretending to be generally respectable and accountable. This untruthful information -and cynicism to the highest degree - is easily fed through several of means of mass information, in many cases achieving the aim of taking hold in the minds of uninformed citizens, and serves as a preventive defense for the criminals who are employing these types of weapons against the population on a mass scale. In connection with these and a host of other circumstances, today nonlethal weapons do not come under even one of the international conventions which would prohibit the development, accumulation and applications of such types of weapons.

Scientific Cannibalism, Psychotronic Weapons and Diabolical Technologies

Inquiry. The direction of secret scientific-research of institutes that are working on the creation and perfection of psychotronic weapons:

1. Physics
2. bio-physics
3. bio-chemistry
4. psycho bio-physics
5. bio-cybernetics
6. radio-electronics
7. psychotronics
8. biology
9. medicine
10. Outer-Space

Secret NII is taking on the following [general] tasks: geo-political, ideological, military, police [law enforcement], medical-biological, scientific research, production-farming, the expert appraisal of conducting a psychotronic war. Narrow [high] specialization:

- a. development of technological means of distant control and management of the thought processes of humans
- b. the perfection of technologically distant control of the behavior and organisms of man with the help of apparatuses used in the capacity of directing sources of electromagnetic, magnetic fields and acoustic waves
- c. the use of telekinesis of a techtronic character for the influencing of a technological system
- d. the development of devices with the aim of the distant control of behavior of humans, with the use of the implanting into the brain and body of electronic data
- e. distant control of the behavior of people with the use of pharmacological means along this schemes: introduction in the human body of pharmacological means (behavior modification), and afterwards the distance-influencing by psychotronic apparatuses for the modification of the body of humans
- f. the perfection of technological, distant transporting into the body of a bio-object chemical and other object matter
- g. the distant control of people with the use of radio and television
- h. the creation of a bio-robot
- i. the perfection of technology for erasing information from the brain
- j. the distant physical and biological influencing of a living organism by electromagnetic, magnetic fields and acoustical waves
- k. the distant influencing of particular factors of the surrounding environment and on the growth of animals and humans:
 1. Geo-political tasks: development of systems of distant control of third countries, expert appraisals of the creation of geo-political hotbeds of tension and their location
 2. Ideological tasks: the distant influencing of populations with the aim of the creation of a law-abiding society loyal to the existing governmental order and political system
 3. Military tasks: expert appraisals of the conducting of psychotronic war against enemy

governments, technological defense of troops and populations from the destructive factors of psychotronic weapons, coordination of the applications of psychotronic weapons with other types of non-lethal weapons, the coordination of psychotronic weapons with other types of contemporary weapons, the coordination of army units.

4. Police (law enforcement) tasks: control and management of criminal group and of individual criminals, investigations and operational activities, suppression of protests and demonstrations, coordination of the Secret Services.
5. medical-biological tasks: new technological treatment of illnesses with the use of psychotronic apparatuses and pharmacological means, the distant control of the health of the population, the distant control and management of people with mental deviations, the distant alteration of individuals at the genetic and psycho-physical level.
6. Space tasks: the taking out into outer space of psychotronic weapons (apparatuses) with the aim of controlling and managing the behavior of the population; the distant control and management of cosmonauts.
7. scientific research tasks: the development of new technologies of psychotronic weapons and psychotronic apparatuses, their interaction with the surrounding environment and pharmacological means.
8. manufacturing-farming tasks: the distant automatization of manufacturing-farming activities, the distant control of city communications and transportation.
9. Agricultural tasks: increase crop yields, control and management livestock.
10. Geological tasks: the distant search for useful minerals.
11. Climatic tasks: the distant control of annual conditions and cataclysms.

According to information received from the military-history academy, the period preceding the Second World War was a big period of time when the Soviet and German military scientists jointly developed chemical weapons, and in secret laboratories of the town of Vol'sk (Shikhany-1) they closely collaborated in the creation of weapons of psycho-technology. Those who know are few that in the years '20-'27 in the territory of the Soviet Union there were numerous joint Soviet-German aviation and armoury schools in which future fascists of the Axis were trained in military skills. The military-history academy names several such sites. For example, in the town of Lipkakh there was located the joint Soviet-German aviation school, and in Saratov region, the joint Soviet-German armoury school.

After the start of the Second World War, interest in the creation of weapons of psycho-technology enveloped practically all the military circles of the leading countries of the world. At the end of 40 years, applying the received developments, the military scientists of many countries of the world conducted innumerable tests on the creation of universal narcotics with the aid of which it would be possible to control the behavior of man. In the end, such a preparation was created. It was called LSD. In the year 1951 the Swiss company "Condor", having received the monopoly rights to its production, illegally sold the Soviet Union 50 million doses of the narcotic which were put into use immediately.

There is information that already the end of 50 years, for these very same goals, the Soviet scientists created an entire series of national, unique pharmacological preparations --behavior modifiers of special gases and chemical means. It is probably not difficult to figure out who were their customers and where they found their application. In the following years, special pharmacological centers continued to create still newer and newer behavior modifiers. Towards the end of 70 years, their production was received to a sufficiently wide extent and led to a full Secret classification of military installations that were engaged in its production.

There is information that medical workers employed at the Secret Service and VPK, with the conducting of surgical operations and vaccinations of the population, introduced into the bodies of patients, micro-schematic records that can be readily inserted into epidemic needles. After the introduction of such micro-schemes, the person becomes a radio-controlled bio-robot. According to confidential information, nearly 30 % of the population of the former Soviet Union carry in their bodies these micro-schemes.

Psychotronic weapons are a complex of unique electronic-irradiating apparatuses capable, over a large distance, of controlling the psycho-physical activities of a person, purposefully destroying his health. Psychotronic weapons are lofty, rational weapons which are applied in combination with other types of nonlethal weapons and psycho-technological weapons.

Inquiry: In the year 1995, at Prospect Mir, No. 36, in the Moscow Chapter of the Information Center for the Rights of Man, direction: Defending the Citizen from psychotronic terrorism, there took place a colloquium of scientists at which was adopted the decision: " In connection with the classification of weapons of psycho-

technology and the confusion about the terminology, all types and sorts of weapons capable of distantly controlling the psycho-physical activities of a person, which can change his surrounding environment when applied jointly, are called psychotronic weapons."

Destructive factors of psychotronic weapons are: torsion generators, SVCh-generators, lasers, acoustic and microwave apparatuses used as powerful energy sources for stationary and portable psychotronic stations located on Earth and taken into outer space, as well as in the surrounding environment, and also chemical and gaseous means. Focusing types of irradiations without hindrance, without losing the given strength, freely penetrate through any barrier and with a high degree of [accuracy in] striking the chosen victim at any distance. The effects are realized at the cellular-molecular level by methods of the psycho-physical treatment of the brain and organs of persons along the principle of associative and neuro-linguistic psycho-programming with the application of radio-acoustic effects and distance tomography. With psychotronic complexes are controlled super-IBM and staff-operators. Computer psycho-programming is conducted along the following schemes: operator-computer-victim and in the reverse sequence: victim-computer-operator. The exchange of information along these schemes carries the name bio-feedback ties (BOS). The effects exerted on a person can be realized in a positive, negative or a neutral regime. The irradiative components of the weapons can change the indicated instruments and chemical reactions that allow the terrorists a sufficient length of time to escape detection and punishment.

There exist three types of psychotronic influencing on a person: secret, open and combined. With the secret influencing the victim does not know and does not even suspect that his brain and organs are being subjected to distant influencing. All external thought-transmissions he takes as being his own, all conditions of illness are related to as natural illnesses and to the poor state of his health. Such a person-victim, being under influencing through his psyche, can commit any crime that comes to his mind; under the manipulation of the brain, he adheres to one and then to another political grouping. It is easy to lead such a person-victim type to any psychological state, a state of irresponsibility, and to imitate in the victim any mental illness. With this the person will think that he himself achieved the criminal thoughts that came to his mind, that he himself has such and such a political viewpoint and persuasion, that he himself became ill from an illness. Such a person is a bio-robot since he (no one knows why) fulfills the wishes of the criminal. Such a person-bio-robot is the greatest danger for any society. Secret methods of influencing are the basis for controlling a large mass of the population. With the open method of influencing, the person-victim knows and understands that his brain and organisms are being subjected to psychotronic influencing. To such a person is artificially attached and grafted special systems of arrangement, being capable of extracting from his brain and introducing into him information at the speed of his psycho-programming, and in several cases also capable of reprogramming in full or partially rebuilding his personality and his bio-robotization. The person-victim intended for this type of goal very often cannot distinguish his own thoughts from those artificially introduced. But usually the bio-robots are created with the application on the victim of secret influencing. Besides secret and open methods, there exists also the combined method, when the brain of the victim is under secret influencing while the body is under open influencing. Open and combined influencing are realized by methods of manipulation of the judgment on the principle of Yes-No, manipulation of the psyche in conjunction with manipulation of functions of internal organs and of the whole body. Usually for the victims of open and combined influencing are brought in operators creating the newest type of psychotronic weapons and who are conducting medical-biological and pharmacological experiments.

For the guaranteeing of safety of psychotronic technology they have two basic types of defenses -the so-called alibis. The first type of defense consists in the fact that open and combined influencing are realized along the principle of studied clinical illnesses. Usually this type of defense is used by the involved terrorist in the cases that the victim turns to law-enforcement organizations and to doctors. As a rule, after the becoming familiar with them, the victim ends up in a psychiatric hospital, and upon leaving the victim forever has acquired the status of an insane person with the surety that the condition will be explained on a psychiatric basis. The second type of defense consists in that the capabilities of the weapons momentarily are attached to any person appearing with the victim in connection with the resulting changes in his thinking and his behavior. As a result of employing this type of defense, officials, even if they are not connected to the criminals, are not going to correctly and logically perceive information received by them from the person undergoing the experimentation. For a more hopeful guarantee of an "alibi", and for the realization of a specific determined program, the victim is previously worked on by secret methods. Unnoticed, they attached to his bio-fields and they study his intellect, his psychological type and, depending on the program to follow, artificially induce in him various illnesses of his internal organs -they create conflicting situations in daily life and at work which, during the time of open and combined influencing, will also serve to veil it.

With the realization of influencing and terror, the criminals practically in all cases follow a basic rule: all

artificially created situations should have a reason and consequences, even if the artificially created reasons appear absurd and the consequences unnatural.

There exist three stages of psycho-programming. The first stage -control of the brain. The second stage - control of the psycho-physical activities of the person. And the third stage -the elimination of the person under experimentation. To the third stage terrorists come running in the following cases: the danger of being exposed, worked out material, fear, and the artificial stabilization of the size of the population. The elimination could be realized by traditional, as well as by non-traditional methods.

All national psychotronic programs carry a coded name:"zombie". But if earlier the term "zombie" meant a person bio-robot whose brain had been rigidly coded with the help of narcotics and special psychological influencing, then in contemporary interpretation "zombie" implies an abbreviation which is deciphered as: secret object of medical-biological research. Why secret? This is because of the costs of the person under testing speaking to those around him about what is going on with him, as in matters that appear in all the above described types of defenses. The person under testing, being under the control and command via the psyche, is outwardly little different from ordinary people. Psychotronic terrorists vigilantly track him in order to ensure that he remains secret up to his very death.

Psychotronic weapons by their own specifications are at the root different from other types of weapons. If an automatic Kalashnikova could have been invented, approved and perfected at the shooting range, then for the development of psychotronic weapons people-donors are constantly required. Any person could become a donor if his intellect and physical characteristics are required by the terrorists. The selection of donors is achieved according to the following principle: it is known that human society is composed of specific groups with their own intellects and psychological types. Every person is a representative of such a group. The selection of donors for open psycho-programming and the treatment of him with psycho-technology could secretly control the behavior of the entire group and consequently all the society in its entirety.

But psychotronic weapons have long ago emerged from the testing stages. They were transformed into monstrous weapons of mass repression, destruction, and elimination. Psychotronic military weapons are called super-weapons, ultra-weapons --weapons of the fifth generation.

Inquiry. In the former USSR over the course of more than 30 years there has been conducted a secret undeclared psychotronic war by the communist regime and its followers against its people. At the present time in records of governmental departments, rights-defense organizations and in means of mass communication, there exist more than one million victims of open psychotronic terror and psychotronic influencing.

Usually people who become victims are gifted people not loyal to the regime, servicemen from military subdivisions, athletes, those held in prisons and concentration camps, people who make up the ranks of dispensaries, without exception prisoners of psychiatric hospitals, and also the population in free behavior. For the covering up of the crimes and for the shifting of the responsibility to the USA and Mafia organizations, to open psychotronic terror are also subjected portions of the communists and employees of the Secret Service.

Psychotronic terror, realized openly in relation to the selected victims is conducted every second, around the clock and over the course of many years along the principle of the activities of an executioner in the middle ages -- torture chambers and "works" of researchers of the VChK- KGB in communist torture chambers in the same terrible years of the history of our much suffering country. Contemporary executioners embody in the technology of psychotronic weapons the entire enormous arsenal of torture handicraft. For terrorists the person under testing represents an ideal target upon which the invisible rays-impulses fall, inflicting traumatic blows. Sometimes in sadistic ecstasy, the terrorists with particular cruelty torture their victims for a sufficiently long enough time. The *brain jailers* climb [*samoe svjatae****] intimately and secretly, with electronic-ray whips, punishing him for disobedience. With the shouts of the defenseless person for help, he is appraised by the law-enforcement agencies and those around him as a raving lunatic. There is created a distinctive psychotronic hood, electronic-ray tentacles which entirely keep their own victims in firm isolation from the rest of the world around him. Distant control and the constant stimulation of important life-sustaining areas of the brain and organs allows for a quick get-away for the killers of the person under testing. { **that line is not clear**}; As a rule the terrorists treat the entire genetic tree of the selected victim. But if the very victim is terrorized by the open method, then his immediate family and his relatives are treated secretly along a more merciful program in which there prevail [directions for misunderstood problems]. { **Not positive re: what is in brackets**}

With the realization of the psycho-programming and terror, the criminals strictly adhere to the basic principle of psycho-com-fascism which consists of the gradual suppression and destruction of the person in a psycho-physical plan, as with the personality and the destruction of his I. If the person possesses any positive qualities, then he is converted into the total opposite. For example, if the person possesses a good intellect then he is transformed into a totally "degraded" person, athletes are transformed into invalids, "beauties" into "uglies", sociable people into reserved persons, and neat persons are changed to untidy people, etc.

Inquiry. Results of scientific research in the area of the study of influences of electro-magnetic fields and acoustic waves on the psycho-somatics of a person completely coincide with the sensations of victims of psychotronic weapons. In both cases there is present: tightness and sharp head pains, dizziness, pressure on the eardrums, oscillations (vibrations) of the walls of the peritoneum and rib-cage and of individual groups of muscles; dryness of the mouth, pain in teeth and gums, difficulty swallowing; dampness in the hands, muscle pains and aching bones; tremors of the extremities, painful sensations in the sex organs and anus, arousal of sex organs, depression of sex organs; arrhythmia, an increase or decrease in arterial blood pressure; a decrease in visual acuity; coughing; an increase or decrease of the body temperature; coma; itching; bursting of tissue; modulation of speech; occurrences of fears, anxiety, etc. With the purposeful irradiation, the above-described sensations can easily be significantly controlled in their expansion, purposefully influencing any portion of the brain and organs [in order] to use the person in the capacity of a radio-controlled model. The list of artificially created illnesses and damage to the health of the person undergoing testing completely coincide with the list of illnesses and damages to the health of the person subjected to electro-magnetic and acoustic irradiation. According to this list, the most widespread are: malignant new growths, damage to the cardio-vascular system, coagulation or disintegration of the blood, illnesses of the brain, a functional change or a destruction - up to the point of being lethal - in the peripheral and central nervous systems, eye illnesses, illnesses involving the sex organs, a deterioration of movement-support apparatus, a breakdown of the rib-cage, damage or rupture of organs, muscle atrophy, a destruction of the endocrine system, damage to the skin, [*** *troficheskie*] damage -- hair loss, brittleness of the nails, etc.

Information for consideration

Practically all technologies for psycho-programming of people foresee compulsory harsh treatment of the psycho-energetic centers man, included among these: the heart, organs of [inclination*] in the peritoneal area, sex organs, prostate gland, the womb and its appendages, the spine, the cerebellum, the left and right hemispheres of the brain, the frontal lobe, visual and other sense organs and the vocal cords.

Inquiry. According to official statistics in the countries of the former USSR, there is practically not even one person who did not suffer from some kind of chronic illness. The most common are composed of: illnesses of organs of [inclination*] in the pelvic area, mental and nervous disorders, oncological and cardio-vascular illnesses and illnesses of the eyes and of the movement-support apparatus.

Totalitarian Sects: Laboratories for Testing Psychotronic Weapons

The most significant example of the applications of psychotronic weapons on a mass scale would be served by the recent exposure of the totalitarian sect "The White Brotherhood," financed by the Minister of Defense and the KGB-FSB. The Minister of Justice of the country of the former USSR, Russian Federation, liberally registers hundreds of totalitarian sects supplying them with psychotronic weapons, among which are the international terrorist sects of "Aum Sinrike", having the most technical ties with the Russian Secret Service and military. This sect conducted mass zombification of populations, employing the Russian radio station "Majak". The leaders of the sect, complying with the directives from the military and Secret Service and from the powers that be, crippled hundreds of thousands of children, transforming them into bio-robots. In the terrorist country of the former USSR, there functioned hundreds of Secret Service schools, the students of which were subjected to neuro-linguistic programming.

Rights-defenders Warn that Watching Television is Dangerous!

Over the course of several decades, for the creation of a conformist-obedient population are used the means of mass communication: radio, television, and cinematography. Bio-signals built into the frames of motion picture and texts unnoticeably influence the subconscious of a person and form in the population a definite stereotypical world-view, depending on the political goals of those who are in power. Such type of treatment

of the population has for a long time and successfully been employed for control by the KGB-FSB.

In the USA and Japan, the employment of the means of mass information for the modification of the behavior of the population is prohibited, since the effects of bio-electronic signals on the brain and organs of the body of a person inflict irreparable damage to his health, permitting the transformation of people into bio-robots and represent an infringement of the rights of people. In recent times, "subliminal cassettes" have appeared in commercial sets on which special methods of recording texts influence the subconscious of a person and help to formulate his world-view.

Wizards, Witches and other Evils Under the Roof of the Government Administration

In the former USSR, Russian Federation, in only one year -1988- there appeared thousands of "treatment" centers for non-traditional medicine, equipped with ultra-modern medical and psychotronic apparatuses issued out of secret factories. These centers widely used occult sciences which represent the basis of psychotronic technology. As a rule, the heads of these centers were secret, but the service personnel each had two kinds of higher education -- medical and technological. Surely it would not be hard to surmise where, when and by whom were created these unique apparatuses. For example, medical scientist -and at the same time a physic -I. Smirnov conducted experiments on prisoners from one of the psychiatric treatment centers in Moscow with the use of a psychotronic generator, the director of *IKEMa SO AMN USSR*, the academician V. Kaznacheev and his colleagues conducted medical biological-technological experiments on patients of their clinic and population of the town of Novosibirsk, while the academician N. Bekhtereva and her colleagues on patients of a clinic having her at its leadership at her " *Mozg*" center, etc. Centers, with the blessings of the Minister of Health, would daily turn out thousands of zombie retransmitters with "sorcerer" diplomas in their pockets. { **I think this is what is meant re: Mozg center..**}

The tele-seances of Kashpirovskii, Chumaka and other miracle-workers enter into a single global system of developers of psychotronic weapons and are nothing other than obedient toys in the hands of criminals, maniacs sitting at the controls of technological psychotronic weapons. If anyone has any doubts as to the accuracy of the above written lines, then the person reading them should consider Kashpirovskii and others, or wizards and witches, or sorcerers and magicians, and hang their images either next to Baba-Yagi or with Nikolai Ugodnik.

Giving out licenses to characters supposedly possessing magical charms, the leadership of the Ministry of Health simultaneously negates any possibility of manipulating people. Few of those from all who make declarations about any external influencing having effects on them, the doctors again, with the blessings of the Ministry of Health, subject them to forced "treatment" in psychiatric stations where they conduct the most dreadful psychiatric diagnosis. The inadequateness and illogicalness of such operations of these "highest" doctors not only do not fall under any kind of logic but also usually not even by most primitive of concepts. In connection with this, the conclusion suggest itself : that governmental departments, called upon to stand as the guardian of the health of the people, appear to be direct participants in these abominable crimes.

* [inclination] best I could come up with. Same with "Frontal lobe" in the same section.

*** troficheskie -no luck finding this.

U.S. Explores Russian Mind-control Technology
U.S., Russia Hope to Safeguard Mind-Control Techniques
by Barbara Opall, Staff writer

U.S. Explores Russian Mind-Control Technology

Washington-The Russian government is perfecting mind-control technology developed in the 1970s that could be used to hone fighting capabilities of friendly forces while demoralizing and disabling opposing troops.

Known as acoustic psycho-correction, the capability to control minds and alter behavior of civilians and soldiers may soon be shared with U.S. military, medical and political officials, according to U.S. and Russian sources.

The sources say the Russian government, in the spirit of improved U.S.-Russian relations, is beginning to lift the veil of secrecy surrounding the technology.

The Russian capability, demonstrated in a series of laboratory experiments dating back to the mid-1970s, could be used to suppress riots, control dissidents, demoralize or disable opposing forces and enhance the performance of friendly special operations teams, sources say.

Pioneered by the government-funded Department of Psycho-Correction at the Moscow Medical Academy, acoustic psycho-correction involves the transmission of specific commands via static or white noise bands into the human subconscious without upsetting other intellectual functions. Experts said laboratory demonstrations have shown encouraging results after exposure of less than one minute.

Moreover, decades of research and investment of untold millions of rubles in the process of psycho-correction has produced the ability to alter behavior on willing and unwilling subjects, the experts add.

In an effort to restrict potential misuse of this capability, Russian senior research scientist, diplomats, military officers and officials of the Russian Ministry of Higher Education, Science & Technology Policy are beginning to provide limited demonstrations for their U.S. counterparts.

Further evaluations of key technologies in the United States are being planned, as are discussions aimed at creating a frame-work for bringing the issue under bilateral or multilateral controls, U.S. and Russian sources say.

An undated paper by the Psychor Center, a Moscow-based group affiliated with the Department of Psycho-Correction a Moscow Medical Academy acknowledges the potential (?) of this capability.

U.S., Russia Hope to Safeguard Mind-Control Techniques

Control, From Page 4

The Russian experts, including George Kotov, a former KGB general now serving in a senior government ministry post, present in their report a list of software and hardware associated with their psycho-correction program that could be procured for as little as \$80,000.

"As far as it has become possible to probe and correct psychic contents of human beings despite their will and consciousness by instrumental means; results having been achieved can get out of { our} control and be used with inhumane purposes of manipulating psyche," the paper states.

The Russian authors note that " **World opinion is not ready for dealing appropriately with the problems coming from the possibility of direct access to the human mind.**" Therefore, the Russian authors have proposed a bilateral Center for Psycho-technologies where U.S. and Russian {?} restrict the emerging capabilities.

Janet Morris of the Global Strategy Council, a Washington-based think tank established by Ray Cline, former Central Intelligence Agency deputy director, is a key U.S. liaison between Russian and U.S. officials.

In a Dec. 15 interview, Morris said she and the Richmond, Va-based International Healthline Corp. have briefed senior U.S. intelligence and Army officials about the Russian Capabilities, which Morris said could include hand-held devices for purposes of special operations, crowd control and antipersonnel actions. Healthline Corp. is evaluating Russian health care technologies and will underwrite Russian demonstrations in the United States.

"We talked about using this to screen and prepare special operations personnel for extremely difficult missions and ways in which this could be integrated {?} for psychological operations," Morris said.

She said Army officials were concerned about the capability being directed against armored systems and personnel through electronic communications links. Ground troops, she said, risk exposure to bone-conducting sound waves that cannot be offset by earplugs or other current protective gear. Morris added that U.S. countermeasures could include sound cancellation, a complex process that involves broadcasting oppositely phased wave forms in precisely matched frequencies.

Major Pete Keating, a U.S. Army spokesman, said senior Army officials had expressed interest in reviewing Russian capabilities but that repeated plans to schedule visits to the former Soviet Union were rejected by Donald Atwood, deputy secretary of defense. Keating said he was unfamiliar with the mind-control technology {?} specific details.

U.S. sources said government officials and leaders from the business and medical communities will consider Russian offers to place the mind-control capability under bilateral controls.

At least one senior U.S. senator, government intelligence officials and the U.S. Army's Office for Operations, Plans and Force Development are interested in reviewing the Russian capabilities, U.S. sources said.

In addition, International Healthline Corp. is planning to bring a team of Russian specialists here within the next couple of months to demonstrate the capability, company President Jim Hovis said in a Dec. 2 interview.

Meanwhile, the U.S. Army's Armament Research, Development & Engineering Center is conducting a one-year study of acoustic beam technology that may mirror some of the effects reported by the Russians.

Army spokesman Bill Har? said Dec 3 the command awaited the one-year study contracted Scientific Applications & Research Associates of Huntington Beach, Calif. Related research being conducted at the Moscow-based Andreev Institute, U.S. and Russian sources said.

Despite the growing interests a capability traditionally reserved for science fiction novels and ?, industry and academic experts, are cautious and skeptical about its potential battlefield use.

"This is not something that strikes me as requiring high-? attention," Raymond Gartho? defense and intelligence analyst at the Washington-based Brookings Institution, said in a De? interview.

Morris contends that the capability has been demonstrated in the laboratory in Russia and should be placed under international restrictions at the earliest possible ?

The Development of New Antipersonnel Weapons

by Louise Doswald-Beck and Gerald C. Cauderay

17 of 27

resulting injuries is at present, and will be for the foreseeable future, virtually non-existent. The second working group, which will principally comprise psychiatrists and doctors, will study in greater detail the short and long-term effects, both for the individual and for society, of blindness & compared with other injuries typically sustained on the battlefield. The information collected can then be used for a more thorough discussion of the legal and policy implications of the development of these weapons.

5. Directed energy weapons (DEW)

Apart from the anti-personnel laser weapon, which in some respects could also be considered as a directed energy weapon, there are also very special weapons, such as those using electromagnetic waves of different wavelengths and generators of particle beams, which are considered by some experts as extremely efficient potential anti-materiel weapons. Although this particular type of weapon, which requires a considerable energy supply, is unlikely to become operational on the battlefield in the near future, the same cannot be said for weapon systems using beams of electromagnetic waves

18 of 27

or pulses. The effects induced in human beings by electromagnetic waves have been known, albeit imperfectly, for a long time and have been the subject of continuous research. Depending on the frequency used, the emission mode, the energy radiated, and the shape and duration of the pulses used, electromagnetic radiations directed against the human body may produce heat and cause serious burns or even changes in the molecular structure of the tissues they reach.

Research work in this field has been carried out in almost all industrialized countries, and especially by the great powers, with a view to using these phenomena for anti-materiel or antipersonnel purposes. Tests have demonstrated that powerful microwave pulses could be used as a weapon in order to put the adversary hors de combat or even kill him. It is possible today to generate a very powerful microwave pulse (e.g., between 150 and 3,000 megahertz), with an energy level of several hundreds of megawatts. Using specially adapted antenna systems, these generators could in principle transmit over hundreds of metres sufficient energy to cook a meal.

19-20 of 27

However, it is important to mention that the lethal or incapacitating effects which can be expected from weapon systems using this technology can be produced with much lower energy levels. Using the principle of magnetic field concentration, which permits the control of the geometry on the target, by means of antenna systems especially designed for the purpose,

the radiated energy can be concentrated on very small surfaces of the human body, for example the base of

the brain where relatively low energy can produce lethal effects. It seems that with currently available technology, serious consideration could be given to the production of such weapon systems, which could have a range of approximately 15 km and could sweep a zone with a series of fast pulses. Unprotected soldiers within this zone could be put hors de combat or killed within a few seconds. Such a weapon could be installed on a truck and would therefore be easily transportable.

In spite of the rarity of publications on this subject, and the fact tht it is usually strictly classified information, research undertaken in this field seems to have demonstrated that very small amounts of electromagnetic radiation could appreciably alter the functions of living cells. Research work has also revealed that pathological effects close to those induced by highly toxic substances could be produced by electromagnetic radiation even at very low power, especially those using a pulse shape containing a large number of different frequencies. As mentioned earlier, the energy necessary to achieve these results is often much lower than the energy required to induce a significant effect of heat in body tissues.

Some research seems to have confirmed that low-level electromagnetic fields, modulated to be similar to normal brainwaves could seriously affect brain function. Experiments with pulsed magnetic fields carried out in animals have reportedly produced specific effects such as inducing sleep and triggering anxiety or aggressiveness, depending on the modulation of the frequency used. It is, on the other hand, well known that lethal effects can also be produced by using higher power levels than those used for the experiments on behaviour modification. An anti-personnel weapon based on such biophysical principles could produce similar effects to those of a nerve gas, but would have no secondary effects and leave no lasting trace.

Biological Process Control

Looking 50 years into the future is extremely easy and, at the same time, exceedingly difficult. Easy, since I will not be around to catch the flak for being very wrong. Difficult, since it is really presumptuous to pretend that you have the vision to see the future. Nonetheless, you asked for it and here goes.

As we look forward to the future, it seems likely that this nation will be involved in multiple conflicts where our military forces increasingly will be placed in situations where the application of the full force capabilities of our military might cannot be applied. We will be involved intimately with hostile populations in situations where the application of non-lethal force will be the tactical or political preference. It appears likely that there are a number of physical agents that might actively, but largely benignly interact or interfere with biological processes in an adversary in a manner that will provide our armed forces the tools to control these adversaries without extensive loss of life or property. These physical agents could include acoustic fields, optical fields, electromagnetic fields, and combinations thereof. This paper will address only the prospect of physical regulation of biological processes using electromagnetic fields.

The literature regarding the interaction of biological processes with electromagnetic fields is growing at a rapid rate. Sources are becoming more available, biomedical instrumentation is improving so that the interactions between biological processes and physical fields can be examined with fewer artifacts, and the principles underlying these interactions are becoming clearer and more amenable to theoretical prediction.

Prior to the mid-21st century, there will be a virtual explosion of knowledge in the field of neuroscience. We will have achieved a clear understanding of how the human brain works, how it really controls the various functions of the body, and how it can be manipulated (both positively and negatively). **One can envision the development of electromagnetic energy sources, the output of which can be pulsed, shaped, and focused, that can couple with the human body in a fashion that will allow one to prevent voluntary muscular movements, control emotions (and thus actions), produce sleep, transmit suggestions, interfere with both short-term and long-term memory, produce an experience set, and delete an experience set. This will open the door for the development of some novel capabilities that can be used in armed conflict, in terrorist/hostage situation, and in training.** New weapons that offer opportunity of control of an adversary without resorting to a lethal solution or to collateral casualties can be developed around this concept. This would offer significant improvements in the capabilities of our special

operation forces. Initial experimentation should be focused on the interaction of electromagnetic energy and the neuromuscular junctions involved in voluntary muscle control. Theories need to be developed, modeled, and tested in experimental preparations. Early testing using in vitro cell cultures of neural networks could provide a focus for more definitive intact animal testing. If successful, one could envision a weapon that would render an opponenet incapable of taking any meaningful action involving any higher motor skills, (e.g. using weapons, operating tracking systems). The prospect of a weapon to accomplish this when targeted against an individual target is reasonable; the prospect of a weapon effective against a massed force would seem to be more remote. Use of such a device in an enclosed area against multiple targets (hostage situation) may be more difficult than an individual target system, but probably feasible.

It would also appear possible to create high fidelity speech in the human body, raising the possibility of covert suggestion and psychological direction. When a high power microwave pulse in the gigahertz range strikes the human body, a very small temperature perturbation occurs. This is associated with a sudden expansion of the slightly heated tissue. This expansion is fast enough to produce an acoustic wave. If a pusle stream is used, it should be possible to create an internal acoustic field in the 5-15 kilohertz range, which is audible. Thus, it may be possible to "talk" to selected adversaries in a fashion that would be most disturbing to them.

In comparison to the discussion in the paragraphs above, the concept of imprinting an experience set is highly speculative, but nonetheless, hgihly exciting. **Modern electromagnetic scattering theory raised the prosepect that ultrashort pulse scattering through the human brain can result in reflected signals that can be used to construct a reliable estimate of the degree of central nervous system arousal. The concept behind this "remote EEG" is to scatter off of action potentials or ensembles of action potentials in major central nervous system tracts.** Assuming we will understand how our skills are imprinted and recalled, it might be possible to take this concept one step further and duplicate the experience set in another individual. The prospect of providing a "been there-done that " knowledge base could provide a revolutionary change in our approach to specialized training. How this can be done or even if it can be done are significant unknowns. The impact of success would boggle the mind!

Mind Reading Machine Tells Secrets of the Brain
 Sci-Fi Comes True
 March 29th 1976
 by Norman Kempster

Washington-In a program out of science fiction, the government is developing mind-reading machines that can show, among other things, whether a person is fatigued, puzzled or daydreaming.

If the project lives up to is promise, the machines could be in use in airplane cockpits before the end of this decade to warn a pilot that his mind is wandering and he is failing to perform essential duties.

Since 1973, a little-known Pentagon agency has been studying ways to plug a computer into an individual's bran waves or electroencephalograph (EEG) signals in the scientist's lexicon.

The Advanced Research Projects Agency says the \$1 million-a-year program has passed its initial laboratory tests and is ready for determination of its military uses.

Scientist working under agency contracts at the University of Illinois, UCLA, Stanford, Massachusetts Institute of Technology and the University of Rochester and in laboratories other facilities have been able to determine an individual's alertness from his brain waves. They can tell also how he perceives colors and shapes.

But there may come a day when the EEG will be used to perform more bizarre tasks.

At UCLA, scientists are working on the use of the EEG to control machines. To give it a trivial application, a spiritualist could use the waves to make a table levitate and to give it the serious application envisioned by the Pentagon, a gun could fire by pure cerebral reflex, bypassing the body's motor system.

So far, this work has been conducted solely in the laboratory, with a subject who has electrodes attached to

his scalp thinking an object through a maze. Scientists say the maze experiment works, heightening hopes for the project.

Other applications of the EEG may come much sooner. It may be only a matter of time before the machines will be able to read a person's brain waves to determine just what he is thinking.

Within two to five years, the Advanced Research Projects Agency hope to test the EEG-computer hookups in a wide range of military uses ranging from pilot training to interpretation of satellite photos of earth.

In the airplane cockpit it could work like this:

The pilot's brain waves are read by electrodes placed in his radio earphones. A small special-purpose computer scans the peaks and valleys of the EEG to determine what the pilot is concentrating on and what he is ignoring.

If the pilot should intentionally put his plane into a dive, the computer would let it pass. But if he took a potentially hazardous action through inattention, the computer would alert him.

Scientists at the University of Illinois-the lead institution on the project-expect to test the system in Link Trainers within two years and in airplanes within five years. It then might take several years more before the system could be produced in quantity.

George H. Heilmeier, director of the research agency, dropped tantalizing hints about the EEG program in his annual report to Congress. Although he has provided few details, enough has been said about the program to raise some questions.

For example, could these systems be used to read the minds of prisoners of war or to pick the brains of unsuspecting American citizens. Highly unlikely, agency scientists say.

For one thing, the EEG must be individually calibrated. Brain-wave graphs mean different things for different persons. So it is necessary to obtain a baseline graph by having each individual think a specific series of thoughts.

"It is quick and easy to make the calibration but it must be done for each individual," one scientist explained.

Besides, under present programs, it is necessary to place electrodes on the individual's head. It does not hurt but it could scarcely be done secretly.

At MIT, however, scientists are studying magnetic brain waves that can produce graphs much like the electrical brain waves now being measured.

Scientists for the research agency say it may be possible to pick up magnetic waves a foot or two from the subject's head, perhaps by placing a receiver in the back of a chair.

Could these waves be projected over distances greater than a few feet?

"We are now talking about a foot or several feet," one scientist said. "But the research agency has a pretty good idea of what it could be doing in the 1980s.

At the University of Illinois, the research is concentrating on two possible applications--as an aid to pilots and as help for teachers.

The scientists assume that the aircraft of tomorrow will be even more automated than those of today. This means the pilot will have to make numerous decisions about the use of equipment under his command.

The research agency said the objective of the brain-wave research was to provide a system to help the pilot when he needed it and leave him alone when he did not.

Another possible application of the new technology is to give a pilot a preflight checkout. The researchers think that relatively soon they will be able to determine if anxiety or fatigue is likely to impair a flyer's effectiveness.

In the classroom, the EEG can discover how a student learns and when he is most likely to learn. It can also advise teachers about the best way to teach more to the student.

For instance, a student taking a multiple-choice test now can be graded only right or wrong. If he misses a question, the teacher can increase the emphasis on the subject so he will get it right the next time.

But scientists for the research agency believe that within two years or so a student can be given a multiple-choice test while hooked into an EEG machine. The machine can tell the difference between a 'right' answer based on knowledge and one that was merely a lucky guess. It can tell also if a student was dead certain about an answer that proved to be wrong-a result that calls for the greatest attention from the teacher to end the misunderstanding.

The research agency is interested in the way the EEG can be used to improve computer-based teaching programs. At present, the agency's researchers say, computer lesson plans can be set up only on a trial and error basis.

The agency expects an EEG hookup to show which lessons are effective and which are not.

At Stanford, scientists are studying EEG charts to determine the part of the brain that is in use when persons are most successful in remembering pictures or graphs.

In theory, everyone has "photographic memory" some of the time. If it can be determined when a person is most likely to remember the details of a picture, it should help in interpretation of photo reconnaissance.

Interpretation of satellite photos involves the quick recognition of changes in a pattern from one day to the next. Scientists for the research agency say that, if the Stanford project is successful, technicians can be shown the photos only when their brains are most receptive.

At the nearby Stanford Research Institute, a private firm previously associated with the university, scientists are testing a theory that the brain's two hemispheres perform separate functions.

The work of an air traffic controller, for instance, may be governed entirely by one of the brain's hemispheres. By attaching several controllers to EEG machines, it is possible to direct the work to the controller whose brain is most ready to handle it at any particular time.

Mind-Altering Microwaves
Soviets Studying Invisible Ray
November 22, 1976

A newly declassified U.S. Defense Intelligence Agency report says extensive Soviet research into microwaves might lead to methods of causing disoriented human behavior, nerve disorders or even heart attacks. "Soviet scientists are fully aware of the biological effects of the low-level microwave radiation which might have offensive weapons application," say the report, based on an analysis of experiments conducted in the Soviet Union and Eastern Europe.

According to the study, this research work suggests the potential for the development of a number of antipersonnel applications."

Microwave beams are the electronic basis of radar and are widely used for relaying long distance telephone calls. Other common sources of microwaves include television transmitters.

A copy of the study was provided by the agency to the Associated Press in response to a request under the Freedom of Information Act. The Pentagon agency refused to release some portions of the study, saying they remain classified on national security grounds.

The report made no direct mention of the Soviet microwave bombardment of the U.S. Embassy in Moscow where despite strong American protests the radiation continues, though at reduced levels.

Up to now, the view most widely accepted among State Department officials in Washington has been that the Soviets appear to be using the microwave beams to foil sophisticated U.S. electronic intelligence gathering equipment at the embassy.

The State Department issued an administrative source on Nov. 12 declaring Moscow "an unhealthy post," but no link was officially drawn between this move and the radiation situation. Department spokesmen insist that medical tests have found no adverse health effects attributable to the microwaves.

The Soviets have denied beaming any radiation at the embassy, contending that the microwaves are simply part of the normal background radiation found in any major city.

The Pentagon agency's report, distributed within the government last March said that biological effects which could alter anti-personnel uses is the phenomenon known as **microwave hearing**.

"Sounds and possibly even words which appear to be originating intracranially (within the head) can be induced by signal modulation at very low average power densities," the study said. It added that "combinations of frequencies and other signal characteristics to produce other neurological effects may be feasible in several years."

The report concluded that Soviet research in this area has great potential for development into a system for disorienting or disrupting the behavior patterns of military or diplomatic personnel. It could be used equally as well as an interrogation tool.

...Soviets have also studied various changes in body chemistry and functioning of the brain resulting from exposure to microwaves and other frequencies of electromagnetic radiation.

One physiological effect which has been demonstrated is heart seizure. It said that this has been accomplished experimentally in frogs by synchronizing the pulses of a microwave signal with the animals heart beat and beaming the radiation at the chest area.

The document added that a frequency probably could be found which would provide sufficient penetration of the chest wall of humans to accomplish the same effect-heart attacks.

The report said that another potential antipersonnel use. ...microwaves could be used to effect the blood-brain barrier, which regulates the exchange of vital substances between brain cells and the circulatory system.

More Evidence of human radiation...

by Les Blumenthal

A presidential commission says it has, at least, circumstantial evidence the CIA engaged in Cold War human radiation experiments, but the agency steadfastly denies it had any involvement.

The experiments represent one of the darkest sides of the Cold War, and the secrets have been, and continue to be, closely held behind the veil of national security.

The committee, appointed by President Clinton earlier this year to report on the experiments and make possible recommendations on the thorny issue of compensation, asked half a dozen or so government agencies to review millions of documents dating back to the 1940s.

In addition to the CIA, the Department of Defense, the Department of Energy, as keeper of Atomic Energy Commission documents, the Department of Health and Human Services, the Department of Veterans Affairs and the National Aeronautics and Space Administration all searched their files. A sketchy picture of their involvement in the experiments has begun to emerge.

The committee, in a report marking the halfway point of its year-long effort, said it has discovered human radiation experiments may have been far more widespread than originally thought.

A 1986 congressional study, considered the most exhaustive review to date, found evidence of dozens of experiments, and according to estimates earlier this year, about 1,000 people or so were involved.

The committee, however, has found firm evidence of about 400 experiments and fragmentary evidence of an

additional 100. Up to 23,000 people may have been involved.

In addition, the committee has evidence intentional radiation releases may have numbered in the hundreds rather than the 13 previously thought. Whether there were more releases at the Hanford Nuclear Reservation in Washington state than jut the infamous Green Run of 1949 remains unclear. The committee has asked the departments for more information on Hanford as it prepares for a Nov.21 meeting in Spokane.

Classified information

Much of the information on the intentional releases remains classified, and the committee remains uncertain whether there will be public access to it. Even though the releases are thought to date back 30,40 or 50 years, the departments cite national security in denying information to the committee.

The CIA, with its black budget and cloak-and-dagger image, was assumed to have been deeply involved in the radiation experiments.

The agency, however, said no.

"To date, CIA has found no records or other information indicating that it conducted or sponsored human radiation experiments," the committee said in its interim report.

...The committee, however, said is has evidence CIA officers took part in Pentagon groups in which human radiation experiments were discussed and planned.

During the 1950s, the CIA conducted an "extensive" human experimentation program to find ways to control behavior using drugs, psychological methods and other means.

...But some of the documents unearthed by the advisory committee hint at more sinister projects.

A 1963 CIA Inspector General report said MKULTRA was "concerned with research and development of chemical, biological and radiological materials capable of employment in clandestine operations...

Research Possibilities

Reliable Newspaper and Magazine Sources Document Proof of Mind Control Technology

[Mind Justice Home Page](#)

A major problem for the victims of government experimentation is **how to overcome the national security act and it's suppression of key evidence for lawsuits, congressional hearings and international human rights complaints.** Mind control technology is world-wide and classified as this example illustrates. In *Born Secret The H-Bomb, the Progressive Case and National Security*, by A. DeVolpi et al, Pergamon Press, 1981, page 138-9; "...foreign policy and related activities allow a wide expanse for classification, including the subject matter of treaties to which the United States might become bound.... The pervasiveness of secrecy in foreign affairs is amazing. A taxonomy by Frank and Weisband of principal foreign affairs secrets contains the following categories: ...treaties, agreements; ...secret diplomatic negotiations; ...executive process (...expert advisory briefs, reports from diplomats); ...tariff or import agreements;... **With this umbrella of secrecy, it is not surprising that official American overseas involvement can be hidden from public scrutiny.**"

FOIA or Freedom of Information Act requests and contacting the reporters and/or scientists listed in the following articles would strengthen the mind control cases. Research and share information to create a strong mind control database. More articles upon request. Contact: [click to e-mail](#)

Introduction

Mind Control is no longer science fiction. The Learning Channel science program called "Future Fantastic, I, Robot", Dec 17th 1997 featured Han Morovec. He is a well established scientist who studies robotics and reported that within the near future, it will be possible to put a person's personality into a computer and a computer personality into a person. The program also stated that the U.S. government has a highly classified cyborg program, a program to replace human functions with machine and computer parts.

And on the Discovery channel on December 29th 1997 a program entitled "Non lethal weapons Shoot Not to Kill", electromagnetic weapons were demonstrated that can paralyze and disorient a terrorist, or be used against a crowd or in a siege. Since the 1960s, there have been allegations that the U.S. and other governments have been experimenting on people without their consent in a highly classified weapon testing program to control the mind using electromagnetic technology. These weapons work on the hypothesis that electromagnetic signals from outside sources can mimic the mind and body's electromagnetic signals. Proof in support of the allegations are growing.

Most scientists have agreed that mind control is theoretically possible in this lifetime and many sign national security oaths which prevent them from discussing their research in this area. But they will discuss the logical implications of the research into mind control. Here is one of many articles about mind control from the New York Times Magazine, November 15, 1970, "Brain Researcher Jose Delgado Asks-'What Kind of Humans Would We Like To Construct?' Delgado said;

"The human race is at an evolutionary turning point. We're very close to having the power to construct our own mental functions, through a knowledge of genetics (which I think will be complete within the next 25 years); and through a knowledge of the cerebral mechanisms which underlie our behavior."

In the same article Dr. Morton Reiser, chairman of the Yale department of psychiatry stated;

there are 'probably some frightening potentials' in Delgado's work. "If you can use computer technology to send an unmanned space satellite to the moon, then it doesn't seem utterly impossible that one day our computers will be sophisticated enough to be used to put thoughts into people's heads. ...Suppose, for instance, there was someone with uncontrollable rage reactions which were due to something detectable in the nervous system. The computer could send back a stimulus to inhibit that response. I don't think that's science fiction..."

There is ample evidence that the U.S. government has funded behavior control research for intelligence purposes. This related quote is from *Journey Into Madness, The True Story of Secret CIA Mind Control and Medical Abuse* by Gordon Thomas, Bantam Books, 1989. Mr. Thomas is a former producer for the BBC, a veteran foreign correspondent and investigative journalist who has reported from many hot spots around the world.

"Dr. Gottlieb and behaviorists of ORD [Office of Research and Development, CIA, Central Intelligence Agency] shared [Dr.] Jose Delgado's views that the day must come when the technique would be perfected for making not only animals but humans respond to electrically transmitted signals" ... "Like Dr. Delgado [Yale University], the neurosurgeon (Dr. Heath of Tulane University) concluded that ESB [electronic stimulation of the brain] could control memory, impulses, feelings and could evoke hallucinations as well as fear and pleasure. It could literally manipulate the human will-at will."

And the actions of government officials from the 1940s to the present support a classified history of military mind control research. From *The Mind Manipulators*, by Alan Schefflin, 1978 p. 214.

In 1964, Richard Helms, the CIA's Deputy Director for Plans, responded to a question from J. Lee Rankin, the General Counsel for the President's Commission on the Assassination of President Kennedy, about Soviet brainwashing techniques. Mr. Helms suggested that the Soviets were locked in a "battle for the minds of men." Helms was echoing Allen Dulles, who, as the newly installed Director of the CIA, had addressed a national meeting of Princeton alumni on April 10, 1953, at Hot Springs, Virginia, as follows. In the past few years we have become accustomed to hearing much about the battle for men's minds-the war of ideologies - and indeed our Government has been driven by the international tension we call the 'cold war' to take positive steps to recognize psychological warfare and to play an active role in it. I wonder, however, whether we clearly perceive the magnitude of the problem, whether we realize how sinister the battle for men's minds has become in Soviet hands. We might call it, in its new form, "brain warfare. The Helms memorandum was classified in 1974 and is Warren Commission document no. 1131. The Dulles speech was excerpted in U.S. News and World Report (May 8, 1953), p. 54, under the title "Brain Warfare-Russia's Secret Weapon."

The problem of mind control is complicated and covers a long time period. There are historical reasons in support of victim's allegations. A pervasive cold war mentality has been rampant for 50 years and is inhuman and unnecessary. This attitude also created an as yet unreported electromagnetic weapon testing program on U.S. citizens. Writing about radiation experimentation, David C. Morrison reported in the *National Journal* 11/26/94 p. 2806 "Unalterably launched into a post-postwar era, we still struggle in a thousand ways great and small with the aftermath of the cold War's murderous rivalry. Among those consequences, obviously, is the total-war mentality that spawned the use of unsuspecting human guinea pigs."

In the same article, Army Air Forces General Curtis E. LeMay who directed the killing of 900,000-some people in the terror bombing of Japan stated "There are no innocent civilians..., so it doesn't bother me so much to be killing innocent bystanders".

The many related facts that the government bureaucracy does not want the U.S. public to put together form an undeniable proof of mind control. While mind control may not be the in the form of mainstream publications, it is irrefutable and inevitably will be common public knowledge, just as the radiation problem is today.

The Problem: a Classified Arms Race Between the Super Powers to Control the Human Mind and Body with Electromagnetic Technologies

The big picture is that there is a classified arms race between the super powers to develop and control human behavior using electromagnetic and neurological technologies. International treaty discussions on electromagnetic weapons have been reported in the Bulletin of Atomic Scientists, Sept/Oct 1994 p.44, subsection "Non-lethal" weapons may violate treaties" by Barbara Hatch Rosenberg, director of the Chemical and Biological Weapons Program of the Federation of American Scientists. On electromagnetic weapons she writes: "These weapons are said to cause temporary or permanent blindness, interference with mental processes, modification of behavior and emotional response, seizures, severe pain, dizziness, nausea and diarrhea, or disruption of internal organ functions in various other ways. ...In addition, under the Certain Conventional Weapons Convention, international discussions are now underway that may lead to the development of specific new protocols covering electromagnetic weapons. ...The current surge of interest in electromagnetic technologies makes the adoption of a protocol explicitly outlawing the use of these dehumanizing weapons an urgent matter.

There is much proof of the major world power, the U.S. and it's development of this technology. Just one example is from the Atlantic Monthly, The Zap Gap, March 1987 by Chuck de Caro, p. 28;

There have been many far-out hypothetical armaments in the news since Star Wars went from being a movie to being a weapons system, so it is perhaps understandable that when Defense Secretary Caspar Weinberger made a clipped reference in a 1983 speech to "radio-frequency weapons," reaction was minimal. The last thing most congressmen and commentators want is another sheaf of physics equations to sift through. Yet radio-frequency (RF) weapons, which are rarely mentioned in the general press, appear closest to realization than the energy beams and supermissiles of Star Wars."

There are over 25 articles from the 1970s to the 1990s on Russia, once a super power and it's development of this technology. See Articles on Russian Mind Control and Electromagnetic Technologies, 1997 Fort Bragg, CA, Flatland Books. Walter Bowart's Operation Mind Control 1978, discussed Vietnam veteran accounts of the use of mind control technology. David Guyatt wrote an article on Feb. 1996 for the International Committee of the Red Cross Symposium. The Symposium was entitled The Medical Profession and the Effects of Weapons. Guyatt reported in 1989 that a Department of Defense medical engineer "sourced a story claiming that the context of conditioning, microwaves and other modalities had regularly been used against the Palestinians.

The new weapons are revolutionary and affect every citizen's future. The New York Times, Dec. 29, 1965 p 28 covered the speakers at an American Association for the Advancement of Science meeting. It was entitled "Controlling the Mind". Prof. David Krech of the University of California suggested that probable future capabilities for controlling human minds contain more serious implications than even the successes of the nuclear physicists." ...time must not be wasted if these new capabilities are to be harnessed for the benefit of free societies rather than perverted to destroy them and enslave their citizens." Public input and discussion of the development of these new weapons and their use should belatedly begin.

Two points are critical to remember. One, the government is torturing U.S. citizens with this technology and two, the U.S. public has the right to have a say in the use and development of this technology. This is a massive human rights violation actively covered up by the U.S government. For the last 50 years, electromagnetic and neurological weapon testing programs have been classified under the national security act according to government policy. So it is imperative that the U.S. public demand that it be declassified. In the meantime, the U.S. public can review the factual and documented information on this government policy and decide for themselves.

[Contents](#)

Supporting Documentation in Spite of the National Security Act

Here is just one example of how victims cannot get around the national security act. In a letter from the National Security Agency, March 19, 1997 to Cheryl Welsh;

"On 21 October 1996 the DIA [Defense Intelligence Agency] referred one responsive NSA-originated document relating to a Soviet mind control system to this Agency for our review and direct response to you. ...The information is classified because its disclosure could reasonably be expected to cause exceptionally grave damage to the national security."

And here is an example of why victims cannot get this human rights issue into mainstream publications. This

is an article from the Washington Post, April 27th, May 3, 1992 Weekend Edition, p 34 "Playing I Spy With That Alleged New Openness at the CIA" by George Lardner Jr.

The task forced, headed by then-CIA public affairs director Joseph DeTrani, also touted what it saw as the accomplishments of the agency's existing media program. ..."PAO {the public affairs office} now has relationships with reporters from every major wire service, newspaper, news weekly and television network in the nation." the report said. "This has helped us turn some 'intelligence failure' stories into 'intelligence success' stories, and it has contributed to the accuracy of countless others. "In many instances," the report continued, "we have persuaded reporters to postpone change, hold or even scrap stories that could have adversely affected national security interests or jeopardized sources and methods."

The balance of national security and individual rights and freedoms is severely skewed in favor of government abuse, (see CAHRA [now Mind Justice] website under Ex-Con, subheading national security). An important remedy would be to release classified documents for court cases. And the legal standard of proof for allegations of illegal experimentation and illegal operational intelligence programs should take into account the 50 year government cover up of electromagnetic technology and its health effects, (see CAHRA [now Mind Justice] website Timeline under Louis Slesin).

There is significant Russian research on electromagnetic health effects. See Paul Brodeur's Zapping of America, 1977. This book also covers the politics involved in electromagnetic weapon programs. One of many articles that never reached the front pages of mainstream press include the article in the March-April 1988 21st Century, p. 50 entitled "Bioelectromagnetics How Radiofrequency Waves Interact with Living Systems, By James W. Frazer PhD and Joyce E Frazer. The subtitle is "The nonthermal effects of electromagnetic radiation on living cells offer clues as to what is life, as well as to understanding Soviet research on the possibility of controlling human thought and emotional experience."

Here is another example of Russian research. Declassified DIA document.

MEMORANDUM FOR THE RECORD SUBJECT: Briefing of NSC [National Security Council] Ad Hoc Committee on NIEMR [nonionizing electromagnetic radiation] bio-effects...1. On Wednesday, 26 February 1975, I briefed an ad hoc committee convened by [blank] of the National Security Council for the purpose of studying implications of Soviet research of the biological effects of non-ionizing electromagnetic radiation. My briefing consisted of a discussion of recent intelligence reports and Soviet and Host European research on the subject. 2. I was assisted in the briefing by [blank] the Navy Medical Research Institute and [blank] the Office of Telecommunication Policy. Executive Offices of the President. ...

The Soviets have explored electromagnetic technology for military uses since at least the 1950s. From The Zapping of America by Paul Brodeur, 1977, ISBN 0 393 06427 1. On page 301, there was a quote from Dr. Milton Zaret, who worked on the 1965 CIA Project Pandora, a program to determine the purpose of the microwaves bombarding the Soviet Embassy by the Russians which started in 1962. Jack Anderson broke the story. Dr. Zaret stated, "When I analyzed the Soviet literature for Project Pandora, back in the 60s, it was very clear that such an encoding impressed onto a carrier wave lengths could have a CNS [central nervous system] effect.

In the Agent Orange class action court case, the years long legal battle did not serve justice. The chemical manufacturers had the advantage of money while the legal proof of damage from Agent Orange required by law to win the court case was extremely difficult to obtain. See GI Guinea Pigs How the Pentagon Exposed Our troops to Dangers More Deadly Than War: Agent Orange and Atomic Radiation by Michael Uhl and Tod Ensign, 1980. The current electromagnetic weapon testing program has the same imbalance of justice as the Agent Orange case. Many more examples can be given. The solution is there, but it has been impossible for victims to get the problem into mainstream media so that the public is aware of the problem and will no doubt be appalled and ready to act.

Experts and professionals and several independent articles and sources clearly support that government mind control is real but has been completely out of public awareness. There are news programs and series, conferences, military documents, books, government reports and international treaty discussions about electromagnetic technologies. One of the best articles is "The Development of New Anti-personnel Weapons" by Louis Doswald-Beck, Nov 1, 1990 in the International Review of the Red Cross. It states that "In spite of the rarity of publications on this subject and the fact that it is usually strictly classified information ...very small amounts of electromagnetic radiation could appreciably alter the function of living cells." It further states that "Research work in this field has been carried out in almost all industrialized countries, and especially by great powers, with a view to using these phenomena for anti-materiel or antipersonnel

purposes."

U.S. News and World Report July 7, 1997 discusses behavior altering electromagnetic weapons in a front page article. Defense News 1993 discusses Russia's mind control weapons in great detail, specifically electromagnetic signals beamed into soldier's brains. The United States Air Force Scientific Advisory Board 1996, New World Vistas describes future uses of electromagnetic technology and creating the mental illness phenomena of hearing voices with microwaves for use on terrorists.

Many scientists have lost government funding for speaking out about electromagnetic health effects, (refer to CAHRA [now Mind Justice] website under Timeline.) This type of censoring of information has prevented a balanced picture of electromagnetic health effects and a court case would reflect this bias.

The Military Use of Electromagnetic and Neurological Technology

Here are examples of government's development of this technology. From the Future Agenda Congressional Clearinghouse on the Future, Chairman Albert Gore Jr., 1982, p 35;

Trends in weaponry. Although not an immediate issue, there is some speculation that the distant future may bring totally new weapons of broad-scale destruction. These kinds of weapons might include climatological weapons, new electronic devices such as high-energy directed beams and mind-control mechanisms. Whether or not these weapons could or should be developed, and the means of defense against them in the event of enemy deployment, may be subject to debate in the coming years.

Books include Mind Wars 1984 by Ron McRae, associate of reporter Jack Anderson. McRae wrote on page 62;

"In 1977, Samuel Koslov, assistant secretary of the navy for research and development, learned the navy had a contract with Stanford Research Institute to study ELF [extremely low frequency] and mind control. ...Currently research into the effects of Elf on the human brain are well-funded and highly classified."

The cable TV program "Weapons of War" on the Learning Channel on September 21, 1997 featured Dr. Michael Persinger of Laurentian University, Canada. He described weapons using "psycho or influence technology" and electromagnetic frequencies to control what people think, for psychological warfare purposes.

Conferences include "Federal Regulation of Medical Devices for the Nineties", Nov 5, 1994. Keynote Speaker, Dr. John H. Gibbons, took the oath of office as Assistant to the President for Science and Technology and Director Office of Science and Technology Policy White House Science Advisor on Feb. 2, 1993. Remote monitoring and surgery or "telepresence" surgery for battlefields were discussed. Recent advances in high rate information sensing, processing and transmission from the remote battlefield setting were illustrated.

Military documents include "Low Intensity Conflict and Modern Technology " by Lt. Col Dean, June 1986. Capt. Paul Tyler wrote this section;

"Potential Military Applications of EMR. The potential applications of artificial electromagnetic fields are wide ranging and can be used in many military or quasi-military situations. Some of these potential uses include dealing with terrorist groups, crowd control, controlling breeches of security at military installations and antipersonnel techniques in tactical warfare. In all of these cases the EM systems would be

used to produce mild to severe physiological disruption or perceptual distortion or disorientation."

[Contents](#)

Examples of the Operational Use of Electromagnetic and Neurological Weapons

Examples of government abuse of this technology already exist. There is a long unpublicized history of emf and neurological research. And here is one of the practical applications of that research. The women protesters at their peace camp at Greenham Commons military base in England were targeted with radiation

and antipersonnel weapons in 1985 as reported in The Nation, vol. 244, March 14, 1987.p 313. They were protesting against cruise missiles at the U.S. Air Force base in southern England. Their reported symptoms matched "microwave sickness." Dr. Rosalie Berrell, Kim Besley, a former radar engineer and members of Electronics For Peace, all took measurements at Greenham and there were strong electromagnetic radiation levels, up to 100 times higher than adjacent areas. This was reported in the publication, Peace and Freedom, Jan./Feb 1989 p 24.

In the publication Science for the People, an article dated Sept/Oct 1987 p 23 reported the following. The City Limits newspaper claimed that the British Ministry of Defense was probably using its new intruder detection system CLASSIC (Covert Local Area Sensory System for Intruder Classification) at Greenham. The newspaper The Manchester Guardian wrote that "The U.S. employs an intruder detection system called BISS (Base Installation Security System) which operates... 'on a sufficiently high frequency to bounce radar waves off the body moving in the vicinity of a perimeter fence.' In 1972, the U.S. Army Equipment and Research Center published a study entitled Analysis of Microwaves for Barrier Warfare. Many other similar sources of information were listed.

As reported in Connexions 29 1989 p 3, in 1985, women at Seneca Womens' Peace Encampment in New York started to suffer from similar symptoms. And after filing an injunction at Newbury Count Court in Jan 1988, the women named as plaintiffs have had their homes and cars broken into, papers stolen and mail opened but the zapping stopped. Peace and Freedom reported use of EMR weapons at Molesworth (USAFE), at the Peace Farm (Pantex bomb factory, Texas) and in Central American and elsewhere. The well-established Women's International League for Peace and Freedom went as far as to form the Ad Hoc Committee on EMR Weapons in New York.

Here is a second example. From Electromagnetism and Life, Dr. R.O. Becker, p 227. "The possibility that the Soviet Union might be ahead of the USA in EM weapons systems has persisted at least since the discovery of the irradiation of the U.S. Moscow embassy in 1953." And in the Washington Times, Nov. 15, 1972, "The Russian Government is continuing to bombard the U.S. Embassy in Moscow with microwave radiation, according to U.S. officials." The pulsed "emanations originate from a residential building across the street that is believed to be staffed by Russian security officials." In 1976, the Globe reported that Ambassador Walter Stoessel "developed a rare blood disease similar to leukemia and was suffering headaches and bleeding from the eyes. Two of his irradiated predecessors, Ambassador Charles Bohlen and Ambassador Llewellyn Thompson, died of cancers." These are many more examples of the use of this technology by the superpowers.

[Contents](#)

Political Uses of Electromagnetic Intelligence Tools and Cia Operations

There are innumerable cases of the political uses of this technology. Of course, the evidence is not irrefutable since necessary documents are classified. But there is enough evidence to call for an investigation. At the September 21, 1977 Senate hearing on MKULTRA, the CIA's Program of Research in Behavioral Modification, Dr. Gottlieb, who had been director of the CIA's mind control experiments, warned congress of Russia's current use of intelligence weapons against the U.S. government. He stated that President Nixon was most likely targeted by the Russians in an attempt to influence U.S. officials. with some type of intelligence tool. On a 1972 trip to Russia, President Nixon and his staff had reported 'inappropriate behavior' including crying without provocation. In the same senate hearing, Gottlieb reported that the CIA was interested in how radiofrequency waves would affect behavior. James Mills, a UPI news reporter and the author of The Power, the fictional account of mind control, researched his book by going to Russian scientific institutions. On the TV interview Paranormal Warfare- a Secret Military Power? with Larry King Live on Sept. 12, 1990 transcript #127, Mills stated that many people believed that electromagnetic weapons were used on President Nixon in the incident reported by Dr. Gottlieb.

Here is another example. Major newspapers such as the Feb. 14, 1992 USA Today, have reported allegations by Saddam Hussein that the CIA targeted him with mind control and "the CIA used psychotronics and biocommunication to cause a blood clot in the brain or heart...". Heart attacks, suicides, assassinations, blackmail, all can be done remotely leaving no trace of evidence to tie it to the perpetrator.

The San Francisco Chronicle, Sept. 30, 1996 article entitled "Natural Law Party Nearly Unknown, But on the Ballot, Libertarian ideals, science, transcendental meditation" discussed "...seeking to bring the 'light of science' into politics through means that by any description are unconventional - including 'mapping'

politicians' brains to catalog intelligence, creativity and stability in a crisis." This statement was made by Natural Law Party vice president candidate Mike Tompkins, who was "schooled at Andover and Harvard and worked as a consultant in 'human development' in the fields of health care, education and corrections." This rumor needs further investigation and is an example of the many leads, false or otherwise that are available.

Here is an example of Russia's political use of mind control technology. July 16, 1981, David Brinkley News Program No. 47592, David Brinkley stated, "it is known the Russians are working hard on controlling the human mind by remote electronic means." On the same show he interviewed Dr. William Van Bise, a radio engineer who investigated the Russian Woodpecker radio signal broadcast across the United States in the 1970s. Dr. Van Bise had evidence that the Russian radio signal was "at a frequency that the human body sort of operates at-10 Hertz is right in the range of biologic frequencies.". In reply to a question Bise stated that the easiest way to disrupt the mental process would be with microwaves.

The U.S. public needs to know that many seemingly unconnected facts are adding up to a government cover up. Hi tech intelligence tools and weapons are operational today without public awareness and accountability and have been for many years.

Advanced Electromagnetic Intelligence Tools-yet Another Classified Intelligence Program after Cointelpro

Victims such as Delores Hejazi and investigative reporter Alex Constantine are reporting Cointelpro tactics when complaining or disagreeing with agencies such as the CIA and the IRS. Hejazi wrote a letter of complaint to the IRS and her problems began. She was systematically discredited and became suicidal and eventually refused treatment for her throat cancer. She died recently and was unable to get an investigation of her claim as reported in the 6-28-91 Cleveland Plains Dealer newspaper "of being repeatedly attacked and tortured by government agencies, beam weaponry and laser technology."

Alex Constantine, a Los Angeles reporter, investigated the McMartin child abuse case and was subsequently targeted with electromagnetic intelligence tools. In spite of the discrediting and disrupting techniques that he has endured to this day, Constantine's reporting now includes two books on the topic of government mind control.

As described in Encyclopedia Britannica, Cointelpro was an FBI counterintelligence program in the 1960s designed to disrupt groups and neutralize individuals deemed to be threats to domestic security using intelligence-gathering techniques of surveillance, discrediting the target and harassment. It was used extensively on Martin Luther King. Today intelligence agencies are using hi tech electromagnetic tools to accomplish the same illegal goals.

It is well documented in congressional reports that the FBI targeted anti-Vietnam groups and labor groups in the 1970s. The House Judiciary Committee, Subcommittee on Civil and Constitutional Rights, Hearings Nov. 1975 pp 9,44 reported on the FBI "Counterintelligence Program". While there were examples of egregious improper conduct, the overwhelming bulk of the FBI programs were clearly legitimate. Twelve legal objectives were listed, including use of informants to disrupt a group's activities and establishing sham organizations for disruptive purposes. Illegal FBI activities listed in this report included investigating the love life of a group leader for dissemination to the press. As reported in The Berkeley Barb newspaper on Jan. 11-17, 1974, The National Caucus of Labor Committees reported a CIA and Soviet Psycho-Sexual Brainwashing Plot to infiltrate their organization. The claim sounded so bizarre that it was dismissed as "crazy". This is another of a countless number of claims which were never seriously investigated.

Today, the Militia is alleging government harassment. Several newspaper articles are reporting this claim. "Government Wants Me Dead" reported the Associated Press, 5-14-95. Court records show that Indiana national militia leader and attorney Linda Thompson "told a deputy at the Marion County Prosecutor's Office that the government was trying to kill her with radio frequency weapons." This is plausible in light of the Discovery channel TV program, Sci Trek, Shoot Not to Kill, Nonlethal Weapons which aired on Dec. 29, 1997. Electromagnetic weapons were used to cause abdominal pain to stop a protester and acoustic sound waves disoriented a group of demonstrators. Many police departments around the country have nonlethal weapons. According to the July 7, 1997 U.S. News and World Report article on electromagnetic weapons, "And for a good 40 years the U.S. military has quietly been pursuing weapons of this sort. Much of this work is still secret..."

Time magazine June 26, 1995 reported on Mark Koerneke, of the Michigan Militia who believes that there are "Americans enslaved and implanted with microchips." This is a plausible claim as the government funded behavioral control research in the 1970s which included implanting electrodes to control violence by a Harvard Medical School professor and others.

There is much more plausible evidence of governmental implants and microchips. In the Southern California Law Review, Feb. 1974 Vol. 47 no.2, Michael Shapiro wrote the article Legislating the Control of Behavior Control. On page 239 he quotes P. London, Behavior Control 4-5 1969;

Means are being found in all the crafts and sciences of man, society, and life, that will soon make possible precise control over much of people's individual actions, thoughts, emotions, moods, and wills...

...Electronic miniaturization and improvements in surgery increasingly exploit discoveries of the exact locations in the brain where various behavioral functions are managed:

...radio remote controls over epileptic seizures, sexual desire, and speech patterns are already operational.

The U.S. public should have the facts so that they can decide. Unfortunately, the U.S. government is not going to talk about their illegal behavior or classified research. The U.S. public should be aware of the numerous claims that the U.S. government have used and continue to use electromagnetic weapons to control the so-called subversive and anti-government elements of society. Unfortunately the CIA and other government institutions have not been responsive to claims of abuse. Government officials should not be above the law and have different rules which allow illegal acts to go unreported as a result of classified work under the national security law.

[Contents](#)

Whistleblowers Silenced with Electromagnetic Harassment Technologies and Tools

The April 10, 1988 San Francisco Chronicle reported Secret Agent for the Feds Now Lives in Fear of Them. Rex Niles was an FBI whistleblower and his "unprecedented cooperation" led to the conviction of 19 industry buyers and supervisors on fraud, tax evasion and kickback charges. Government officials estimate that Niles had handed over millions in under-the-table payments of leading electronics contractors. He participated in the Federal Witness Protection Program and now he is suing the government. He reported "an assault of microwaves and x-rays" and had documented proof of high levels of radiation. He was harassed in many ways, including lack of sleep and he described a noise campaign which included "aggravating his conscious as well as my subconscious mind."

Here are the facts. Knowledge of electromagnetic technology is available in unclassified as well as highly classified sources. Just one example is as follows. On the 1986 Special Report CNN news program, Chuck DeCaro asked the Pentagon repeatedly about microwave weapons and after months of waiting, the Pentagon replied, "Radiofrequency weapons are too sensitive to discuss." There is a documented and recent congressional reports of illegal domestic surveillance and harassment of so called anti-government types of people by intelligence agencies such as the NSA, the FBI and the CIA.

Additionally, government lying and cover up is commonplace, for example in the Iran-Contra case and the Gulf War Syndrome. The book Whistleblowers, Exposing Corruption In Government and Industry by Myron Peretz Glazer and Penina Migdal Glazer, 1989 documented a history of the loss of jobs and harassment of whistleblowers. One famous whistleblower, Karen Silkwood was killed in a mysterious car crash while on her way to a news reporter and important documents of radiation worker's unsafe conditions were somehow lost. Rex Niles was a competent and successful businessman and he has physical proof of high radiofrequency levels. Yet he was considered mentally ill and his claim was not investigated.

A 40 year old professional woman who reported investor fraud to the FBI in 1986 was subsequently targeted. She is an environmental, health and safety engineer and is now targeted with surveillance, documented high levels of radiation, mercury poisoning, stolen work records and more. She believes that she is being systematically discredited and harassed in order to stop her whistleblowing activities.

Here is another tragic example. A nurse filed a workmen's compensation claim in 1996 because of a diagnosed allergy to latex gloves. Electronic harassment began a few months later. This nurse reported a cluster of symptoms that matched known intelligence harassment techniques. She reported harassment such as numerous break-ins of her car and apartment with objects rearranged, phone tampering,

inexplicable electrical equipment problems, noise campaigns which disrupted her sleep and discrediting techniques of physical electromagnetic harassment. If she naturally discussed her symptoms, it was designed to sound paranoid and "crazy". Physical evidence was disregarded and her complaint was ignored as that of a sick person. The increasing numbers of cases need to be investigated in depth and not superficially dismissed.

[Contents](#)

Reports of Prison Experimentation

Since the 1960s, U.S. prisoners have reported physical and psychological torture with remote electromagnetic technologies. John Ginter and many other prisoners describe a strikingly similar cluster of torture techniques that matches the development and description of electromagnetic technology.

Behavioral control experiments on prisoners has a long history. For example, in the 1974 Congressional hearing entitled Individual Rights and the Federal Role in Behavior Modification, abuses at California's Vacaville prison in the early 1970s included psychosurgery and behavior control drug experimentation using a paralyzing drug called anectine. Anectine causes a prolonged seizure of the respiratory system that some have described as "worse than dying." Researchers stated that they had tested it in an aversive treatment program as "a means of suppressing hazardous behavior {e.g., repeated assaults, attempted suicide.}" In the 1974 Southern California Law Review Vol. 47:247 in an article entitled Legislating the Control of Behavior Control, Michael H. Shapiro commented about the illegal Vacaville prison experiments;

"Such gross assaults upon personal autonomy should dispatch any notions that officialdom in general or the medical profession in particular can safely be left to their own devices in determining the nation and occasions for intervention in human mentation for purposes of achieving mind/behavior control."

Dr. L.J. West, director of the UCLA Neuropsychiatric Institute proposed a new Center for the Study of Violent Behavior which would have used prisoners at Vacaville and other sites. It was heavily supported by Governor Reagan. The 4-1-73 San Francisco Chronicle article stated "Although the description does not say brain surgery will necessarily be carried out, West says it's one means possible to control violent behavior. ...The most potentially controversial project is called "Violence Prediction and Brain Waves."

In a Los Angeles Times article dated 4-16-73, West denied that psychosurgery would be performed at the Center. But leaked copies of the proposals stated otherwise. The Center was not approved, in part a result of heavy public opposition.

Dr. West also has a long history of behavior control research. A government memorandum entitled "Interrogation Techniques," dated 1-14-53 stated, "If the services of Major Louis J. West, USAF (MC), a trained hypnotist, can be obtained and another man well grounded in conventional psychological interrogation ...a well-balanced interrogation research center could be established ..." According to the New York Times, Dr. West worked on LSD experiments financed by the CIA.

Dr. West is still at UCLA and is listed as a contributor to the 1996 USAF Scientific Advisory Board's "New World Vistas" report. He is believed to be the anonymous author of a paper in this report entitled "Biological Process Control". This paper describes the future use of electromagnetic technology on the human system that "would render an opponent incapable of taking any meaningful action involving any higher motor skills, (e.g. using weapons, operating tracking systems)."

It is a fact that nobody likes to admit but torture is an ancient and well established institution of socialized human behavior. As reported in New York Times Magazine, Dec. 28, 1997 in the article To Hell and Back "The primary purpose of torture is not to elicit information--it produces lies more often than truths--but to break the victim's personality. In this torture is wildly successful." Whether torture is now high-tech and occurs in prisons or to whistleblowers or to control "dissidents" it is still just another form of the act of torture and is a part of human nature always to be watchful for and prevented.

[Contents](#)

Nonconsensual Classified Government Experimentation

Cheryl Welsh, a government major at California State University, Sacramento described her case as "like an

electronic prison." Any and all electrical systems in her environment, including the brain are targeted, controlled and manipulated 24 hours a day. The technique of stimulus, response as in a psychology experiment are used to find weaknesses and a breaking point." The CIA's LSD and military man-break experiments used extremes of stress in similar way. Welsh's case is like the unwitting radiation victims who went to hospitals and were experimented on. She too happened to be in the wrong place at the wrong time when the U.S. government was looking for unwitting victims to establish baseline studies for military purposes.

Welsh has alleged that scientists are studying her brain to establish the limits of the technology. In the 1940s, the effects of a radiation dose of a plutonium vitamin were not known. Similarly, science has not established the military uses and health effects of microwaves and other electromagnetic frequencies. Like radiation victims, electromagnetic victims today are discounted. In spite of these hurdles to overcome, Cheryl is determined to stop this ongoing experimentation and to prove that it is real, even if it is invisible and classified.

Here is a book excerpt in support of her allegations. From *Mind Wars* by Ron McRae, St. Martin's Press, 1984. Mr. McRae served five years in the Navy and worked with columnist Jack Anderson in 1979. He is a correspondent for *The Economist*.

There is, according to the best sources, a real threat in the electronic manipulation of the human mind. The possibility arose from research that attempted to explain telepathy electromagnetically. Unfortunately, although the researchers did not discover, as they sought, that thoughts could influence long-range electromagnetic radiation, they did discover that long-range electromagnetic radiation might influence the mind. According to Barbara Honegger [Barbara Honegger was on the Reagan White House staff], "the fundamental reason for the increased interest" in psychic warfare, and the area where the Pentagon spends most of its estimated six-million-dollar annual budget for psychic or related research, "is initial results coming out of laboratories in the United States and Canada that certain amplitude and frequency combinations of external electromagnetic radiation in the brain-wave frequency range are capable of bypassing the external sensory mechanism of organisms, including humans, and indirectly stimulating higher-level neuronal structures in the brain. This electronic stimulation is known to produce mental changes at a distance, including hallucinations in various sensory modalities, particularly auditory.

There are over 1,000 networking victims, according to the organization Citizens Against Human Rights Abuse, one of several human rights groups documenting this issue. They all describe torture, which makes sense as the U.S. government is developing electromagnetic weapons that kill. Victims are describing several sets or clusters of symptoms and it would support the logical conclusion that today, there are many different classified government experiments and umbrella projects and so there are different descriptions. Every nerve of the body and mind can be remotely targeted, manipulated and controlled. Pain can be inflicted and used along with behavior modification techniques.

This quote is another of the many fact in support of victim's allegations. From *The Mind Manipulators*, A non-fiction account by Alan W. Schefflin and Edward M. Opton, Jr., Paddington Press Ltd. 1978. Mr. Schefflin taught at Georgetown University and Mr. Opton is a graduate of Yale, Duke and UC Berkeley. The book jacket stated;

Ten thousand pages of formerly top secret U.S. army and C.I.A. documents prove that for twenty-five years United States government agencies undertook the most extensive mind-manipulation program in the history of the world. Every conceivable method for molding the mind was explored and refined, many of them tested on unwitting American citizens.

Psychologists, psychiatrists physicians, prison officials, scientists, lawyers and politicians have, for decades, been involved in mind-control research in hospitals, laboratories, universities, mental institutions, medical offices, prisons and schools.

Thoughts can be read remotely and played back; another person will repeat exactly what the victim just thought. Brainwashing and personality breaking techniques are used. Microwave hearing, the hearing of voices beamed into the victim's head via microwaves is reported in most cases. There are many articles in the open literature discussing "microwave hearing". Dr. Becker wrote the book *Body Electric* in 1985 and reported that "in 1973 Dr. Joseph C. Sharp of the Walter Reed Army Institute of Research heard and understood spoken words beamed to him in an echo-free isolation chamber via a pulsed-microwave audiogram (an analog of the words' sound vibrations) beamed into his brain. Such a device has obvious applications in a covert operation designed to drive a target crazy with "voices" or undetectable instructions

to a programmed assassin."

Victims also allege that dreams and memories are manipulated. Movements and consciousness, heart rate and many bodily functions are reportedly monitored and controlled. These and other symptoms can be correlated to the past well documented mind control research and the extrapolation to the highly likely fact that the mind control research is continuing and is as classified as a Manhattan Project. One example of the history of mind control research is from *The Search for the Manchurian Candidate* by John Marks, Times Books, 1979 p. 164.

Chapter 10 The Gittinger Assessment System. While on the CIA payroll, toiling to find ways to manipulate people, Gittinger created a unique system for assessing personality and predicting future behavior. He called his method-appropriately-the Personality Assessment System(PAS)....it was Gittinger, the staff psychologist, who sold his PAS system to cynical, anti-gimmick case officers in the Agency's Clandestine Services. And during the Cuban missile crisis, it was Gittinger who was summoned to the White House to give his advice on how Khrushchev would react to American pressure. ...He was building a unique data base on all phases of human behavior and he needed samples of as many distinct groups as possible. ...In huge numbers, the Wechslers,[a personality test] came flowing in-29,000 sets in all by the early 1970s-each one accompanied by biographic data. ...In 1962 Gittinger and his co-workers moved their base of operations from the Human Ecology headquarters in New York to a CIA proprietary company, set up especially for them in Washington and called Psychological Assessment Associates. ...In 1973 John Gittinger and his longtime associate John Winne, ...published a basic description of the PAS in a professional journal. ...In 1974, I wrote about Gittinger's work in Rolling Stone magazine. Gittinger was disturbed that disclosure of his CIA connection would hurt his professional reputation. ...He saw no ethical problems looking for people's weaknesses"... ...In August 1977 Gittinger publicly testified in Senate hearings.

Another example is from *The Mind Control Papers*, ISBN 0-915509-35-3, 1980. Published in Freedom News Journal. Based on released CIA documents.

17 December 1963 Memorandum for: Deputy Director of Central Intelligence. Subject: Testing of Psychochemicals and Related Material. By brain-computer radio communication cognitive manifestations such as thoughts and visual impressions or emotions, behaviour and psychological reactions can continually be registered, making it possible for secret police authorities, medical scientists and the state to observe an individual in a deeper and more comprehensive way than the person could possibly do himself. As far as we are able to ascertain, documents which trace the developments in this gruesome science have been drafted as long ago as 1951 when the CIA decided to coordinate efforts with the army, navy and air force, and Project Artichoke was born. A 1952 memorandum describes its mission as follows: Evaluation and development of any method by which we can get information from a person against his will and without his knowledge. Can we get control of an individual to the point where he will do our bidding against his will and even against such fundamental laws of nature such as self preservation? How could we counter such measures if they are used against us?

[Contents](#)

Innumerable Victims Not Getting Help: One Major Obstacle

Most victims are labeled mentally ill but in fact are reporting a cluster of similar symptoms and have physical evidence to prove that mental illness is not the cause. Usually relatives, police or lawyers who have no knowledge of the technology demand a psychiatric evaluation and that is the end of any chance of justice for the victim. As is common practice, the psychiatric diagnosis is made based on the patient's account and the doctor or therapist's training. While the patient may present personal reports of high or unusual radioactivity and newspaper accounts of the current practice of surveillance of prisoners via satellite and scientific papers on classified electromagnetic weapons and reports on unclassified nonlethal weapons development over the last 40 years, this has not stopped a mentally ill diagnosis. Even with a history of long term good mental health, the psychiatrist has diagnosed schizophrenia. The fact that "microwave hearing" or "synthetic telepathy" is a documented military weapon is considered irrelevant.

Headlines such as "FBI Wanted to Test Mind Control Device on Koresh " by the Press Association Newsfile, March 3, 1994 have not been linked to the current victim's situation. Most psychiatrists have not considered the possibility that the U.S. government would today test electromagnetic weapons on the victim in their office. This alleged experimentation is rooted in Cold War mentality and because the guilty scientists don't want to get caught and the U.S. government does not want a public outcry, the alleged illegal

experimentation stays classified and continues. Here is an example from The Search for the Manchurian Candidate by John Marks, p 59.

The CIA's secrecy was also clearly aimed at the folks back home. As a 1963 Inspector General's report stated, "Research in the manipulation of human behavior is considered by many authorities in medicine and related fields to be professionally unethical"; therefore, openness would put "in jeopardy" the reputations of the outside researchers. Moreover, the CIA Inspector General declared that disclosures of certain MKULTRA activities could result in "serious adverse reaction" among the American public.

Victim's allegations are plausible since scientists would need to know the human effects of electromagnetic weapons. The proof is growing as the governments now want to use this technology and are declassifying some of it. Here is an article that describes weapons that match victim's symptoms. STILL UNDER WRAPS, Aviation Week & Space Technology, June 7, 1993 p. 35.

The recent Branch Davidian Standoff in Waco, Tex., prompted interagency debates about deploying new nonlethal, disabling weapons, according to a congressional aide. The Army, Air Force and Central Intelligence Agency all have developed some of the specialized arms. One is an optical munitions that produces bright laser lights causing temporary blindness. Low-frequency acoustic beams can inflict disabling pain. High-tech power generators can destroy electrical devices, including communications. In the end, it was decided to keep information about the weapons under wraps. This was done to avoid tipping off potential foes about how far the technology has advanced.

The fact that the U.S. government has a well-documented history of illegal behavior control experiments on U.S. citizens is not linked to the fact that there are abundant examples of recent experimentation and government abuse such as the Gulf War Syndrome in which veterans were misdiagnosed with stress-related illnesses. Again, this has not been linked to the current victim and a diagnosis of psychosis or delusions is made if the patient discusses government surveillance, even though government motive and technology is documented and presented.

Also, the ordinary victim has tremendous financial and practical problems in presenting proof of radiofrequency weapons used on themselves. Microwave sickness is still controversial and not well documented in the U.S. medical literature. Many other problems exist such as the fact that the perpetrators could easily turn off the signals when the victim attempted to monitor for signals with a spectrum analyzer, which is very expensive equipment.

Victims of torture and traumatic experiences have difficulty describing their experience to others. It often sounds 'crazy' and is very painful to recount. This is no small problem as seen in the following example. The New York Times, Dec 21, 1997 article "Learning to Assess Accounts of Torture" reported that immigration officers took classes to identify signs of torture so that they could "better judge whether refugees are truly the victims of torture and deserve Government protection." Immigration officers were taught to listen to refugee's accounts of why they must stay in the U.S "without touching off an onslaught of traumatic memories for the refugee."... "Torture survivors are arriving with symptoms that are becoming more difficult to discern." ... "Tragically, torturers around the world are becoming increasingly sophisticated in the methods they use" said Dr. Allen S. Keller. The training included discussions of sleep deprivation, mock executions and other forms of psychological torment that leave no telltale marks."

Slowly, medical doctors are realizing that the technology exists and victims allegations are based in reality. On November 24, 1997 in the Spotlight, Dr. Byron T. Weeks, MD and retired reserve colonel USAF, MC wrote in support of Shirley Allen, the Illinois woman who was under a six week siege by state police. Her relatives wanted her to go for a mental health exam and she refused. Mrs. Allen, a 51 year old widow and nurse "... is a citizen with an exemplary record, who has never committed a crime against society....She has not been a demonstrable threat to her neighbors, and is almost universally respected as an upstanding citizen." She was deprived of water, plumbing, electricity and heat by authorities until the siege ended by force. "Widespread criticism of police was reported at the national level according to the Illinois Sun-Times Oct. 31, 1997. Mrs. Allen claimed someone was "directing radar waves" at her. Dr. Weeks stated "This may not be as irrational as it sounds, in view of the reported use of Extra-Low Frequency (ELF) electromagnetic waves, attuned to the human brain waves, that can induce visual and auditory hallucinations."

A lawyer and psychiatrist have submitted letters of support of two more mind control victims. The letters were recopied with background information in U.S. GOVERNMENT MIND CONTROL EXPERIMENTS ON CHILDREN COMPILED BY JON RAPPAPORT, (213) 243 9005. Author's Note: Originally, Valerie Wolf and her patients were invited to testify before the Committee because doctors named by these patients as

involved in administering mind control had also previously, been named by radiation victims as doctors who gave them doses of radiation. ADVISORY COMMITTEE ON HUMAN RADIATION EXPERIMENTS, 1726 M ST. N.W., SUITE 600 WASHINGTON, D.C. 20036.

The Advisory Committee on Human Radiation Experiments is a 14-member committee of nationally recognized experts in the areas of bioethics, history of science, radiation biology and oncology, epidemiology, law and nuclear medicine. The Committee also includes a public representative. Appointed by the President in April 1994, the members are to prepare a report due in 1995, about the use of human beings as subjects of federally funded research using ionizing radiation.

Valerie Wolf, therapist: "I am here to talk about a possible link between radiation and mind control experimentation that began in the late 1940's. The main reason that mind control research is being mentioned is because people are alleging that they were exposed, as children to mind control, radiation, drugs and chemical experimentation which were administered by the same doctors who are known to have been involved in conducting both radiation and mind control research. Written documentation has been provided revealing the names of people and the names of the research projects in statements from people across the country. It is also important to understand that mind control techniques and follow ups into adulthood may have been used to intimidate these particular research subjects into not talking about their victimization in government research."

Dr. Colin Ross, psychiatrist and author of books on dissociative identity disorder (DID): "I became interested in CIA and military mind control when patients with DID began describing involvement in mind control research occurring on military bases and in hospital settings. ...I began to do background reading and research on mind control in 1992. ...Drs. Orne and West (UCLA) are still alive. ...They and many other still living individuals could be called to testify at hearings. ...Although the reality of this research is not documented, the possibility that it is real is so serious that a formal investigation is warranted. Although some or many of the DID patients' memories may be distorted or inaccurate, it is not plausible that the CIA and military intelligence agencies simply stopped this research in 1973, as they claim. ...I would be pleased to testify at length at any hearings on CIA and military mind control. Sincerely, Colin Ross, M.D.

March 9, 1995, To Whom It May Concern: My name is Alan W. Schefflin. I am a Professor of Law at Santa Clara University Law School, and a judicially recognized expert in mind and behavior control. I co-authored a nonfiction book about government mind control programs entitled "The Mind Manipulators," which was published in a dozen countries....I am writing in support of the testimony of Claudia S. Mullen and for the purpose of encouraging the opening of secret government files on radiation and on mind control. ...I know that many of the stories that will be told by witnesses will sound unbelievable. Please do not dismiss them out of hand. ...Release of remaining documents on secret government experiments is in the public interest and would not threaten national security. ...It would be my pleasure to supply any additional information requested. Sincerely, Alan W. Schefflin, Professor of Law.

The British Medical Journal Volume 315, July 12, 1997 p.72 by Robin M. Coupland, Surgeon and editor of the SirUS Project, International Committee of the Red Cross wrote an article entitled "Non-lethal weapons: precipitating a new arms race, Medicine must guard against its knowledge being used for weapon development". He wrote about "...devices generating infrasound or electromagnetic waves, and devices for riot control." He then states "Rather than sutured wounds, skin grafts, or amputations, will the soldiers who have survived battlefields of the future return home with psychoses, epilepsy, and blindness inflicted by weapons designed to do exactly that?" It is critical that physicians and psychiatrists are aware of this problem, investigate and speak out.

Victims Are Not Getting Help: How Health and Human Rights Issues Are Handled by Our Present System

A good analogy of why victims have not been helped and the problems involved, can be found in the history of smoking and tobacco companies. Since the 1960s, the harmful health effects of cigarette smoking has been known but that did not stop the tobacco companies from exploiting and profiting from cigarettes for 50 years. The dark side of human nature and entrenched government bureaucracy are a few of the underlying reasons. Similarly, nonconsensual government experimentation using electromagnetic technologies has not been resolved for almost 50 years.

The August 31, 1997 New York Times Magazine article by Michael D'Antonio entitled Atomic Guinea Pigs stated the following.

For decades, those who claimed to be victims of clandestine radiation experiments conducted by the United States government were dismissed as paranoid. At the Department of Energy, which oversees America's nuclear-weapons research, these people were referred to collectively as "the Crazies." but the opening of cold-war archives has brought the Crazies in from the fringe.

It is a consistent pattern of human nature to call the victim crazy. This is repeating for hundreds of electromagnetic victims. Also, governments such as Russia have used psychiatric illness to frame 'enemies of the state' such as Alexandr Solzhenitsyn and Andre Sakarov. To a lesser extent, the U.S. has discredited 'subversive elements' in counterintelligence programs, (The Watergate burglars broke into the psychiatrist's office of Daniel Ellsberg of Pentagon Papers fame, to steal his records, ostensibly to find damaging evidence.) Knowing these facts of human nature and political repression should help in correcting this problem. When Seymour Hersh, the highly respected investigative journalist wrote books and articles on biological warfare in the 1960s, he was reported to have "regularly received twenty-page reports from various persons alleging incredible CIA ventures into brainwashing and mind-control, Frankensteinian technology, conspiracy with the UFO monsters." This was reported in Psychic Warfare, edited by John White, 1988. In an essay by Michael Rossman, p 142-3, he also reported receiving letters about victims of experiments in telepathic control conducted by military psychologists. Another victim reported parapsychological means of a spying plot. Rossman then concluded " I thought you were crazy. ...Nor had I collected until now the data to suggest plausibly that the CIA et al. might actually have had the means and purposes to do what you [the victim] describe."

I can only add the innumerable accounts of victims trying to obtain help from the U.N., the ACLU, the FBI, the Department of Justice, the FCC, Congress, lawyers, etc. Some electromagnetic scientists such as Dr. Ross Adey at UCLA and authors such as Dr. Robert Becker, (Electromagnetic Man) and Paul Brodeur, author of The Zapping of America, all have reported hundreds of letters from victims dating back to the 1960s. Martin Cannon, a mind control researcher wrote in the British magazine, Lobster an article entitled Mind Control and the American Government, 1993 that many senate and congressional and state representatives have a 'wavie' file, allegations and pleas for help by victims of clandestine bombardment with non-ionizing radiation or microwaves. Mary Ann Dufresne of Senator Glenn's office has received volumes of mail from victims alleging illegal experimentation. (Per phone call November 1997.) Senator Glenn is the sponsor of S193, the Human Research Subject Protections Act of 1997, which has stalled in the Committee on Labor and Human Resources.

This is large group of people that have not been helped for a very long time. Now is the time to do something about this.

Brian Wronge is a typical case of an implant victim who did not get help. Maitefa Angaza of The City Sun, Dec. 21, 1993 in an article, "SciFact-Not Fiction: High-Tech Slavery Is Here" reported Wronge's allegations of experimentation and his fears of being harmed if he exposed this. He was "shuffled back and forth to several prisons and psychiatric facilities in an attempt, he believes to build a criminal and psychiatric profile on him and discredit any charges he might make in the future."

Roger Hutcheon of the Physicians for Human Rights (PHR) followed up on Wonge's story in a City Sun article entitled "Implant Victim Refused Help by Humanitarian Physicians". "The Boston chapter of PHR refused last month to examine or treat government implant victim Brian Wronge, against protest of some of its members." A CT scan report by MRI-CT Scanning Inc. and MRI report by Diagnositc Imaging Associates, both of New York were both positive for "paramagnetic metallic foreign bodies" in his head and chest in 1991.

"A federal Eastern District court judge Justice Reena Raggi, has Wrongs's lawsuit against the state of New York pending, instructing Wronge to find a surgeon to remove one of the implants. However, in the three years since the may 1991 lab reports, no surgeon would remove the implants, usually citing FBI retaliation as the reason." "The PHR board, according to director Eric Stover, decided in a meeting in mid-June to refuse assistance to Wronge." PHR formed in 1986, has a large membership and a documented mandate of this group is 1. To stop torture that is committed by a government.

Again, this fits the history of government mind control. A Washington Post August 7, 1977 article by John Wilhelm stated that Dr. Andrea Puharich invented a miniature tooth radio, reportedly for the CIA, back in the 1950s. He presented a paper in 1952 to a Pentagon conference entitled "On the Possible Usefulness of

ESP in Psychological Warfare".

And the negative impact of the national security act on victim's efforts to obtain help cannot be overemphasized. After 50 years of classified research, there is overwhelming evidence that the military and corporations are involved in mind control. And there is no oversight mechanism to stop the pattern of electromagnetic technology abuses. This is a compelling example. From *Angels Don't Play This Haarp*, *Advances in Tesla Technology*, by Dr. Nick Begich and Jeane Manning, Earthpulse Press, 1995.

Page 5. The HAARP (High-frequency Active Auroral Research Project) story, when first viewed from a limited exterior viewpoint, looks like a harmless research project. When viewed from a wider perspective, we begin to see that HAARP is a secret undertaking that is not unlike the Manhattan Project which gave us the atomic bomb.

P. 104-6. E-Systems was the subject of a lengthy article in the Washington Post by staff writer John Mintz {October 24, 1994, p. A1,A10.}. He disclosed that E-Systems' technologies were "part of the central nervous system for the nation's intelligence community". \$1.8 billion of their \$2.1 billion in sales, was for classified projects. A large part of the projects came from the National Security Agency (N.S.A.) and Central Intelligence Agency (C.I.A.) and other intelligence organizations. Many of the company employees are former personnel from the N.S.A., C.I.A. and military retirees. People with highly technical backgrounds and a history of working in government intelligence circles are hired by the company almost automatically, according to the Washington Post article. Retired Navy Admiral William Raborn, C.I.A. director under Lyndon B. Johnson, for years served on the board of directors.¹³⁹ Did the C.I.A.'s favorite contractor and, the world of high-tech transmitters and joined in the HAARP program?

E-Systems was one of the featured stories in a CBS, 60 Minutes segment which was aired February 26, 1995. The report echoed the assertions which were made in the Washington Post article. The company was described as an organization operating in the "black world" --an area so secret that employees are not permitted by law to discuss anything about their work except with those individuals who have an official "need to know" classification. Of the company's annual sales, 85 percent was for classified work, with an estimated \$800 million involved in projects so sensitive that the government denies that the projects even exist. The story went on to paint a picture of an organization which thrives on contracts issued by the C.I.A., N.S.A. and military intelligence organizations.¹⁴⁰ (E-Systems, 60 Minutes, CBS News, N.Y., N.Y., February 26, 1995.

P. 106. Could the marriage of technologies in these companies create the possibility of those types of uses contemplated in intelligence bloodless warfare and manipulation of mental functioning? E-Systems has amassed huge capabilities for the most secret organizations in the country, and the gained control of the HAARP technologies. (And now Raytheon owns E-Systems, according to the authors.)

There are complex contributing factors to the problem of government mind control. This has been an overview of some of the main points.

[Contents](#)

Conclusion

The evidence is growing. Government mind control is no longer science fiction. The problem is very serious and relevant to every U.S. citizen's future. This is the weapon that intelligence, military and police agencies have always pursued, a weapon of total control over the enemy. The world super powers are motivated to keep this powerful technology classified and have resources that victims do not. It is up to the U.S. public to stop nonconsensual experimentation and illegal domestic intelligence programs using electromagnetic and neurological technologies on U.S. citizens.

1. New: 2001 law cited by The Los Angeles Times January 2005 article.

Translation by Ramon Ruelas.

Russian copy posted [here](#).

Please note: One of the draft addendums (official note) is posted here: <http://mindjustice.org/1-02-6.htm>

Mind Justice will continue to research this law in order to obtain the final version of the addendum or official note referred to in the 2001 law and the 2005 Los Angeles Times article.

On the introduction of an addendum to Article 6 of the Federal Law "About Weapons" Accepted by the Governmental Duma on 28th June, 2001

Article 1. Paragraph seven of point 1, Article 6 of the Federal Law from 13 December 1996, No. 150-FZ "About Weapons" (meeting of the legislation of the Russian Federation, 1996, (No. 51, pg. 5681) after the words "of biological factors;" to supplement with the words "weapons and other objects, whose damaging effect is based on the use of electromagnetic, light, thermal, infrasonic or ultrasonic emission and which have the output parameters which exceed the values established by the state standards of the Russian Federation and which correspond to the standards of the federal organ of executive power in the area of public health, and also indicated weapons and objects produced beyond the limits of the territory of the Russian Federation;".

Article 2. The actual federal law becomes effective from the day of its official publication.

President

Russian Federation

V. Putin

Moscow, Kremlin

26 July, 2001

No. 103-FZ

3. New: No new information has surpassed the work of russian lawyer and Duma member, V.N. Lopatin.

Below is a brief summary of his dedicated ten years of russian legislative work on banning mind control weapons, which resulted in the 2001 law above. Further information is available at www.mindjustice.org under Russian Translation Project.

For over ten years, V.N. Lopatin has been prominent and influential in the Russian government. He has advocated the banning of Russian mind control weapons and has taken this cause to the UN. Mr. Lopatin has a law degree and was a member of the state Duma of Russia. His 1999 book, Psychotronic Weapons and the Security of Russia includes an outline of the threat of psychotronic weapons and war and the importance of public relations concerning this global threat. Psychotronic weapons include electromagnetic weapons which target the brain and nervous system. He writes of the proposed Russian federal law 'Informational-psychological safety' concerning the protection and defense of rights and lawful interests of citizens and society.

Mr. Lopatin, is mentioned in two unclassified government documents excerpted below, received under a freedom of information act request. A Moscow Russian Public Television program on Oct 6, 1995 entitled Man and Law, Scientists Discuss Mind Control Technology included an interview of Lopatin.

State Duma expert Yuriy Lopatin calling for legislation banning illegal development and sale of mind-control devices.

...A State Duma expert, Yuriy Lopatin says: "Psychotronic Technology is spreading illegally. A law banning the illegal development, production, retailing, and spreading of psychotronic devices which influence the minds and behavior of citizens is badly needed." He goes on to say: "The use of the mass media for psychological experiments should be banned and all the state-ordered research in human genetic experiments should be strictly registered." This was approved by Georgiy Georgiyevich Rogozin, first Deputy Head of the Presidential Security Service.

See also Bulletin of Atomic Scientist, Jan/Feb. 1991 Renegade Russians Grab For Military Control by Jennifer Scheck Lee which reported, "...Yeltsin's September 1990 choice of Lopatin, a former navy officer equivalent to major, to head the republic's new State Committee on Public Security..." The 1990 Xinhua article excerpt below describes Lopatin's visit with US Defense Secretary Richard Cheney and Lopatin's press conference at the National Press Club.

The Xinhua General Overseas News Service; Xinhua News Agency, October 11, 1990, US defense secretary to visit Moscow

Cheney will stop over in London on his way to Moscow and in Paris on the way back. William's also disclosed today that yesterday, Cheney met with a young soviet military 'reformer', Major Vladimir Lopatin, and had a 'private conversation' with him. He declined to reveal the contents of the conversation. Lopatin, who addressed a press conference at the national press club here today, is in the United States on a visit hosted by 'Global Outlook,' a research institute.

Lopatin continues to be active in russian government security policy according to the Arminfo News Agency, October 7, 2004 entitled, Armenian Parliamentary Vice Speaker Proposes Elaborating single Approaches to Self-Proclaimed Republics within Framework of CIS. The article described Lopatin as Deputy Director of the National Research Institute of the Prosecutor General's Office of Russia and his work on inclusion of the issue of recognition of the Armenian Genocide into the agenda of the next session of the commission.

Mr. Lopatin is by far, the most powerful and prominent public figure in the world to advocate a ban on mind control weapons. The 2000 Segodnya article below can be found in Lexis-nexus database and includes a great overview of the 2001 law.

What The Papers Say (Russia)

February 14, 2000, THE RIDERS OF THE "PSYCHOTROPIC" APOCALYPSE

SOURCE: Segodnya, February 11, 2000,

BYLINE: Andrei Soldatov

HIGHLIGHT: THE RUSSIAN DEPUTIES INTEND TO DISCUSS THE DRAFT LAW ON INFORMATION SECURITY IN THE COUNTRY. THIS DECISION AROSE FROM THE FACT THAT THE US ALLEGEDLY CREATED A LOT OF DEVICES, WHICH CAN DESTROY INFORMATION SYSTEMS IN RUSSIA AND INFLUENCE THE POPULATION.

(...)

According to "Segodnya," currently the Duma is actively discussing the draft law on the information-psychological security submitted by Vladimir Lopatin. It is possible that the fruit of ten years of work (the works on the draft law began in 1990) will be discussed in the first reading in April.

(...)

Such laws have never been discussed in any country. But this fact does not embarrass the deputies because they discovered that the enemy, which threatens Russia in this sphere, is dreadful and powerful. Secret methods of information-psychological influence can not only harm a person's health, but also lead to "the loss of people's freedom on the unconscious level, the loss of capability of political, cultural and other self-identification, manipulations with social consciousness" and even "the destruction of a common informational and spiritual integrity of the Russian Federation".

At the same time, the law does not explain why the application of these methods is so destructive. During private talks, the developers of this draft law refer to certain "psychotropic weapons". Journalists of "Segodnya" tried to find out if there are any grounds for the rumors about such weapons.

It should be admitted that our potential enemy has compelled us to talk about "psychotropic" or "psychical" weapons. Here is a selective list of the newest American military achievements:

portable lasers and isotopic oscillators, which blind enemy soldiers, subsonic generators, which not only disorientate the enemy but also cause nausea and diarrhea, and also noise generators, which influence hostile and excited crowds. Or "water foam," for example. It is a gas which creates a foam that disorientates the enemy.

Almost all these technologies have been developed in the famous laboratory in Los-Alamos within the framework of the national program aimed at creating of so-called non-mortal weapons.

(...)

The non-mortal weapons created in the laboratory in Los-Alamos are closely connected with so-called "information weapons," which allegedly influence battle hardware: according to Alexander Starovoitov, former Director of the Federal Agency of Governmental Liaison and Information (FAGLI), the information weapons represents an arsenal of devices for unauthorized access to information and for destroying electronic control systems. But Russian people believe that such weapons can be used against not only enemy soldiers, but also the population of the country.

In 1996, Timothy Tomas, analyst of the Center for Researching Foreign Armies (Fort Livenwort, Kansas), who studied the prospects of the Russian science in the sphere of information weapons, tried to explain this phenomenon. According to Tomas, historically the Soviet Union conducted research in the sphere of information control. One of the most interesting methods, which makes it possible to manipulate information, is called "a method of reflexive control." The essence of this method is to give the enemy information, which will force it to act as the sender of the information that the other party wants. This theory was created in fiftieth by the first computer center of the Defense Ministry known as military object No.01168.

In addition, Tomas states that the USSR worked on the theory of misinformation, the application of which causes the population of a country to refuse to help its own army during a military conflict.

To all appearances, the Russian military and deputies concluded that Americans have managed to advance further than the Russian scientists in the sphere of manipulating the population after they learned about the new weapons created in the US. This fear has developed into a firm belief when the sums which the US spends for creating information weapons became known. According to FAGLI, the expenditure of the US for creating information weapons has increased by four times during the last 15 years and currently this expenditure takes first place among the expenses for all military programs.

The panic grew, when in 1996, the leadership of FAGLI announced that the effect produced by information weapons can be compared only with weapons of annihilation. FAGLI prepared and published analytical information under the title "Information Weapons as a Threat to the National Security of Russia." As a result in 1997, the Duma and the CIS Inter-Parliamentary Assembly appealed to the UN, OSCE, and the Council of Europe with a proposal to pass an international ban on information wars and demanded that the turnover of information weapons be limited. In March, 1998, this issue was raised at the meeting with General Secretary of the UN Kofi Annan. On the initiative of Russia, this issue was entered into the agenda of the UN General Assembly.

Later, such strict rhetoric was explained. Alexander Starovoitov, former General Director of FAGLI, stated that an information attack may destroy all electronic controlling systems, which are used by the Defense Ministry, and the state infrastructure. The Army and the Navy will not be able to respond to such aggression. The leaders of the country will not be able to receive information about the situation in the country and will not take necessary actions accordingly. Due to the consequences of the use of such weapons, the government decided to allocate additional money for protecting the governmental communications systems...

In addition to FAGLI, the Defense Ministry became interested in information weapons counting on money allocated by the government for the development of such weapons. As a result of the lobbying on the part of the security ministries, the State Commission for Military Construction decided to insert information weapons into the list of the three priority factors of the Russian potential of deterring possible aggressions (together with the Strategic Nuclear

Force and the systems of high-precision weapons). Civilian structures wanted to receive money for researching the problem of information-psychological security too. The Research Institute of Psychology of the Russian Academy of Sciences became an active creator of the draft law submitted by Vladimir Lopatin.

The point of view of the special services on this problem is not clear. On the one hand, FAGLI stated that it refuses to give an appraisal to the law before the government announces its official position. On the other hand, an official of FAGLI participated in creating this draft law.

4. New: Brief example of the extensive and very open, although controversial, russian public discussions, government documents, journal and newspaper articles on nonlethal weapons and mind control, after the break up of the Soviet Union.

The US government official position is that US mind control weapons are classified or that there are no US government mind control weapons programs. See http://mindjustice.org/experts_6-05.htm for US position on mind control. For extensive information on russian mind control see russian section at www.mindjustice.org. Here is just one example.

June 27, 2000, Tuesday Itar-Tass Russian press review of June 27

The key topics covered by the Russian papers on Tuesday were the economic policy of the Russian government, Russia's information security doctrine, and the Russian State Duma having passed a bill on a new procedure to form the Federation Council upper house of parliament.

...

ON RUSSIA'S DOCTRINE OF INFORMATION SECURITY

The Rossiiskaya Gazeta offered its comments on the problem, saying that "to ensure the information security Russia has not only to solve theoretical problems so that new-generation threats could be checked and brought under control, but to work out a corresponding legislative base."

The Nezavisimaya Gazeta stated that "according to the authors of the idea, the new structure should display a coordinated state policy on the issue."

5. Mind Control weapons information continues to grow:

US journal articles on russian mind control weapons by Mr. Timothy L. Thomas, a military analyst at the US Army, Department of Defense, Foreign Military Studies Office, (FMSO), Fort Leavenworth, Kansas.

Here is an excerpt from Military Review, September-October 1999, Human Network Attacks by Mr. Timothy L. Thomas, posted on the FMSO website at; <http://fmso.leavenworth.army.mil/>

China and Russia, in addition to studying hardware technology, data processing equipment, computer networks and 'system of systems' developments, have focused [on] 'new-concept weapons,' such as infrasound weapons, lasers, microwave and particle-beam weapons and incoherent light sources. ...The Chinese military apparently believes these devices will be used in future war since its doctors are investigating treatment for injuries caused by special types of high-tech or new-concept weapons.

In the past half century the potential for working on the consciousness, psyche or morale of a person, society or the composition of an armed force has grown dramatically. One of the main reasons is the considerable success achieved by many countries in their systematic research in the areas of psychology, psychotronics, parapsychology, other new psychophysical phenomenon, bioenergy, biology and psy-choenergy in the fields of security and defense.

...In fact, the information-psychological factor is so important to the Russian military that it considers the information-psychological operation as an independent form of military activity.

Psychotronics is defined as 'an inter-disciplinary area of scientific knowledge, which, mediated by consciousness and by perceptual processes, investigates distant (noncontiguous) interactions among living organisms and the environment. It studies the energy and information phenomena of such interactions.' See V.D. Tsgankov and V.N. Lopatin, *Psikhotronnoe Oruzhie i Bezopasnost' Rossii*, Moscow 1999.

A psycho-physical (psychotronic) weapon is defined as 'a technically generated means designed to exert an information and/or energy influence on the functions of the human psyche and on the physiological functioning of human organs and systems. It belongs to the category of non-lethal weapons.' See M.I. Abdurakhmanov, V.A. Barishpolets, V.L. Manilov, V.S. Pirumov, *Geopolitika I Natsional'naya Bezopasnost'*, Moscow, 1998

Mr. Thomas' work was cited as an explanation for claims of mind control victims in July/August 1998, *Bulletin of Atomic Scientists*, All in the (Russian) mind? by Linda Rothstein;

From time to time, the Bulletin gets letters from people claiming to need help because the FBI is controlling their minds through radio waves. Some say their troubles started when they were secretly operated on; others claim that agents inhabit the apartment above, below, or across the street--from which are directed subliminal messages that cause the letter writer much grief.

Mr. Timothy L. Thomas, an analyst at the Foreign Military Studies Office at Ft. Leavenworth, Kansas, has a term for such assaults on targeted individuals- "psychotronic warfare." And when it comes to developing the tools to succeed in this apparently burgeoning area, he says, the Russians are way ahead. "Information warfare," Thomas explains in the Spring 1998 issue of *Parameters*, is usually aimed at disrupting modes of communication--telephones, satellites, computers, and so on. But what many US advocates of information warfare have not realized is the importance of targeting the human body, the weakest link in the information chain.

6. Post cold war soviet weapons developments: Darpa reports by Mary C. Fitzgerald, research fellow at Hudson Institute.

Mary C. Fitzgerald is a research fellow at Hudson Institute, a Washington based public policy think tank. Her areas of expertise are defense and national security issues, Russian, Eastern European, and Eurasian studies, Russian military and US military. As reported on the Hudson Institute website at <http://www.hudson.org/>;

Since 1977, Mary C. Fitzgerald has analyzed Soviet/Russian military writings for the DOD [Department of Defense] with a view to defining central concepts in strategy, operational art, and tactics. In addition, she has published the following reports for the US Department of Defense: *Russian Views on Electronic and Information Warfare* (Volumes I and II), Winter 1996; *Russian MOEs for Electronic and Information Warfare*, Fall 1997; *Impact of the RMA on Russian Military Affairs* (Volumes I and II), Spring 1998; and *Impact of the RMA on Russian Military Affairs: Addendum*, Fall 1998.

Mary Fitzgerald has written an annual report for Darpa (Defense Advanced Research Agency) since 1996 which includes a considerable section on psychotronic weapons. The report is listed above as a US Department of Defense report. Dr. Fitzgerald travels to Russia, attends meetings and conferences with military officials and compiles the annual Darpa report on russian weapons. A freedom of information request to Darpa for the 1997 Darpa report entitled, *Russian Views on Electronic and Information Warfare* is still pending after almost two years. Many thanks to Tessa Puglia who found an outline of the 1997 report;

Russian Views on Electronic and Information Warfare

September 1997

For official use only

Thesis

Russian military scientists predict that the new RMA will drive future war toward exploitation of new physical principles, info warfare...

Future war will liberate man from the battlefield and be less physically destructive because its

main objectives are to affect the opponent's infrastructure and psychology. Victory will go to the side best able to execute the emerging "Sixth Generation" of warfare.

Overview

I. New Physical Principles

- Geophysical/ecological weapons
- High-frequency radio/electromagnetic wave weapons, infrasonic weapons
- Ethnic weapons
- Directed-energy weapons
- Psychotronic weapons
- Plasma weapons
- Non-lethal weapons
- Cost-effective
- Secrecy/surprise...

IV. New Physical Principles

High-frequency wave weapons (infrasonic weapons)

- Attack all life-sustaining physiological functions (circulatory and nervous systems, internal organs, etc.)
- Alarm, desperation, horror
- Mass onset of epilepsy, heart attacks, death
- Penetration of concrete, metal structures...
- Detect, monitor, protect against bio-emissions

IX. New Physical Principles

- Directed, non-contact EM fields in SHF/EHF bands
- More dangerous than atomic, etc.
- Suppress willpower/impose "criminal will"
- Radio waves disrupt brain, central nervous systems
- Infrasonic waves = fear, panic, etc.
- Directed irradiation = EM fields from electronic equipment
- Changes behavior, reactions to events
- Disrupts functional systems
- Causes morphological changes in cell tissue
- Penetrates brick, wood, concrete

X. New Physical Principles

- ... "Holographic laser"
- Radiation generator, receiver, device to transform reflected signals...
- Current phase based on artificial intelligence, expert systems, neural networks, transputers using "acquired" knowledge

"Most important objective may be affecting enemy's psychology"

- Individual, collective, mass
- Direct or indirect
- Destroy institutions, create mass disorder, etc.
- "Psychological weapons": psychotronic, psychotropic, infrasonic, electromagnetic...

III. Conclusions

New operations: "Supersystems" = jointness

- ...New Military-Technical Policy: "technological deterrence" = shift from material - to science-intensive
- Space-based C3I/EW = "supersystems"

[Contents](#) | [Top](#)

7. Brief analysis and conclusions:

Russians speak openly and pass laws on russian mind control weapons while the US says US mind control is classified or does not exist. This is critical information that is rarely reported in US press.

Reliable information on russian mind control weapons is difficult to find in the US. V. N. Lopatin is one of the few russian leaders who has consistently spoken out for over ten years. With the breakup of the Soviet Union, information on russian mind control weapons became available. While the long-term US/Russian interest in the weapons continues, less information is publicly available after 2000 as seen in the very few US military analysts who are writing about China and Russian electromagnetic weapons and mind control. This combination of factors is an indication of the very heavy classification and importance of the weapons. Now the 2005 Los Angeles Times reports "...In 2001, President Vladimir V. Putin signed into law a bill making it illegal to employ "electromagnetic, infrasound ... radiators" and other weapons of "psychotronic influence" with intent to cause harm. An official note attached to the bill said Russian scientists were trying to create "effective methods of influence of humans at a distance." There is no comparable US federal law. Much more research on this promising area of mind control is needed.

Available russian and US mind control weapons information reveal probable US cover stories for the US mind control weapons programs which are inevitably classified and developed. Claims by Israeli military officials that russian mind control weapon 'don't work' , as reported in this Defense News excerpt below, have also been reported by US officials. See http://mindjustice.org/experts_6-05.htm for further information.

Defense News, December 17-23 2001, Israel Fields Means to Suppress Palestinian Violence by Louise Doswald-Beck; ...In a Dec. 9 interview marking the close of his four-year term at the helm of Israel's formidable defense research and development sector, Ben-Israel, [Major General Isaac Ben-Israel] said his directorate explored different scientific and phenomenological fields-including mind control- in attempts to contain and deter terrorist activity. "We invested in this for a few years...but we determined that it was not effective," Ben-Israel said of mind control methods, many of which were developed by military and security agencies of the former Soviet Union.

Everyone can agree that if government mind control was an effective weapon, officials would never admit it. This raises serious questions and issues for both Russians and Americans. No government documents or proof of mind control weapons other than circumstantial evidence were ever publicly confirmed. As a result of national security, the needed reliable facts and information are not available for public discussion of mind control weapons in the US. Only with the momentous historical event of the break up of the Soviet Union did russian mind control weapons become public knowledge. Russian government officials such as Lopatin have revealed the existence of mind control weapons in laws to control the weapons. It is difficult to imagine what momentous event it would take for US officials to reveal US mind control weapons. 'Mind Justice will continue to update this groundbreaking russian law and the post-2001developments. Finally, Mind Justice will continue to gather evidence and report on the growing number of allegations of illegal government experimentation and use of these weapons on citizens worldwide, without their consent.

List of mind control symptoms,

whether the related technology is scientifically proven and if there is military interest or funding of the related technology

by Cheryl Welsh, March, 2003

Thank you to those who sent me much of this information:
Tessa Puglia, Harlan Girard, Margo Cherney, and John Ginter.

[Mind Justice Home Page](#)

Symptoms

- Microwave hearing
- Transmission of specific commands into the subconscious
- Visual disturbances, visual hallucinations
- Inject words, numbers into brain via electromagnetic radiation waves
- Manipulation of emotions
- Reading thoughts remotely
- Causing pain to any nerve of the body.
- Remote manipulation of human behavior from space
- Harassment, stress symptoms such as helicopters flying overhead
- Seeing, as in a camera, through your eyes, i.e. to see what you see exactly
- Control of sleep patterns.
- Computer-brain interface, control and communication
- Complex control of the brain such as retrieving memories, implanting personalities

Symptom

1. Microwave hearing. The hearing of voices in the head from an outside source, but nobody else can hear the voices except the targeted individual.

Scientifically Proven

1. Yes. Ultrascience III, *Spies are us*. Featured Dr. James C. Lin, Ph.D.. biomedical and electrical engineer, educator, author of *Microwave Auditory Effects and Applications*, 1978. Lin demonstrated microwave hearing, a symptom of many of the victims, hearing voices. Also featured Cheryl Welsh on the issue of mind control experimentation. *International Defense Review*, 3-1-93, *Special Operations Survives Pentagon budget Constraints*, Ramon Lopez. "JASORS, Joint Advanced Special Operations Radio System is being developed by Harris Corporation. ...is a very ambitious, leading-edge technology program, ...Whiles JASORS is a near-term SOF, (Special Operations Forces) enhancement, SORDAC, (Special Operations Research Development and Acquisition Center), is also investigating long-range (1998-2010) and "far-future" (2011 and beyond) weaponry and support equipment. [SORDAC's director, Army Colonel Douglas J.] Richardson said one far-future communications system being investigated is "synthetic telepathy." One day, SOF commandos may be capable of communicating through thought processes."

Margo Cherney FOIA request for complete NASA abstract Report Number: AD-A090426., June 1, 1980. Brooks Air Force Base, Jan.25, 2000. The requested information is fully denied under 5 U.S.C. 552(b)(1)..." NASA abstract in part stated, "A decoy and deception concept presently being considered is to remotely create the perception of noise in the heads of personnel by exposing them to low power, pulsed microwave. When people are illuminated with properly modulated low power microwaves the sensation is reported as a buzzing, clicking, or hissing which seems to originate (regardless of the person's position in the field) within

or just behind the head. The phenomena occurs at average power densities as low as microwatts per square centimeter with carrier frequencies from 0.4 to 3.0 GHz. By proper choice of pulse characteristics, intelligible speech may be created. Before this technique may be extended and used for military applications, an understanding of the basic principles must be developed. Such an understanding is not only required to optimize the use of the concept for camouflage, decoy and deception operations but is required to properly assess safety factors of such microwave exposure."

Microwave News, editor, Louis Slesin, Jan/Feb 1997 p 14. *U.S. Air Force Looks to the Battlefields of the Future: Electromagnetic Fields That Might "Boggle the Mind"* "It would also appear possible to create high fidelity speech in the human body, raising the possibility of covert suggestion and psychological direction. When a high power microwave pulse in the GHz range strikes the human body, a very small temperature perturbation occurs. This is associated with a sudden expansion of the slightly heated tissue. This expansion is fast enough to produce an acoustic wave. If a pulse stream is used, it should be possible to create an internal acoustic field in the 5-15 kHz range, which is audible. Thus it may be possible to "talk" to selected adversaries in a fashion that would be most disturbing to them."

Federal Times, Dec. 13, 1976 *Microwave Weapons Study by Soviets Cited*. The Defense Intelligence Agency has released a report on heavy Communist research on microwaves, including their use as weapons. Microwaves are used in radar, television and microwave ovens. They can cause disorientation and possibly heart attacks in humans. Another biological effect with possible anti-personnel uses is "microwave hearing." "Sounds and possibly even words which appear to be originating intracranially (within the head) can be induced by signal modulation at very low average power densities," the report said. According to the study, Communist work in this area "has great potential for development into a system for disorienting or disrupting the behavior patterns of military or diplomatic personnel." No mention was made of the still-unexplained microwave bombardment of the American Embassy in Moscow. The study dealt largely with long-term exposure of days or weeks in industrial situations, which usually produce mild effects. Short exposure to intense radiation can cause heart seizure and a wide range of physical disorders.

Military interest or funding

1. Yes. See above.

Symptom

2. Transmission of specific commands into the subconscious

Scientifically proven

2. Yes. Defense News, *US Explores Russian Mind Control Technology* by Barbara Opall January, 11-17-1993, p. 4. "Pioneered by the government-funded Department of Psycho-Correction at the Moscow Medical Academy, acoustic psycho-correction involves the transmission of specific commands via static or whitenoise bands into the human subconscious without upsetting other intellectual functions. Experts said laboratory demonstrations have shown encouraging results after exposure of less than one minute.

Janet Morris, reported in book Shukman, David. *The sorcerer's challenge : fears and hopes for the weapons of the next millennium*, David Shukman. London : Hodder & Stoughton, page 223. Demonstration on BBC television on news program entitled *Newsnight* by David Shukman, (tape available on request).

U.S. News, 1-3-2000, John Norseen, *Reading and changing your mind*. [Lockheed Martin neuroengineer in Intelligent Systems Division] Norseen's interest in the brain stems from a Soviet book he read in the mid-1980s, claiming that research on the mind would revolutionize the military and society at large. [He] coined the term "Biofusion" to cover his plans to map and manipulate [the brain] leading to advances in ...national security... and ...would be able to convert thoughts into computer commands by deciphering the brain's electrical activity. BioFusion would reveal the fingerprints of the brain by using mathematical models, [Smirnov's computer program uses mathematical models also]. It sound crazy,...The National Aeronautics and Space Administration, the Defense Advanced Research Projects Agency, ...have all awarded...research contracts to Norseen. Norseen is waiting to hear if the second stage of these contracts-portions of them classified- comes through. Norseen's theories are grounded in current science. ...By MRI, scientists can tell what the person was doing at the time of the recording...Emotions from love to hate can be recognized from the brain's electrical activity. ...Norseen predicts profiling by brain print will be in place by 2005. ...Norseen would like to draw upon Russian brain-mimicking software and American brain -mapping breakthroughs to

allow that communication to take place in a less invasive way. A modified helmet could record a pilot's brainwaves. "When you say right 090 degrees...the computer would see that electrical pattern in the brain and turn the plane 090 degrees. If the pilot misheard instructions to turn 090 degrees and was thinking "080 degrees," the helmet would detect the error, then inject the right number via electromagnetic waves."

Military interest or funding

2. Yes, Defense Electronics, *DOD, Intel Agencies Look at Russian Mind Control...* by Mark Tapscott, July, 1993 p. 17. "In a series of closed meetings...FBI officials were briefed on the decade-long research on a computerized acoustic device allegedly capable of implanting thoughts in a person's mind without that person being aware of the thought."

Also, US corp. buys Russian mind control equipment.

Symptom

3. Visual disturbances, visual hallucinations.

Scientifically proven

3. Yes. A demonstration by Dr. Elizabeth Rauscher and Dr. William van Bise, directed magnetic signals into the brain of reporter Chuck DeCaro. They created visual images as in a hallucination. This program features Dr. Robert O. Becker, two time Nobel prize nominee, scientist and researcher of electromagnetic radiation effects on the body and author of *Body Electric*, summarized, "The government has never disproved the psychological effects of electromagnetic radiation. "Dr. Robert Becker commented "that this is a substantial step forward in the understanding how the visual system works" and would be a powerful weapon if used on fighter pilots while trying to fly. For a 55\$ copy of this tape call CNN at 404 827 2712 and ask for R2501 #13, R2747 #33, R2501 #15, R2501-#17. It runs about 20 minutes.

Military interest or funding

3. Yes. See above.

Symptom

4. Inject words, numbers into brain via emr waves

Scientifically proven

4. Yes in Russia. Defense News, *US Explores Russian Mind Control Technology* by Barbara Opall January, 11-17-1993, p. 4. "Experts said laboratory demonstrations have shown encouraging results after exposure of less than one minute."

U.S. News, 1-3-2000, John Norseen, *Reading and changing your mind*. [Lockheed Martin neuroengineer in Intelligent Systems Division] Norseen's interest in the brain stems from a Soviet book he read in the mid-1980s, claiming that research on the mind would revolutionize the military and society at large. [He] coined the term "Biofusion" to cover his plans to map and manipulate [the brain] leading to advances in ...national security... and ...would be able to convert thoughts into computer commands by deciphering the brain's electrical activity. BioFusion would reveal the fingerprints of the brain by using mathematical models, [Smirnov's computer program uses mathematical models also]. It sound crazy,...The National Aeronautics and Space Administration, the Defense Advanced Research Projects Agency, ...have all awarded...research contracts to Norseen. Norseen is waiting to hear if the second stage of these contracts-portions of them classified- comes through. Norseen's theories are grounded in current science. ...By MRI, scientists can tell what the person was doing at the time of the recording...Emotions from love to hate can be recognized from the brain's electrical activity. ...Norseen predicts profiling by brain print will be in place by 2005. ...Norseen would like to draw upon Russian brain-mimicking software and American brain -mapping breakthroughs to allow that communication to take place in a less invasive way. A modified helmet could record a pilot's brainwaves. "When you say right 090 degrees...the computer would see that electrical pattern in the brain and turn the plane 090 degrees. If the pilot misheard instructions to turn 090 degrees and was thinking "080 degrees," the helmet would detect the error, then inject the right number via electromagnetic waves."

Yes in US, but classified. Lobster Magazine, *Mind Control and the American Government* by Martin Cannon, Number 23. J.F. Schapitz was conducting classified work on microwaving the subconscious with commands as in hypnosis. This work is classified.

Military interest or funding

4. Yes, Defense News, *US Explores Russian Mind Control Technology* by Barbara Opall January, 11-17-1993, p. 4. "Moreover, decades of research and investment of untold millions of rubles in the process of psycho-correction has produced the ability to alter behavior on willing and unwilling subjects, the experts add. ...Russian senior research scientist, diplomats, ...are beginning to provide limited demonstrations for their U.S. counterparts. Further evaluations of key technologies in the United States are being planned, as are discussions aimed at creating a frame-work for bringing the issue under bilateral or multilateral controls, U.S. and Russian sources say."

Symptom

5. Manipulation of emotions

Scientifically proven

5. Yes. Ultrascience, *Weapons of War*, Learning Channel, 1997, Featured Dr. Michael Persinger, Laurentian University, Canada. Dr. Persinger described weapons using "psycho or influence technology" and electromagnetic radiation frequencies to control what people think, for psychological warfare purposes.

Ultrascience, *War 2020*, Beyond Productions, Learning Channel, 1998, Dr. Michael Persinger, Laurentian University performed a demonstration of a helmet with solenoids which induce magnetic fields into the brain and cause panic, fear, God and UFO experiences. He stated that with current technology it is possible to use mind control on the mass populations.

Military interest or funding

5. Yes. See above.

Symptom

6. Reading thoughts remotely

Scientifically proven

6. No, but famous neuroscientist warns that remote neural monitoring equipment is "far from being science fiction" and can be used for "control of behaviour and brainwashing" and ...will become commonplace and capable of being used at a distance."

Nature/Vol 391/22Januray 1998

Advances in neuroscience 'may threaten human rights

By Declan Butler

...at the annual public meeting of the French national bioethics committee held last week in Paris... Jean-Pierre Changeux, the chairman of the committee and a neuroscientist at the Institut Pasteur in Paris, told the meeting that understanding the working of the human brain is likely to become one of the most ambitious and rich disciplines of the future. But neuroscience also poses potential risks, he said, arguing that advances in cerebral imaging make the scope for invasion of privacy immense. Although the equipment needed is still highly specialized, it will become commonplace and capable of being used at a distance, he predicted. That will open the way for abuses such as invasion of personal liberty, control of behaviour and brainwashing. These are far from being science-fiction concerns, said Changeux, and constitute "a serious risk to society". "Denis LeBihan, a researcher at the French Atomic Energy Commission, told the meeting that the use of imaging techniques has reached the stage where "we can almost read people's thoughts".

6. Yes. In the article, *Decoding Minds*, *Signal Magazine*, October, 2001, Dr. John D. Norseen, of Lockheed Martin stated , "We are at the point where this database has been developed enough that we can use a

single electrode or something like an airport security system where there is a dome above our head to get enough information that we can know the number you're thinking," According to *US News and World Report*

U.S News and World Report, Jan 3-10, 2000, *John Norseen, Reading your mind and injecting smart thoughts* by Douglas Pasternak, p. 67 "...Norseen's theories are grounded in current science."

The Washington Times, August 17, 2002, the article entitled *NASA plans to read terrorist's minds at airport* stated,

Airport security screeners may soon try to read the minds of travelers to identify terrorists. Officials of the National Aeronautics and Space Administration have told Northwest Airlines security specialists that the agency is developing brain-monitoring devices in cooperation with a commercial firm, which it did not identify. Space technology would be adapted to receive and analyze brain-wave and heartbeat patterns, then feed that data into computerized programs 'to detect passengers who potentially might pose a threat,' according to briefing documents obtained by The Washington Times. NASA wants to use 'noninvasive neuro-electric sensors,' imbedded in gates, to collect tiny electric signals that all brains and hearts transmit. Computers would apply statistical algorithms to correlate physiologic patterns with computerized data on travel routines, criminal background and credit information from 'hundreds to thousands of data sources,' NASA documents say. ...Robert Park, spokesman for the American Physical Society stated, 'We're close to the point where they can tell to an extent what you're thinking about by which part of the brain is activated, which is close to reading your mind. ...The idea is plausible, he says, but frightening'.

Here are a few examples of the advanced state of technology. Science Digest 7-84 page 30 stated Thomas Jensen, of Chicago's Rush-Presbyterian St. Luke's Medical Center, and Donald York "have discovered that just before a person says a particular word, the brain emits waves peculiar to that word alone. ...These waves are the same from person to person."

Dr. Richard Clark at the Flinders University of South Australia wrote the following in Think, Sept/Oct 92. Artificial neural network computer programs are used "to include the ability to learn and recognize simple patterns of thought from the electrical fields of the brain."

Science Digest 10-81 entitled *Machines that read Minds* by Gary Selden stated that "Indeed, CIA spokespeople have admitted 'following' ERP[This is the waveform that the brain characteristically emits after absorbing an external event] research, perhaps the way the agency followed LSD research in the 1950s. ...With remote monitors, such an instrument would be a spy's dream." It is naive to think that the CIA has not exploited this research.

In Nature, 1-22-98 Denis Le Bihan, a researcher at the French Atomic Energy Commission, he stated "we can almost read people's thoughts". The national bioethics committee is taking such threats so seriously that it is launching a study. The title of this article was *Advances in neuroscience may threaten human rights*.

Even in the unclassified sector, new technology includes surveillance for 'abnormal behavior' in order to alert security personnel of criminal behavior such as a car break in.. New Scientist, 12-11-99 Vol. 164, No. 2216 page 25 by Graham-Rowe, Duncan, described the technology as a computer programmed under the notion that most people behave in predictable ways when walking to their car. This behavior is transferred into a mathematical pattern and the computer recognizes it as such. "Anyone who deviates from this set pattern, such as someone who walks in circles or who lurks in shadows, will set off an alarm..." This is just a small example of human behavior and how it is studied scientifically. No doubt with the political will and the money of national security defense, as victims are alleging, human behavior has been studied and is controlled by government technology.

Military interest or funding

6. Yes, government funded. U.S News and World Report, Jan 3-10, 2000, *John Norseen, Reading your mind and injecting smart thoughts* by Douglas Pasternak, p. 67 "...It sounds crazy, but Uncle Sam is listening. the National Aeronautics and Space Administration, The Defense Advanced Research Projects Agency, and the Army's National Ground Intelligence Center have all awarded small basic research contracts to Norseen, who works for Lockheed-Martin's Intelligent Systems Division. Norseen is waiting to hear if the second stage of these contracts -portions of them classified-come through.

Symptom

7. Causing pain to any nerve of the body

Scientifically proven

7. Bulletin of Atomic Scientist, Sept 1994, *Softkill Fallacy* by Steve Aftergood, Page 45. Barbara Hatch Rosenberg writes: "Many of the non-lethal weapons under consideration utilize infrasound or electromagnetic energy (including lasers, microwave or radio-frequency radiation, or visible light pulsed at brain-wave frequency) for their effects. These weapons are said to cause temporary or permanent blinding, interference with mental processes, modification of behavior and emotional response, seizures, severe pain, dizziness, nausea and diarrhea, or disruption of internal organ functions in various other ways.

Numerous other articles on nonlethal weapons, see CAHRA [now Mind Justice] website: mindjustice.org [updated 2-04]

The People Zapper, heating weapon, demonstrated by military. Other technology very heavily discussed since the 1990s. See Marine Corps Times, *The People Zapper*, C. Mark Brinkley, March 5, 2001, p. 10. "...focuses energy into a beam of micromillimeter waves designed to stop an individual in his tracks. ...The energy, which falls near microwaves on the electromagnetic spectrum, causes moisture in a person's skin to heat up rapidly, creating a burning sensation..."

Military Interest or funding

7. Yes, government funding and very heavily discussed.

Symptom

8. Remote manipulation of human behavior from space

Scientifically proven

8. Yes. Dodge, Glaser, *Radiation Bioeffects Research*, Journal of Microwave Power, 12(4) 1977, p. 320. "The information explosion in this field has been quite dramatic since 1969, when the international data base was estimated to consist of less than 1,000 citations. In addition to maintaining inventories of the literature, we have undertaken from time to time to provide assessments of international trends in research, development, and occupational health and safety. In the present paper, we will concentrate on events which have transpired since our last review effort in 1975. Major events which have taken place during that period include: ... (5) Unpublished analyses of microwave bioeffects literature which were disseminated to Congress and to other officials arguing the case for remote control of human behavior by radar;

Psychotronic Arms Potential Must be Monitored, Member of the Russian Federation of Space Exploration Scientific and Technical Council, Anatoliy Pushenko in Moscow Rabochaya Tribuna, Nov. 26, 1994, FBIS, Ref # MM3011130594 "A prominent specialist speaks for the first time in our press in Rabochaya Tribuna about psychotropic weapons, which started to be developed in the sixties--space-based energy systems capable of killing every living thing on the planet and driving millions of people crazy. ... There are frequencies that are beneficial to people. But naturally there are also those which are hazardous. ... That is, it has a direct physical effect on the human brain. ... The terrible danger of psychotropic weapons is the possibility of their simultaneously and unequivocally affecting large masses of people over huge areas.

Moscow Armeyskiy Sbornik, *Russia: National Information Security* by Russian Major General, Valeriy Menshikov, doctor of technical sciences, and Colonel Boris Rodionov., Oct. 96, No. 10. P. 88-98, FBIS, Russian article, Mori DocID: 587170 "...Thus, the new space systems are potentially dangerous from the aspect of unfolding a wide-scale 'information war' and even creating global systems for controlling people's behavior in any region, ..." Also, scientists, weapons experts, EU members on U.S HAARP Project, FBIS article by Alain Gossens: *Apocalypse Now?* HAARP... report from Brussels Telemoustique, 1997, FBIS MoriDocID 587140, "Are the Americans currently developing a vast weapons system capable of scanning the entrails of the earth to seek out secret bases, jamming any form of radio communications, influencing human behavior... Nevertheless, if one is aware of the fact that the real sponsors are the Navy, the Air force, and the Department of Defense, then it is hard to believe that it is not a project for military purposes."

Military interest or funding

8. Probably. But scientifically sound. See tracking of airplanes, tracking by GPS. Satellites capable of taking pictures of license plates, etc.

Symptom

9. Harassment, stress symptoms such as helicopters flying overhead

Scientifically proven

9. Yes. Shukman, David. *The sorcerer's challenge : fears and hopes for the weapons of the next millennium*, London : Hodder & Stoughton, 1995, P. 225 "The best they [FBI] they could do was to maintain a barrage of noise with helicopters and loudspeakers to keep the followers awake and to try to undermine their [Koresh and follower's] morale."

This quote is from Aviation Week & Space Technology 1-19-98 p.55 on information warfare and US capabilities. "...techniques as esoteric as 'mapping the psychological and cognitive makeup' of foreign leaders or key groups in order to predict reactions to manipulated information, ..." . And the follow up story, on 3-9-98, page 21 stated that [USAF Gen. John] "Jumper talked about tools that could...make potential enemies see, hear and believe things that don't exist" The military is discussing the deployment of weapons to do just that, create symptoms of mental illness. And yet this information is not taken seriously by professionals and has not been accepted as relevant to victim's allegations.

Excerpts from CAHRA [now Mind Justice] website military journals and government document quotes: "...to control the will and perception of adversaries ...by applying a regime of shock and awe...It is about effecting behavior." "A decoy and deception concept [using microwaves] to 'create intelligible speech ' in the head, 'raising the possibility of covert suggestion and psychological direction." "tools that could...make potential enemies see, hear and believe things that don't exist." "...crowd control and urban warfare devices that temporarily could paralyze an entire village."

Military interest and funding

9. Yes. See above.

Symptom

10. Seeing, as in a camera, through your eyes, i.e. to see what you see exactly

Scientifically proven

10. Proven in animals. BBC News Online Oct 11, 1999, *Looking Through Cats' Eyes Fuzzy But Recognizable*, Dr. David Whitehouse, http://news.bbc.co.uk/hi/english/sci/tech/newsid_471000/471786.stm A BBC News article reported on the first pictures from an experiment to see through the eyes of a cat.

Military interest and feasibility

10. No.

Symptom

11. Control of sleep patterns

Scientifically proven

11. Proven on animals. # CNN news broadcast, Special Assignment, Nov.-1985, by Chuck DeCaro, *Weapons of War, Is there an RF Gap?* Dr. Ross Adey discussed a demonstration of the 1950s Russian Lida machine, which used electromagnetic energy to put Russian psychiatric patients to sleep, as a substitute for tranquilizers and to treat neurotic disturbances. Dr. Adey stated that it worked on cats and dogs and put them to sleep. The Defense and Foreign Affairs Daily, Jun 7, 1983, Vol. XII, Number 104, *Psy-War: Soviet*

Device Experiment by Dr. Stefan T. Possony reported: "...Dr. Ross Adey, chief of research at Loma Linda...started testing the machine [the Lida]...the device is on loan to Dr. Ross Adey. 'The machine is technically described as 'a distant pulse treatment apparatus. It generates 40 megahertz radiowaves which stimulate the brain's electromagnetic activity at substantially lower frequencies"

Military interest or funding

11. Yes. . The Defense and Foreign Affairs Daily, Jun 7, 1983, Vol. XII, Number 104, *Psy-War: Soviet Device Experiment* by Dr. Stefan T. Possony. "...On April 29, 1983 this author, as a participant in a panel at the Defense '83 conference sponsored by Defense and Foreign Affairs, reported on Dr. Adey's work...These remarks were delivered to a panel studying psychological warfare."

Symptom

Scientifically feasible

12. Yes. APPROPRIATION/BUDGET ACTIVITY RDT&E, Defense-wide BA2 Applied Research R-1 ITEM NOMENCLATURE Computing Systems and Communications Technology PE 0602301E, Project ST-19 The Augmented Cognition (AugCog) program will develop the means to measure a subject's cognitive state in real time and manipulate it to accomplish the functions. The goal of the Augmented Cognition program is to develop methods that integrate digital devices that support memory, perception, and thinking, and link that support with the user's context state information to directly improve the overall cognitive performance of the warfighter. The Perceptual Processing Display program focuses on exploiting neuroscience and perceptual processing technologies to redesign devices that deliver information to the human perceptual system. These new devices will be able to extract relevant signal from extraneous background noise, through perceptual modeling. This program will develop technologies that simplify relevant, and eliminate irrelevant, information to improve perception, comprehension, memory, inference, and decision-making. Specifically, this program will demonstrate the manipulation of perceptual data along hundreds of dimensions of the human perceptual system, and will result in the doubling of human information processing performance. <http://www.darpa.mil/body/pdf/FY03BudEst.pdf>

Symptom

13. Complex control of the brain such as retrieving memories, implanting personalities

Scientifically feasible

13. Yes. *2002 Converging Technologies for Improving Human Performance*, A National Science Foundation /U.S. Department of Commerce-sponsored report. Here are relevant excerpts. Full text at http://itri.loyola.edu/ConvergingTechnologies/Report/NBIC_pre_publication.pdf List of Participants and Contributors included NASA, Office of Naval Research, DARPA, Sandia National Labs, USAF Research Labs, Ratheon, Lucent Technologies, MIT and Stanford.2. Expanding Human Cognition and Communication. Page 85. "...Truly, the mind is the final frontier, and unraveling its mysteries will have tremendous practical benefits. ...Failure to invest in the necessary multidisciplinary research would delay or even prevent these benefits to the economy, to national security, and to individual well-being. Rapid recent progress in cognitive science and related fields has brought us to the point where we could achieve several breakthroughs that would be of great value to mankind. ...For example, progress in the cognitive neuroscience of the human brain has been achieved through new research methodologies, based in both biology and information science, such as functional magnetic resonance imaging (fMRI) and infrared sensors. However, we are reaching the resolution limits of current instrumentation, for example because of concerns about the safety of human research subjects (Food and Drug Administration 1998), so progress will stall quickly unless breakthroughs in NBIC can give us research tools with much greater resolution, sensitivity, and capacity to analyze data."

3. Page 86. **The Human Cognome Project.** "It is time to launch a Human Cognome Project,

comparable to the successful Human Genome Project, to chart the structure and functions of the human mind. No project would be more fundamental to progress throughout science and engineering, or would require a more complete unification of NBIC sciences. ...While the research would include a complete mapping of the connections in the human brain, it would be far more extensive than neuroscience. ...Some participants in the human cognition and communication working group were impressed by the long-term potential for uploading aspects of individual personality to computers and robots, thereby expanding the scope of human experience, action, and longevity."

4. Page 88. "Statements and Visions. Participants in the human cognition and communication panel contributed a number of statements, describing the current situation and suggesting strategies for building upon it, as well as transformative visions of what could be accomplished in ten or twenty years through a concentrated effort."

5. National Security, Theme Summary. Page 287. "...Investment in convergent nanotechnology, biotechnology, information technology and cognitive science [NBIC] is expected to result in innovative technologies that revolutionize many domains of conflict and peacekeeping. ...As former Defense Secretary William J. Perry has noted, these are the technological breakthroughs that are "Changing the face of war and how we prepare for war." There are numerous special programs, reports and presentations that address these goals. The Department of Defense has designated nanoscience as a strategic research area in order to accelerate the expected benefits (Murday 1999). ...**Applications of brain-machine interface. The convergence of all four NBIC fields will give warfighters the ability to control complex entities by sending control actions prior to thoughts (cognition) being fully formed. The intent is to take brain signals (nanotechnology for augmented sensitivity and nonintrusive signal detection) and use them in a control strategy (information technology), and then impart back into the brain the sensations of feedback signals (biotechnology).**"

In *Approaching the 21st Century: Opportunities for NIMH Neuroscience Research* The National Advisory Mental Health Council Report to Congress on the Decade of the Brain, Jan. 1988 by USHHS. Page 49 stated "Several investigators had noted that when neurons were given brief but intense high-frequency stimulation their electrical properties were changed in ways that would fit those proposed for memory: The changes were triggered by an electrical event, they were strengthened by repetition, and they persisted indefinitely. ...the scientists found that intense high-frequency pulses trigger an unusually large release of calcium in the post synaptic cell..."

Public Testimony

Ms. Casagrande: Thank you for having me today. You should all have a booklet that looks like this. I am here as a representative of victims of telebiostimulation and control resource, but we call it research. If you could turn to page --there is a definition just below for you who aren't familiar with the term. Telebiostimulation and control is the manipulation of biological processes by the use of --

Dr. Shapiro: Excuse me a moment. I really want you to wait until we can really hear properly to give you an opportunity. It's still not working. It's still not working well.

Dr. Shapiro: If you would like, perhaps, to sit on the corner here. You just use that and you just sit in the chair there.

Ms. Casagrande: Here at this one?

Dr. Shapiro: Either one would be fine.

Ms. Casagrande: Is this better?

Dr. Shapiro: Thank you very much.

Ms. Casagrande: Oh, no problem. I am here as a representative of victims of telebiostimulation and control. If you'll turn your page, I have a definition just for those of you who aren't familiar with the technology, and what it's all about. Telebiostimulation and control is the manipulation of biological processes by the use of telemetry. This technology tapped into the networks of research or targeted living organisms and input signals into the organisms neuronetworks. Telebiostimulation and control were used in neural networks where the brain goes beyond simply recording thoughts as they are processed within the mind. Instead, technology is capable of placing thoughts, feelings, sounds directly into the mind and relaying signals to muscles, making them contract and/or release. A little bit about myself. I am an engineer. I have a masters degree. I have worked for one of the Big Three in Detroit. This technology is being used on myself, and subsequently I have lost a lot of my life. I am now working again. I'm a senior engineer for a small firm and trying to regain my life. And I'm here today to explain the technology and try to add credibility to what's going on out there. The next page is a listing of nonprofit organizations that are either existing or becoming existing, not something most mental patients usually do. We are forming. We are gathering together, and we will be a viable force if we have anything to do with it. The next couple of pages just give you references to those two other organizations. The next page, victims; very nontechnical, but this is what we have. This is how we document what's going on out there. Many victims receive audio communication, which is placed directly into the brain's neural network. As an example of this technology, the sound of a bird singing outside your living room window can be duplicated exactly when you're sitting down in a cave 200 feet below ground

level. Victims are frequently subjected to sleep deprivation and dream control. Sleep only occurs when and for the duration determined by the controlling party. Also, a victim could be shaken with panic one minute, and may be asleep like a baby the next. It's that fast. This isn't something that happens in mental patients. It's like that. They control it totally. Muscles can be twitched or contracted, either lightly, or violently. If not to complicate matters, these effects can be placed into the brain as a sensation, meaning that the muscles felt like a twitch, but it's not really. And as a victim it's just one of the many things we go through. Victims have felt cold on an 80 degree day, and we have felt warm standing out in snow in shorts. It overrides everything you actually feel, and makes you feel what they want you to feel. As mentioned earlier, this is a scary party because you can ignore the victims but this is how it effects everyone. Thoughts can be placed unnoticed into the human mind. Also, current thoughts and past experiences can be read from the brains memory banks, and victims are often subjected to memory blockage, and to the retrieval or at the discretion of a controlling party. I realize this is a lot to say, and it's scary. But I'm here today to try and get through, and it needs to be dealt with. It's been covert. It's been under the rug. It's time. It's getting scary. It's going to take a lot of people. And the next page. This is to show you that this is believable. This isn't fiction. Walter Hess, back in the early 1920's to 1940's, started working with electrodes within the brain, not just on the surface. He was able -- and this is in a book that anyone can get from the library. I went to my library and pulled it out. "A cat's sudden changes in behavior startled him. The tiny surge of electricity in the cat's hypothalamus, a part of the limbic system, turned the gentle animal into a ferocious beast." Hess discovered he could also control the animal's heartbeat and breathing. He was controlling an animal's heartbeat and breathing in 1940. He won a Nobel prize for this technology in 1940. Unbelievable? It's written, it's documented. José Delegro -- Delgado -- I said his name right. Another scientist came along. He took up where he left out. He did the exact same thing, but by use of telemetry. Wires were not needed. He implanted, used implants. Started in 1950, he was doing this research. Suddenly, we have a break. We don't hear much anymore. Did somebody drop the ball? We're not looking into the mind? I don't think so. It's when an undercover CIA got into it. If you've heard of NK-ultra. It's not talked about. This telebiostimulation has been talked about. Usually, you hear about different things that the CIA tried to do next. I don't have a lot of answers. I just know what's going on. Next page. This is something that we have researched and found. The review of magnetic neurosurgery research. And over here more than 30 years ago investigators using magnetic fields to navigate clinical implants through neurovascular systems. It really ties in implants 30 years go. And now with the advent --and then you have to flip quite a few pages. With the advent of computers, the talking nanochips. If you're --I'm in the engineering field, so I'm very familiar with nano, microscopic. And you're talking computers, microscopic implants. Who knows? We think about as a victims group, we try to get imaging. We even wonder if that would help. Also, we're trying to work with anechoic chambers, trying to see if we are generating a signal. We must be generating signals. Obviously, we are receiving signals from somewhere else. It's hard to get someone to believe you. In groups we seem to fare better. But, again, it's the researchers, what they do first is get us flat-on-our-back broke, and then we scrounge up from there trying to recover what we had. Families often try to put us in mental facilities. You just spend your lifetime -- you spend quite a few years trying to recover. And to be honest, you only recover if they allow you --you wander. Again, the next page is just more proof of how much we know about the human mind. Here is the mapping. This is a mapping photo, but yet they don't seem to ever talk about thought, think you may have thoughts.

Dr. Shapiro: I'm sorry to interrupt, but you have to draw your comments to a close. We're over five minutes.

Ms. Casagrande: Okay.

Dr. Shapiro: If you could draw your comments to a close.

Ms. Casagrande: Outcome, I just know victims, present victims, we hear a lot from those from 1950's, 1970's. They have actual implants that they found in the '60's and '70's, which is believable. We are not finding many implants in ourselves, also believable. Another one is a letter in there from an actual official in New York, who said that we -- that she believes that she admits that the technology is out there, but yet it's classified and she can't discuss it. This is the most interesting thing I have is from the French National Bioethics Committee. I won't read over that, but maybe you've heard about it. They are starting to look into this, because of imaging technology. They're saying it can read thoughts, and it's possible to read thoughts and I would like you to do the same. The last page may be a little blunt. As victims, we get very frustrated. I apologize for those of you who don't even know what I'm talking about. For those of you who do, please we need your help. I don't have -- I guess that was it. I have a bunch of just listings of names and some pictures of what's going on out there.

Dr. Shapiro: Thank you very much, and thank you for the effort of putting the material together.

Ms. Casagrande: Thank you for listening to me.

Secrecy and Government Bulletin

[Steven Aftergood writes about the first organization for microwave targeting -- Julianne McKinney of the Association of National Security Alumni -- no longer in existence]

Non-Lethal Weapons

Secrecy is obstructing public awareness and discussion of the emerging field of so-called "non-lethal weaponry," a development that may have profound and possibly alarming implications for military strategy, law enforcement, and civil liberties.

Non-lethal weapons refer to systems that damage or disable enemy personnel or equipment, but stop short of killing people. For example, the non-lethal category would include technologies that incapacitate enemy forces by temporarily blinding or disorienting them, making them violently ill or putting them to sleep. "According to Army officials, at least seven non-lethal munitions programs are being pursued by service and national research facilities," including the Army's Harry Diamond Laboratories and Los Alamos National Laboratory (National Defense, October 1993,p.25). In addition, there are persistent reports of non-lethal weapons programs conducted on an unacknowledged, special access basis.

Janet Morris of the U.S. Global Strategy Council, a proponent of non-lethal weapons, believes that "We can better serve our national interests at home and abroad by projecting power without indiscriminately taking lives or destroying property." In a recent position paper, she has identified some two dozen non-lethal weapons anti-personnel and anti-materiel technologies and called for the development of a national non-lethal policy and strategy to promote and guide their development.

But the articulation of such a policy, including its proper limitations, has been stymied, she says, by the rigorous secrecy imposed on the subject.

In many cases, the non-lethal approach merely involved minor modifications in existing weapons systems or in the manner in which they are used. On the other hand, in some of its more exotic variants, non-lethal weaponry includes behavior modification systems and even mind control devices.

Subtle influences of auditory and other stimuli on mental processes have long been recognized but are not well understood. "I also know," St. Augustine wrote, "that there are particular modes in song and in the voice, corresponding to my various emotions and able to stimulate them because of some mysterious relationship between the two." (Confessions [unreadable])...

"The Russian capability, demonstrated in a series of laboratory experiments dating back to the mid-1970s, could be used to suppress riots, control dissidents, demoralize or disable opposing forces and enhance the performance of friendly special operations teams, sources say (Defense News, January 11-17, 1993, page 4).

A preliminary report by Julianne McKinney of the Association of National Security Alumni on "Microwave Harassment & Mind-Control Experimentation" surveys the field and presents anecdotal accounts of alleged harassment. Since allegations of government harassment and mind control are also associated with some

forms of mental disorder, these accounts are difficult to evaluate.

In any case, the potential for abuse of such research is self-evident. Yet there has been little or no discussion of the proper parameters for research, let alone application, because of the government's aggressive classification of the field. As so often seems to be the case, Congressional attention has been deflected by the secrecy surrounding the programs already underway in government laboratories. Meanwhile, even advocates like Morris are distressed by the degree of secrecy, which they believe is unwarranted and counter-productive.

The American Defense Preparedness Association will hold a symposium on Non-lethal Defense at John Hopkins University on November 16-17. Topics for discussion include emerging technologies and "adoption and assimilation of these systems into the force structure." The conference is classified Secret.

Letter from the Association of National Security Alumni to Cheryl Welsh

[Addresses removed]

**Association of National Security Alumni
Electronic Surveillance Project**

September 10, 1993

Ms. Cheryl Welsh

Dear Cheryl:

Again, my apologies for the delay in getting this out to you. Being a one-person Project, with a wide variety of commitments and obligations, I simply have not had the time to be able to respond to incoming correspondence with any degree of speed and dispatch.

Dear Cheryl:

Again, my apologies for the delay in getting this out to you. Being a one-person Project, with a wide variety of commitments and obligations, I simply have not had the time to be able to respond to incoming correspondence with any degree of speed and dispatch.

Be that as it may, I would like to thank you for your \$50.00 contribution. In turn, I am enclosing a copy of Microwave Harassment and Mind-Control Experimentation, along with copies of a number of published articles and items of correspondence which are directly germane.

Having read through your file, I am struck by the similarity between what has been going on in your case and in numerous others (my own included).

I mentioned to you the case of the woman in Nashville who has been recording conversations overheard in a local restaurant, in the expectation that those tapes can be used as evidence of conspiracy in a court of law. Her case involves the "tooting of car horns," the "wailing of sirens," and the tauntings of neighbors, in direct response to her expressed and unexpressed thoughts. Until approximately 1989, she was a regional sales manager. She is now unemployed, occasionally homeless, and otherwise living with her mother, whom she regards as a "government facilitator" in these mind control operations.

"Noise campaigns" are a standard part of these mind-control experiments. In your case you appear to have been regarded as ideally suited for a prolongation of this facet of the experimentation, perhaps because of your strong emotional response, ...

The last I heard, you were looking for evidence to support your belief that environments are manipulated for individual mind-control/harassment purposes. What you might want to do, if this remains an area of primary concern to you, is dig up anything and everything on Operations MHCHAOS and COINTELPRO--CIA and FBI operations used ultimately against Vietnam War protestors. You might also want to look into tactics employed by the government during the red-baiting days of Joe McCarthy. All sorts of "dirty tricks" were played on U.S. citizens during these respective eras, some of which could conceivably qualify as "manipulation of the environment."

You might also want to get your hands on some of the books now being sold by publishers specializing in militaria; i.e., which specifically concern "dirty tricks." You may also want to contact some survivors of government harassment during the Vietnam Era, some of whom filed suit against the government. Jane Fonda was one of the more renowned.

I hope that this information will be of some assistance. Again, good luck.

Sincerely,

Julianne McKinney
Director,
Electronic Surveillance Project

Man held in attempt to mail Clinton a bomb

by Joseph A. Slobodzian
Philadelphia Inquirer Staff Writer

January 8, 1997, B2

A North Philadelphia man who authorities say made a series of threats against public officials last year has been charged with mailing a "Molotov cocktail" to President Clinton.

Joseph Washington, 31, of the 1300 block of Ridge Avenue, was charged Monday with mailing an explosive device after postal officials X-rayed a padded envelope he mailed to the White House on Thursday at the Fairmount branch and allegedly discovered a plastic bottle filled with kerosene or lighter fluid. The device never detonated.

Assistant U.S. Attorney Mary E. Crawley said she could not comment on where Washington was being held.

A federal law enforcement official said, however, that authorities agreed not to take Washington into custody after he voluntarily admitted himself into a psychiatric facility.

According to an affidavit by Richard Weber, an agent with the Federal Bureau of Alcohol, Tobacco and Firearms, Washington's envelope never left the Fairmount postal branch, at 900 N. 19th St.

When postal officials at the Fairmount branch saw that the bulky envelope was addressed to the White House and Clinton, the affidavit says, they ordered it examined.

The X-ray of the 10 1/4-by-9 1/4-inch yellow envelope showed the plastic bottle, the affidavit says. The bottle was about three-fourths full of a liquid and had a homemade wick attached to the cap. Some of the liquid had leaked out of the bottle and saturated a two-page letter addressed to the President.

According to the affidavit, the letter tells Clinton to "tell the Philadelphia Naval Base to stop trying to brainwash me into killing people with covert E.L.F. electronic weaponry" and asks for "compensation for being a research test victims."

The letter warns that if Clinton failed to act, Washington would "start killing political people," the affidavit says. The letter threatens the lives of the President, Hillary Rodham Clinton and the Clintons' daughter, Chelsea according to the affidavit.

Dan Rather Identifies Attacker

Wednesday January 29th 6:46 AM EST

Dan Rather Identifies Attacker

By Newsradio 88 Staff

It took ten years, but finally we find out about the bizarre attack on CBS Newsman Dan Rather on Park Avenue.

Rather says he now knows who mugged him and muttered the notorious line, "What's the frequency, Kenneth?" back in 1986.

He tells the Daily News he's learned who it is from a psychiatrist who examined the suspect after the fatal shooting of an NBC technician outside the Today show studios in 1994. That psychiatrist, says Rather, says there's no question it was the same man--49-year old William Tager.

Tager is in prison after pleading guilty to first-degree manslaughter.

When he mugged Rather, he apparently was demanding the frequency used to transmit hostile messages he was convinced the news media were beaming into his head.

by Newsradio 88 Staff

It took ten years, but finally we find out about the bizarre attack on CBS Newsman Dan Rather on Park Avenue.

Rather says he now knows who mugged him and muttered the notorious line, "What's the frequency, Kenneth?" back in 1986.

He tells the Daily News he's learned who it is from a psychiatrist who examined the suspect after the fatal shooting of an NBC technician outside the Today show studios in 1994. That psychiatrist, says Rather, says there's no question it was the same man--49-year old William Tager.

Tager is in prison after pleading guilty to first-degree manslaughter.

When he mugged Rather, he apparently was demanding the frequency used to transmit hostile messages he was convinced the news media were beaming into his head.

Note, according to YAHOO: R.E.M. singer Michael Stipe, who said of the Dan Rather incident, "It remains the premier unsolved surrealist act of the 20th Century. It's a misunderstanding that was scarily random, media hyped and just plain bizarre. The attack inspired the 1994 R.E.M. hit "What's the Frequency, Kenneth." Being a good sport, Dan Rather even accompanied the band when they performed the song on a Late Show with David Letterman. According to the psychiatrist, Tager thought if he could just find out the correct frequency, he could block those signals that were constantly assailing him. Hence the enigmatic

inquiry.

Hong Kong professor sues U.S. for mind control

NOTE: Another allegation of mind control. With a closer look, mental illness can be ruled out.

The South China Morning Post reported on Jan. 25 that an assistant professor at the University of Science & Technology, Hong Kong, has filed a \$100 million suit against the U.S. government for implanting mind-control devices in his teeth. Huang Si-ming charges that the devices were implanted during root canal work in 1991 while he was studying at the University of Iowa, according to Morning Post reporter Patricia Young. Another student at Iowa U who, like Huang, was born in China, had gone on a shooting spree, and the feds, Huang says, put the devices in his teeth to find out if he was involved.

The Hong Kong professor says he suffered an Alzheimer's disease-like memory loss that hampered his teaching. It stopped, he says, only when he sought legal aid to mount his lawsuit. Besides the U.S., the suit names the University of Science & Technology on the grounds that it was involved in continuing the mind-control work. It also seeks punitive damages of \$1 million from the defendants for "low ethical standards."

Huang claims that one of the devices in his teeth can read his thoughts and talk to his mind when he's asleep. A second device, he believes, transmits pictures of what he sees to a receiver for recording. The mind controller, he says, can drive him to "bad" behavior, he gives two examples, one of which cannot be mentioned in a family magazine.

Neither the university nor the U.S. Consulate in Hong Kong would comment on the suit, according to reporter Young.

Doctors investigating claims of Greenham radiation cases

Peace women fear electronic zapping at base

Peace women fear electronic zapping at base

By Gareth Parry

secret electronic signals
satellite communications

The Guardian

Monday March 10 1986

By Gareth Parry

Doctors are compiling a report on the condition of a number of Greenham Common peace women who have had symptoms which are consistent with the known neurophysiological effects of electromagnetic waves, or

low level radiation.

These symptoms range from headache and dizziness to difficulties of concentration or memory. Fears of electronic "zapping" have led peace women at the camp to keep a record of ill-effects reported by their groups over the past year.

Claims that this has revealed a pattern of illness will be presented by the peacewomen at a media briefing in London today. They will report that at least 40 women present at different points around the nine-mile perimeter of the American cruise missile base have experienced similar symptoms, at the same times.

Dr. Stephen farrow, chairman of the Medical Campaign Against Nuclear weapons said yesterday: "We are now compiling evidence about the claims made by the women. There is obviously a great deal of interest in what they say; it seem feasible, although a lot of it is anecdotal, and we're very thin on evidence."

Dr. farrow, who is senior lecturer in epidemiology at the University College of Wales Medical College said that academic research into similar claims was being conducted in Canada.

The symptoms could be related to the powerful and secret electronic microwave satellite communications apparatus used at the missile base. If this is so, it would indicate unhealthy emissions are being radiated into the Berkshire countryside.

On the other hand the American military have an intruder detection system called BISS, Base Installation Security system which operates on a sufficiently high frequency to bounce radar waves off a human body moving in the vicinity of a perimeter fence.

A similar British system has been developed and has been acquired by the Ministry of Defence since April, 1984. Security at Greenham is a British responsibility but it is not known whether equipment of this type has been installed.

Some Greenham women believe that the symptoms are the result of an attempt to drive them away from their protest siege of the missile base.

Other peace women claim they are being assaulted by what the military calls electronic warfare, as part of a "field trial."

The Greenham women claim that meter tests outside camp, taken at times when women have experienced the symptoms, have shown a marked increase in background microwave signal levels. they also say the symptoms are more pronounced when cruise missile convoys leave the camp.

The Ministry of Defence denies that any form of electronic signals are being use on the women.

Air Force Accused of "Zapping" Protesters

On Guard

Women peace campers at Greenham Common, England, claim that they are being attacked by the US electronic weapons from within the US airbase there. They believe that some form of electromagnetic wave or other signal is being directed at them and is responsible for a number of illnesses they have suffered over the past year.

Symptoms range from mild headaches and drowsiness to bouts of temporary paralysis and, in one case, an apparent circulatory failure which required emergency treatment. Women have also complained of sharp pains and problems with speech coordination. A team of doctors from the Medical Campaign Against nuclear Weapons are compiling a report on the condition of the women affected.

The women first noticed a pattern of illnesses emerging in 1984. They discounted food or water poisoning as a cause and started to suspect interference from inside the base. They found that women at different points around the camp appeared to have experienced similar symptoms at the same time, even when they were

not in contact with one another.

They believe there is a deliberate intent to make life difficult for them and so drive them away. Some of the worst affected women now find it impossible to stay around Greenham for more than a short period of time.

Electronic weapons are known to have been used by security forces on a number of occasions. The Americas are reported to have used ultrasound to disorient and demoralize their enemies during the Vietnam war and a number of American police forces are believed to have carried out trials with infra-sound generators mounted on the back of trucks. The high intensity, low frequency pressure waves these produce are said to cause vomiting, nausea and a range of other disturbances and to induce fits in those who are subject to them. American medical groups have protested against the proposed use of these weapons for urban riot control.

Microwave radiation is also believed to have been used as a weapon at various times. The most celebrated instance was the irradiation of the US Embassy in Moscow during the 1950s, '60s and '70s. It has never been made clear whether the Russians used the signal as a weapon or for surveillance, but a television documentary screened last year reported a high incidence of cancer amongst ex-Embassy staff and suggested that disorders of the blood and nervous system could also have been caused by the signal.

The women at Greenham Common suspect that more than one type of frequency of radiation is being used against them. They say that the symptoms vary from time to time and seem to reflect what takes place on the base. Large numbers of women have complained of sudden feelings of extreme tiredness shortly before major events, such as the departure of a cruise missile convoy and on other occasions when their activities might have proved particularly awkward for the forces using the base.

We have conducted a number of tests around the base in cooperation with journalists from other organizations. Readings taken with a wide range signal strength meter showed marked increases in the background signal level near one of the womens' camps at a time when they claimed to be experiencing ill effects.

On another occasion, previously low signal levels near the camp rose sharply when the women created a disturbance just outside the perimeter fence of the base. Whether this indicated an attempt to subdue the women by electronic means or merely the use of a radar surveillance system it is impossible to say.

The signal levels measured were well above normal background levels but still within official safety limits. however, there is evidence from a number of sources that low levels of electromagnetic radiation can have harmful effects especially where exposure takes place over a long period of time.

British Defense officials have denied that any form of electronic signal is being used against the protesters.

November/December 1998

Human Testing Lawsuit Dismissed...In September, a lawsuit brought by the International Committee on Offensive Microwave Weapons (ICOMW) was dismissed in the U.S. district court in Washington. "We were asking the court to enforce a presidential memorandum which bans involuntary research on human subjects," said the group's director, Harlan Girard. The Philadelphia-based organization had alleged that the

DOD and the CIA have conducted such experiments in their efforts to develop weapons systems using EMFs, lasers, microwaves and sound waves (see *MWV*, M/J98). The judge ruled that the group did not have standing to bring suit because the people alleged to have suffered from such testing were not ICOMW members. She acknowledged that Girard himself was a member, but stated that his own complaints were "too generalized and nonspecific to support a complaint." Girard told *Microwave News* that the ICOMW could not afford an appeal. Instead, he said, the committee plans to raise the matter with the Inter-American Commission on Human Rights. A new report from the Coalition Against Torture and Racial Discrimination, an alliance of 15 U.S. human rights groups, states that the lawsuit's charges deserve attention. "Given the past history of secret experimentation by the government," the anti-torture group declares, "these allegations of continuing...government-sponsored human testing should not be dismissed without more thorough, impartial investigation."

Woman fears government zapping

Sun Journal
New Bern, NC
September 28, 1992

By Janet Blackman
Sun Journal Staff

Mildred Cooper's world is different.

Electronic government weapons are zapping burns in her face and overhead power lines emit rays that stab her back and make her brain feel swollen. She says she gets zapped in her home, her car and even in church on Sunday mornings.

She admits to some age spots on her hands, but the other faded brown spots on her arms and face were caused by the electronic weapons being used the the Central Intelligence Agency or the Federal Bureau of Investigation, she says.

She does not know why she is a target.

Cooper, a 72-year-old grandmother, has lived in Trent Woods since 1989 after having moved from Richmond, Va. she has a gray Dodge in the driveway, neatly trimmed shrubs cut away from the picture window into her sitting room. She has keyed locks on all her windows and three keyed locks on each door.

She has three rooms filled with books and magazines about the CIA -- a magazine called *Microwave News*, published in New York for \$250 for six issues; newspaper clippings of a Cleveland, Ohio, woman who claims she killed her daughter with a 10-inch butcher knife after being zapped by a secret CIA mind controlling computer; "The Search for the Manchurian Candidate," a fictional novel by John Marks; "Maze" by Larry Collins, another fictional piece about the CIA using mind control tactics; and "Currents of Death" and "The Zapping of America" both by Paul Brodeur about the dangers of being exposed to certain types of electricity.

Cooper says the CIA and FBI have pursued her from Richmonds. She says she is allergic to electricity.

Cooper says she noticed things had changed in 1979 -- the year she was divorced from her husband and fired from her job of 37 years. That year she began having abnormal heart beats and headaches that made her brain feel swollen.

She says all the medical doctors she saw in Richmond told her nothing was wrong, other than hypoglycemia.

"That's what they all said," she says, "nothing's wrong."

In between doctor's visits in England, Sweden, Finland and Canada, she began feeling like she was being watched and listened to. But a private detective's search of her house turned up no listening devices, so she became convinced other methods of control were being used on her.

She moved south in 1989 after the pain in her back became too much to bear because Trent Woods has underground power lines encased in steel and Craven County was not as industrial as Richmond.

But she says the CIA and FBI followed her to the quiet neighborhood on the outskirts of New Bern, about 20 miles from the world's largest Marine Corps air station.

She thinks someone broke into her home in August 1989 by taking the molding and glass from her garage door, picked the lock she had installed on the door and then replaced the molding and glass.

She says whoever broke into her home took her files about secret government weapons, genealogy records she had spent years researching, a silver casserole dish and games her two children have played with when they were younger.

A self-described devout Christian, Cooper says she is sure the powers that are tormenting her are evil. She does not know why they are after her.

"This is not of God," she says. "Our government now is controlled, we don't know who it is controlled by. I think the CIA, the FBI and the military are evil.

"We don't have any physicians over here that I can ask" she says. "Now where would my sensitivity to electricity end and where would torture begin?"

She has been called paranoid when she would tell her story to the FBI in Richmond. She has tried to educate the public about the secret weapons and allergies by writing senators, newspapers and suing various branches of the government without any of her cases ever going to court.

"When you've been hit with...", Cooper says as she rubs a faded brown mark on her left cheek below the rim of her glasses. "You are paranoid. You are scared to death when you've been hit with electricity. It's like sticking your finger in a socket."

"The first question you ask when a person says I'm sensitive to electricity is, 'How do you know?' " Cooper says. "Well, I diagnosed it myself by process of elimination. When I'd go out in my back yard in Richmond and feel like I was being stabbed in my back. What is out there that could cause it?"

Cooper knows she is opening herself up to more harassment by telling her story. But she does not care so much about that, she says.

Humans used as guinea pigs

Sun Journal - Opinion

Sun Journal
New Bern, NC
Friday, October 2, 1992

Editor:

Referring to the article in the Sun Journal about my research in the field of non-ionizing electromagnetic radiation (NIER) ("Woman fears government zapping," Sept. 28), I wish to correct a few discrepancies.

There is much proof that the U.S. government has directed energy weapons and/or frequencies, and are using human beings as guinea pigs without their knowledge and without their permission. The CIA has also used hard drugs in its Mind Control program. "The Search for the 'Manchurian Candidate' " by John Marks is the story of how the CIA brought hard drugs into the U.S. and used them indiscriminately on whomever they chose -- at times even on other CIA agents. This book is not fiction; it is the story of the CIA and Mind Control. John Marks, the author, is a former Senate aide and former State Department official. The book, "The Manchurian Candidate," may be fic- [text lost in copy]

In June 1986, the book "Low Intensity Conflict and Modern Technology" was compiled by Lt. Col. David J. Dean, U.S. Air Force. This book is for sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C., for \$14. The chapter titled, "The Electromagnetic Spectrum in Low-Intensity Conflict" by Capt. Paul E. Tyler, MC, U.S. Navy, states on page 256, "With today's sophisticated weapon system, one does not have to totally disable individuals to render them ineffective for combat. For example, if their timing is altered or their cognitive processes are degraded these individuals may be unable to operate their equipment (fly their aircraft, make the proper decision with computer-operated systems, or successfully complete related action. ... A large part of this paper may read like Buck Rogers. ... Many readers will say that some of these ideas and concepts do not fit with their current concepts and theories of physics and biology. ... Most of the medical science I learned in medical school more than 25 years ago is not valid today." I want to emphasize that Capt. Tyler is a medical doctor in the U.S. Navy.

In listing the effects of electromagnetic radiation, Capt. Tyler states, "They are not exhaustive and do not include many of the effects reported in the Soviet and East European literature." (Capt. Tyler did not list the adverse effects). In other words, these adverse effects of NIER are "classified" in the U.S., because they come under the "Star Wars" program. This is not classified information in many other countries.

The major break-in at my home was on April 21, 1990, and not August as reported in the article.

I was not "fired" by Seaboard Coast Line Railroad. My position was abolished, as were those of about eight other women when we filed EEOC complaints against the company for sex discrimination. The terms of the settlement were negotiated, and when I was not offered a position comparable to the one I had, I reluctantly took early retirement. To abolish a position after a person files an EEOC complaint is a violation of federal law.

"Four Essays Leading to the Age of All Mankind"

February 16, 1999

Ms. Cheryl Welsh

...
U.S.A.

Dear Ms. Welsh,

Here I send my book with the compliments of the author. The direct translation of the title is "Impeaching the misuses of the electric waves as a weapon." In this book, I appealed my sufferings by the electric harassment and non-electric harassment. Before I published this book, I sent letters to the world leaders to appeal the danger of the misuses of the electric waves. This book includes those 7 letters. I attach 6 letters of them. I sent the first and second letters to the leaders of 190 nations. Though this book is written in Japanese, I think you can understand an outline from those letters.

I also sent this book to the President Clinton. I received his reply, very short comment. The copy is included in the letter dated September 8, 1997.

I also attach another letter to the President Clinton dated March 4, 1998. I describe my honest opinion about the misuses of the electromagnetic wave. As the misuses are totally beyond the normal mind, it is so uninteresting matter to tackle not only for normal people but also for the victims. This is a so serious matter.

I attach "Mind-Control in Japan" though you already read it.

My homepage will be based on above materials. It is my pleasure to have your suggestion and comment.

Sincerely yours,

[Japanese characters]

Terukatsu Ishibashi

...
Japan

Preface

This collection presents testimonies of Japanese victims of mind-control technology. these were provided by members of the Mind-Control Victims Association of Japan set up on January 25th 1998. There were 16 members as of the end of June, 10 of whom testified.

According to these testimonies, the problem is being caused by the perpetrators that misuse mind-control technology and by their assistant groups that behave as their hands and feet. the sufferings of victims are divided into three types of harassments, that is electric harassment, annoyance harassment by assistant groups, and a combination of both. Sufferings by the electromagnetic waves in the Japanese version are very varied. this means that the electromagnetic waves can be misused in many different ways. There are, of course, common types of misuses. These common types of misuses suggest that a lot of crimes might be perpetrated by this technology's misuses. Some serious crimes taking place in Japan these days do not seem to be natural for Japanese society. This reality makes one presume the presence of outside factors, for example, mind-control technology. The fact that the problem is a key to understanding our society indicates that the perpetrator is also deeply involved in Japanese society. The situation would be similar in other countries. The problem must be an inevitability of human history though the total reality is still hidden.

Once people become aware of this problem in human history, the right approach to solving it will be found. Human beings cannot continue to unless the 21st century will be established as the time of all mankind. I believe it will be the first step to the age of all mankind to disclose the misuses of mind-control technology. Can human beings recover human history as their own history? It is impossible to do so unless we understand the existence of the hidden history and its reality. Once we are aware of these, we will also become aware of the existence of secret groups that have embraced mind-control technology. The secret groups have manipulated human history, and they have misused the technology as their latest weapon to complete their world domination. Human beings can realize the problem in human history through understanding the above. The 21st century will be a time of conflict when public history becomes real history. We must never again permit hidden history to establish the age of all mankind. When human beings are able to find a way to conquer hidden history, the way to the age of all mankind will be opened widely.

Mother and children allege microwave targeting Delores Hejazi died of throat cancer

A Parma woman charged in the fatal stabbing of one daughter and the wounding of two other daughters believes the government controls the [unreadable] and are bombarding her and her family with laser beams, a psychiatrist testified yesterday.

Dr. Dallas D. Erdmann of the Cuyahoga County Court Psychiatrist Office testified yesterday that Delores Hejazi suffers from chronic paranoid schizophrenia and delusions that render her incompetent to stand trial.

On Jan. 30, Hejazi, 34, allegedly plunged a 10-inch butcher knife into the chest of her daughter, Jennifer, 10, at their home on Daleside Dr. Another daughter, Katie, 2 was stabbed in the neck and a third daughter, Sarah, 8, was stabbed in the chest and stomach.

Hejazi allegedly also stabbed herself in the stomach and nearly severed her hand from her arm.

Erdmann told Common Pleas Judge Thomas J. Pckorny that while Hejazi understood court proceedings, she was not competent to stand trial because she could not help her lawyers in preparing her defense. She is charged with one count of aggravated murder and two counts of attempted murder.

"She has a number of delusions and she discussed the concerns she has made over the past two years of being repeatedly attacked and tortured by government agencies, beam weaponry and laser technology," said Erdmann, who examined her for 4 hours over two days. Other forms of torture included sexual recordings and death recordings, and she and her children suffered laser burns and joint pains."

Erdmann said he believed Hejazi's mental illness began about three years ago. She was hospitalized at Parma Community Hospital in September 1989 and at Deaconess Hospital in July 1990, he said.

Hejazi's unwillingness to understand her illness kept her from weighing the possibilities of her defense. Erdmann said, including pleading not guilty by reason of insanity, which she has refused to allow her lawyers to do.

Jeffrey Kelleher, Hejazi's lawyer, said Hejazi believed giant computers controlled the world and that the government was out to destroy her because her research had uncovered the government's plot.

[unreadable] Kelleher said, "There is evidence it was an altruistic act."

Kelleher said his client wanted a jury trial so she could tell the world what was happening. She has written numerous letters over the years to the Pentagon, government officials, television journalist Geraldo Rivera and others, alleging a government conspiracy.

Erdmann said that if Hejazi was confined and required to take psychotic medications and drugs, she could become competent to stand trial in a year.

Assistant Prosecutor Lonjak said he believed Hejazi was competent and should be tried.

Pokorny will continue the [unreadable] next week.

[End of article. Note that Delores Hejazi was in touch with mind control victims groups who believed her case was not mental illness but government mind control. Hejazi was diagnosed with throat cancer and died shortly after being committed to a mental institution.]

Prisoner's Case

JONES v. AULT cite as 67 F.R.D. 124 (1974)

128

67 FEDERAL RULES DECISIONS

ills resulted from exposure to electrical or sonic waves transmitted by the machine referred to?

of perfection." Jones says that cross-examination of "Behavioral Biologists" and psychiatrists is necessary in order

Final Order

Plaintiff has responded to the several queries addressed to him in the Order of this court dated November 19th. The questions sought to ascertain the basis in fact rather than mere conclusions as to use at Georgia State Prison of a machine or device by which Jones' brain is probed and monitored by electric or parabolic sound waves designed to achieve behavioral control.

Claiming violation of his constitutional rights as to freedom of thought and against unreasonable search and seizure, cruel and unusual punishment and deprivation of due process, plaintiff sues for damages pursuant to 42 U.S.C. § 1983. ¹

In petitioner's answer to the questions propounded by the Court, he admits that he has not seen the machine nor has any other inmate, to his knowledge. "But we know that they exist by the powers of perfection." Jones says that cross-examination of "Behavioral Biologists" and psychiatrists is necessary in order to prove that he is being subjected to a Behavior Modification Program by use of "parabolic waves or a strange alien current or radiation waves". Plaintiff informs the Court that the device may be located at Reidsville but that the "most likely place" at which the electronic machines are set up is at the Central State Hospital at Milledgeville.

The waves particularly attack the pituitary gland which, petitioner says, is the most important portion of the "emotional brain". However, they are directed at various other parts of his body, causing such symptoms as itch between the legs and his private parts and in the rectal area; hunger after eating; sleeplessness; sexual self-excitation; loss of memory; sluggishness; depression; paranoia; fire in the stomach and chest; migraine, et cetera.

Plaintiff alludes to the development of sophisticated electronic devices which are capable of picking up whispers in a room and broadcasting them to a receiver a half block away. I am cognizant of modern developments in that field. Indeed, space-age, microminiaturized electronic gadgets make it possible to attach radio receivers to experimental animals with implanted electrodes being activated by remote control so that selected regions of the hypothalamus may be electrically stimulated to produce aggressive or submissive behavior as well as sexual and appetitive responses in animals. ²

1. After this court's first Order, an identical complaint filed by Jones in the Northern district of Georgia was transferred to this jurisdiction for convenience of parties and witnesses. That action is consolidated with the case now before this Court.

2. C.U.M. Smith. *The Brain. Towards an Understanding* (Putnam Sons. New York, 1970) 236-239. 244-245. "The implantation of [not readable] ...haviour has become a common technique ... Among the specific behaviour patterns that have been evoked by electrical stimulation at different sites in the brain are eating, drinking and fighting." Keith Oatley. *Brain Mechanisms and Mind* (E. P. Dutton. New York. 1972). 127. The technical papers and studies cited by these two authors include: J.M.R. Delgado. "Free behaviour and brain stimulation". ...

Note: JONES v. AULT was dismissed as 'frivolous' by the judge. Cases filed by alleged mind control victims do not even reach the discovery phase of typical court cases. Nearly 100% of the time, the judge will dismiss the case and the reasons given are that the legal system does not recognize mind control technology as real and therefore the claim could never be proven in court, therefore the claim is described as 'frivolous', i.e. a legal term meaning the case is unprovable, and is dismissed.

Mind Justice - Timeline, EMF

Timeline of Important Dates in the History of Electromagnetic Technology and Mind Control By Cheryl Welsh

[Mind Justice Home Page](#)

This timeline will demonstrate the US government and the military industrial complex involvement and the state of the technology from several independent unclassified reliable sources. This is a sample of the sources of information on this topic. These topics need further investigation.

1942-1947

From *Cybernetics* by Norbert Wiener, Wiener is the originator of cybernetics. New York Times wrote this comment about the book. "One of the most influential books of the twentieth century... *Cybernetics* was judged by twenty-seven historians, economists, educators, and philosophers to be one of those books published during the "past four decades," which "most significantly altered the direction of our society..."

A quote from this book, "This existence of sharp frequencies in brain waves and the theories which I gave to explain how they are originated, what they can do, and what medical use may be made of them represent in my mind an important and new breakthrough in physiology. Similar ideas can be used in many other places in physiology and can make a real contribution to the study of the fundamentals of life phenomena."

The book further states: "The nucleus of our meetings has been the group that had assembled in Princeton in 1944, but Drs. McCulloch and Fremont-Smith have rightly seen the psychological and sociological implications of the subject and have co-opted into the group a number of leading psychologists, sociologists, and anthropologists. The need of including psychologists had indeed been obvious from the beginning. He who studies the nervous system cannot forget the mind, and he who studies the mind cannot forget the nervous system.

Weiner also writes, "I had known for a considerable time that if a national emergency should come, my function in it would be determined largely by two things: my close contact with the program of computing machines developed by Dr. Vannevar Bush, and my own joint work with Dr. Yuk Wing Lee on the design of electric networks.

And finally, "Dr. Rosenblueth at a meeting held in New York in 1942, under the auspices of the Josiah Macy Foundation, and devoted to problems of central inhibition in the nervous system. Among those present at that meeting was Dr. Warren McCulloch of the Medical School of the University of Illinois, who had already been in touch with Dr. Rosenblueth and myself, and who was interested in the study of the organization of the cortex of the brain.

In Dr. Becker's book *Crosscurrents*, 1990, Jeremy P. Tarcher, Inc., p220 he writes about Dr. Weiner, "As a result of these comments (fluctuations of magnetic fields of the earth may cause undesirable behavioral changes), I was contacted by Dr. James Hamer of Northrop Space Laboratories, who informed me that his group was already involved in this area. He also noted that Dr. Norbert Wiener of MIT, the originator of cybernetics, had been interested in the same subject. Wiener had been involved in a German experiment in which human volunteers were unknowingly exposed to a low-intensity, 10-Hz electrical field. The subjects reported feelings of unease and anxiety when the fields were turned on. Both Hamer and Wiener were working under the assumption the ELF internal rhythms in the brain were determinants of behavior, and that pulsing external fields could "drive" these internal rhythms, thereby altering behavior."

1947

Central Intelligence Agency is formed.

1950

From *Time*, "Lost Prisoners of War: 'Sold Down the River'?" September 30, 1996 p45, House National Security Subcommittee hear about newly declassified intelligence reports and other documents and testimony of U.S. Army Colonel Philip Corso and Major General in the Czech army, Jan Sejna. "There were few doubters" ... about the fact that POWs were used as guinea pigs in experiments. "Sejna testified that the Czechs, on orders from Moscow, built a military hospital in North Korea during the war. The 'secret purpose of the hospital,' he said, 'was to experiment on American and South Korean POWs.' Prisoners were used to test the effects of 'chemical- and biological-warfare agents,' atomic radiation and 'various mind-control drugs.'"

1950

From *International Defense Review*, Vol 23; No.8, "Biological Weapons; How big a threat?" by Dr. T White and Dr. K. White, August 1, 1990. p843. "The shock of seeing American prisoners of war denounce their country after they had been brain-washed by their North-Korean and Chinese captors prompted the CIA to launch its now infamous 'MK-Ultra' project. The aim of this research was to discover the techniques and 'mind-control' drugs being used by the Chinese to subvert their American prisoners. In the course of the ICA-funded investigation, American and Canadian citizens were used as guinea pigs in experiments that have been compared with the German medical experiments in the 'death camps'."

1952

From *The Puzzle Palace*, James Bamford, 1982, Penquin, p15. November 4, 1952. The NSA, a new federal agency came into existence. "No news coverage, no congressional debate, no press announcement, not even the whisper of a rumor. Nor could any mention of the new organization be found in the Government Organization Manual or the Federal Register or the Congressional Record. Equally invisible were the new agency's director, its numerous buildings, and its ten thousand employees."

1953

From *Electromagnetism and Life*, Dr. R.O. Becker, p.227. "The possibility that the Soviet Union might be ahead of the USA in EM weapon systems has persisted at least since the discovery of the irradiation of the US Moscow Embassy in 1953." And in the *Washington Times*, Nov 15, 1992, "The Russian Government is continuing to bombard the U.S. Embassy in Moscow with

microwave radiation, according to U.S. officials." The pulsed "emanations originate from a residential building across the street that is believed to be staffed by Russian security officials." In 1976, the Globe reported that Ambassador Walter Stoessel "developed a rare blood disease similar to leukemia and was suffering headaches and was suffering bleeding from the eyes. Two of his irradiated predecessors, Ambassador Charles Bohlen and Ambassador Llewellyn Thompson, died of cancers."

And further, from *The Zapping of America*, by Paul Brodeur, W.W. Norton and Co., 1977. The investigation of this "moscow signal" was call Project Pandora and "information about it was parceled out on a strict "need to know" basis..." "In addition, the Advanced Research Projects Agency (ARPA)-a highly secret organization within the Department of Defense, which was engaged in developing a wide variety of electromagnetic weaponry, including electronic sensors and other devices that were designed to detect enemy movement on the Ho Chi Minh Trail and elsewhere in Vietnam-set up a special laboratory at the Walter Reed Army Institute of Research, in Washington, DC where, over a number of years, experiments were conducted in which rhesus monkeys were irradiated with microwaves at power densities and frequencies similar to those of the Moscow Signal." (Mr. Brodeur published part of his book in *The New Yorker*.)

1953

From Washington Post, Aug7 1977, "Psychic Spying? The article discussed Dr. Andrija Puharich. "His connections with the military/ intelligence communities go back to the early 1950s when he worked in the Army's Chemical and Biological Warfare Center at Ft. Detrick, Md., site of the CIA's now famous shellfish toxin repository. He presented a paper entitled "On the Possible usefulness of Extrasensory Perception in Psychological Warfare to a Pentagon conference in 1952 and later lectured the Army, Air Force and Navy on other possibilities for mind warfare. Expert in hypnotism as well as microelectronics, Puharich also invented a miniature tooth radio, reportedly for the CIA."

1970

From *The Mind Manipulators*, Alan W. Schefflin, 1978, Paddington Press, Ltd. p 348, On tracking humans such as prisoners, he writes, "During the Nixon administration, the United States government was sufficiently intrigued by the possibilities of tracking (both with and without ESB,(Electronic Stimulation of the Brain)) to commission a report on the state of the art and the pertinent law. It chose as its reviewer Ralph K Schwitzgebel, the leading experimenter on tracking, then a researcher at Harvard University. He reported that tracking was close to being practical and effective, and that is was legally acceptable."

1972

From *Psychic Warfare*, Martin Ebon, 1983, McGraw Hill, p12. A (1972) report by Defense Intelligence Agency stated, "the major impetus behind the Soviet drive to harness the possible capabilities of telepathic communications, telekinetics and bionics is said to come from the Soviet military and the KGB."

1974

From *The Body Electric*, Dr. R. O Becker, p321 The following research plan was released under the Freedom of Information Act. "The experimenter, J.F. Schapitz, stated: "In this investigation it will be shown that the spoken word of the hypnotist may also be conveyed by modulated electromagnetic energy directly into the subconscious parts of the human brain-i.e., without

employing any technical devices for receiving or transcoding the messages and without the person exposed to such influence having a chance to control the information input consciously." As a preliminary test of the general concept, Schapitz proposed recording the brain waves induced by specific drugs, then modulating them onto a microwave beam and feeding them back into an undrugged person's brain to see if the same state of consciousness could be produced by the beam alone."

"...The second experiment was to be the implanting of hypnotic suggestions for simple acts, like leaving the lab to buy some particular item, which were to be triggered by a suggested time, spoken word, or sight. Subjects were to be interviewed later. "It may be expected," Schapitz wrote, "that they rationalize their behavior and consider it to be undertaken out of their own free will."

And in *Lobster Magazine* an article by Martin Cannon states: "Schapitz' work was funded by the Department of Defense. Despite FOIA requests, the results have never been revealed." Further, "His (Schapitz') instincts on this latter point (rationalizing their behavior) coalesce perfectly with findings of professional

hypnotists.⁶⁶ In the same article in footnote 66, "See Bowart p 218 (Operation Mind Control) for an interesting example. This rationalization process at work in the case of Sirhan Sirhan, who was convicted of the assassination of Robert F. Kennedy. In prison, Sirhan was hypnotized by Dr. Bernard Diamond, who instructed Sirhan to climb the bars of his cage like a monkey. He did so. After the trance was removed, Sirhan was shown tapes of his actions. He insisted that he 'acted like a monkey' of his own free will-he claimed he wanted the exercise!"

1975

From *Crosscurrents*, Dr. R.O. Becker, 1990,p224, "Since the mid-1970s, (Jose) Delgado has been director of the premier Spanish neurophysiological laboratory, Centro Ramon y Cajal. His interest has shifted from direct electrical stimulation of the brain to the broader area of the biological effects of electromagnetic fields. He has studied the influence of specific frequencies of magnetic fields on the behavior and emotions of monkeys, without using any implanted electrodes or radio receivers. While Delgado did not publish any of this work in the scientific journals, its existence leaked out."

1976

From *The Zapping of America*, Paul Brodeur, 1977, p 300-301. "A report published in the New York Times on October 30, 1976, revealed that in recent months a mysterious broadband, short-wave radio signal had been broadcast intermittently from the Soviet Union. The signal was so powerful that it disrupted radio and telecommunications throughout the world." "Dr. Zaret is concerned about the Russian signal, ..because of its potential hazard to human beings. ..it was very clear that such an encoding impressed onto carrier wavelengths could have a central-nervous- system effect."

From *Body Electric*, Becker 1985, p323. Complaints from the UN International Telecommunications Union have not stopped the signal. The signal now has holes and skips crucial, (emergency frequencies for aircraft, etc.) frequencies as it moves up and down the spectrum.

From *NBC Magazine* with David Brinkley, July 16, 1981, p3. David Brinkley states: "As I say I find it hard to believe, it is crazy and none of us here knows what to make of it: the Russian

Government is known to be trying to change human behavior by external electronic influences. We do know that much. And we know that some kind of Russian transmitter is bombarding this country with extreme low frequency radiowaves."

From p13-14, the article further states. "This man's name is William Bise. ...for the past four years he has traveled the Pacific Northwest monitoring strange radio signals." Garreck Utley asks "To what extent can you disrupt the mental process, the brain through the use of electronic fields, microwaves? Bise replies, "Will I would think that the easiest way to do it would be microwaves." Garreck Utley stated, "Bise has limited equipment but other sources, some of them classified, have traced the signals to transmitters in the Soviet Union. Those sources will not discuss their work. Bise will."

1976

From Planetary Association for Clean Energy, July 1979, Newsletter by Dr. Andrew Michrowski, "USSR ELF (extremely low frequency) Emissions." "At least five USSR installations are operating simultaneously up to 24 hours daily since July 1976, with an intensity of up to 40 million watts. The installations appear to liase with the highly magnetic MHD apparatus located at Semipalatinsk" Non-Hertzian, resonant effects are produced. Because of this, their mathematical description is non-linear and based on the physics concepts of soliton-- fields that demonstrate prolonged states of existence." There are psychophysical, and physical effects. The signals have the unique capacity to penetrate buildings and living tissues. Magnetic intensity (at 500 microgauss) for such frequencies have been monitored.

This and other evidence suggests that the Soviet Woodpecker signal "entrain and capture the brains of the biosystems by placing them in forced sympathetic resonance."

This also corresponds with research of Dr. Ross Adey, of University of California's Brain Research Institute who conducted research on emf and brainwaves and confirmed that brainwaves could be entrained to externally generated signals. His work was funded by the U.S. Navy.(The Zapping of America, Brodeur,p84 and Body electric, Becker, p319)

1976

From Mind Wars by Ron McRae,1984, St. Martin's Press. McRae worked with Jack Anderson. The book states, "In 1976, the CIA contracted for an exhaustive review of Soviet parapsychology research by outside experts," The report was titled, "Novel Biological Information Transfer Systems" by Dr. J.W. Eerkens, et al and Dr. Eerkens "now believes 'the Soviets are actually building prototype equipment for psychic warfare'.

1977

From Zapping of America,1977, Paul Brodeur,p298. An article in the New York Times, July 20, 1977 stated, "CIA documents revealed that the agency had conducted a fourteen-year program to control human behavior with drugs, electric shock, radiation, and ultrasonics."

1977

From Psychic Warfare by Martin Ebon,1983, McGraw-Hill, p116-117. "Public evidence for an attempt at influencing U.S. officials during a visit abroad was presented by Dr. Sidney Gottlieb on September 21, 1977, during testimony before a Senate sub-committee. Dr. Gottlieb, then retired, had been the CIA's director of mind-control experiments." "He told the committee that...several members of President Nixon's staff had shown 'inappropriate' behavior." Including

"crying without provocation."

"In other parts of his testimony, Gottlieb did include the President himself among those who seemed to be affected by some type of unusual influence. Gottlieb stated, "Not too long ago, in connection with a presidential visit to a potentially hostile country, the President, when he came back, described some unusual feeling he and others had and asked if I would be able to give counsel." "(President Nixon visited a 'potentially hostile' country the Soviet Union in 1972.)"

1977

From audiotape by Dr. Andrija Puharich at an Electromagnetic Conference, September 1987. "We were able to develop a hearing device that fit under the cap of a tooth and we could hear very clearly from a small little relay and receiver and transmitter and unfortunately it was promptly classified by an agency of our government. But we did solve the problem in terms of hardware. "About ten years ago in 1976, no I'm sorry early 1977 I made the basic measurements which showed the elf nature of elf coming from Russia and that it was psychoactive, that was my finding and I deduced the chemicals that were released by the frequencies that were being used and I passed that information onto every intelligence agency we have in this country from the president on down and England and Canada and all I got was four years of harassment. My house was burned down, I was shot at, they tried to kill me, they tried to eliminate me, etc., etc., and finally they agreed I was right and in 1981, the U.S. government went into full scale elf warfare and set up all their big transmitters down under in Australia and Africa so on and so on and now their in business and everything's classified and you can't say a god damned thing about it, a tough situation. And you can't get any real information out of any government agency. And I know all of them that do the work. I know the people who head the projects etc. When they're in trouble, they usually come ask me. And they classify what I tell them. Insanity."

1978

From Planetary Association For Clean Energy, 1978, Dr. Andrew Michrowski. "Potentially, almost anything could be inserted into the target brain mind systems, and such insertions would be processed by the biosystems as internally-generated data/effects. Words, phrases, images, sensations, and emotions could be directly inserted and experienced in the biological targets as internal states, codes, emotions thoughts and ideas," This conclusion developed in part out of research by the Russian scientist, Litisitsyn's 1968 US Defense Documentation Center paper. Retired Col Tom Bearden commented on the paper which reported the Soviets "worked out 23 EEG band-wave lengths, 11 of which were totally independent."

1979

From US Psychotronics Association. Conference 1979 Dr. Beck then read excerpts of a scientific research paper co-authored by Dr. MA Persinger of Laurentian University, Canada, an expert on elf radiation. "Human subjects exposed to certain ELF field patterns report sensations of uneasiness, depression, forboding..." Dr. Beck, a physicist who measured the Soviet Woodpecker signal stated, we found the Soviet signal coming in like gangbusters.. ...right in the window of human psychoactivity"

1980

From Military Review (official publication of the U.S. Army Command and General Staff College) article on "The New Mental Battlefield" Lt. Col. John B. Alexander, U.S. Army, Ph.D..

"(Soviet) mind-altering techniques, designed to impact on an opponent are well-advanced. The procedures employed include manipulation of human behavior through the use of psychological weapons effecting sight, sound, smell, temperature, electromagnetic energy, or sensory deprivation." He further stated, "Soviet researchers, studying controlled behavior, have also examined the effects of electromagnetic radiation on humans and have applied these techniques against the U.S. Embassy in Moscow."

Also, "Researchers suggest that certain low-frequency (ELF) emissions possess psychoactive characteristics. These transmissions can be used to induce depression or irritability in a target population. The application of large-scale ELF behavior modification could have horrendous impact."

1982

From The Weekend Guardian, "Field of Nightmares", Peter Kennard, Feb. 2-3 1991. "In 1982 a US Air Force Review of Biotechnology stated: Radiofrequency radiation (RFR) fields may pose powerful and revolutionary anti-personnel military threats...RFR experiments and the increasing understanding of the brain as an electrically-mediated organ suggests the serious probability that impressed electromagnetic fields can be disruptive to purposeful behavior and may be capable of directing and or interrogating such behaviour. Further, the passage of approximately 100 milliamperes through the myocardium can lead to cardiac standstill and death, again pointing to speed-of light weapons effect. A rapidly scanning RFR system could provide an effective stun or kill capability over a large area."

The article further states, "There is little doubt that crowd control devices using Radio Frequency Radiation do exist. The development of such devices would complement Sonic and infra-red weapons, which are well known, and were advertised in the British Defense Equipment Catalogue until 1983. These included the Vaikyrie, an infra-red device causing night blindness and the Squawk Box or Sound Curdler, developed by the US for use in Viet Nam. The Squawk Box was designed to induce feelings of giddiness and nausea in the victim, and is highly directional, so that as individuals are hit by the invisible effect, distress and confusion is spread amongst a crowd." "...In 1984 the Ministry of Defense ordered that all advertisements and references to 'frequency weapons', be cut from the Defense Catalogue."

1985

From The Body Electric, by R.O. Becker, 1985, p 323-4. The Russian Woodpecker signals are transmitted at frequencies "between 3.26 and 17.54 megahertz" and sounds like a woodpecker or buzz saw. It is pulse modulated at a rate of several times a second, "in the extreme low frequency (ELF) range." The Woodpecker acts as an over-the horizon radar. "The signal is maintained at enormous expense from a current total of seven stations--the seven most powerful radio transmitters in the world."

1986

From The Boston Globe, July 7, 1989. Larry Collins, author of a fiction book about mind control. "Collins research on the theories of the paranormal and brain and behavior modification is impressive. ...He began his writing career as a correspondent for UPI and Newsweek." He interviewed William Casey, CIA director and asked "Could we influence human emotions and behavior; are or were such experiments now going on?" "This is not a subject we're going to discuss with you or anyone else," he quoted Casey as saying. "Casey's pro forma response was enough for Collins. "I knew I was on the right track."

1987

From The Nation, "Zapped? radiation at Greenham Common peace camp", editorial by Louis Slesin, p313. Nuclear protesters against the placement of cruise missiles at the USAF base in southern England claim that they were harassed with non-ionizing electromagnetic radiation in order to get them to stop protesting. In support of their claim, the author, editor of the publication Microwave News, stated, "In The Search for the Manchurian Candidate, published in 1979, John Marks relates that in response to a Freedom of Information Act request, the CIA told him that it had a roomful of files on electromagnetic and related techniques to alter behavior and stimulate the brain. The agency refused to release the papers, and they remain classified." The protesters described agonizing headaches and unexplained anxiety among other symptoms.

1988

From U.S. News and World Report, U.S. News Investigative Report, Jan 24, 1994, p 34. "The analogy to brainwashing was obvious to the CIA which provided a \$60,000 grant through the Human-Ecology Society. Nine of Cameron's former patients, who had sought treatment for depression, alcoholism and other problems at the Allen Memorial Institute at McGill University, (in Canada) where Cameron was director, filed lawsuit against the CIA in 1979. One patient, Rita Zimmerman, was 'depatterned' with 30 electroshock sessions followed by 56 days of drug-induced sleep. It left her incontinent; other suffered permanent brain damage, lost their jobs or otherwise deteriorated. The case, Orlikow v U.S. was settled in 1988 for \$750,000."

1990

From The Washington Times, "Mills mixes mind control matters," by Harvey Hagman, October 12, 1990, pE1 James Mills wrote The Power, a fictional account of psychic weapons. "The former UPI reporter and associate editor of Life magazine says he spent 3 ½ years researching and writing The Power including ferreting out Defense Intelligence Agency documents and traveling to France and the Soviet Union. ...So does Mr. Mills really believe 'spiritual warfare' is being waged? "Absolutely," he says. and so do the Pentagon and the Kremlin. ...There are documented cases of suspected KGB paranormal attacks against Nixon and Carter."

Excerpt from Larry King Live September 12, 1990, Transcript 127.

James Mills, author of The Power. "It is based on a lot of research. I have three Defense Intelligence Agency studies that are in large measure an assessment of the Soviet threat in this area. They say that there is a possibility that Soviet advances in psychic weaponry would enable them to, and there are direct quotes, 'mold the thoughts at a distance of key military and civilian leaders, cause the death at a distance of key military and civilian leaders, know the contents of top secret documents, troop movements, locations of military installations.' This report was produced in 1975 so this is what they were worried about then and it makes you wonder where we have come since then."

Mr. Mills states further, "I know for a fact that the Soviet Union had a mind control device that they said had military applications. They said it was valuable for reducing what they call neural tension in combat troops and which could certainly be used to reduce the aggressiveness and energy of our troops. I know that, because I've seen the machine. ...The one I've seen is a very, very old one. ...It came over from the Soviet Union in the mid-1970s to an American government research lab on the west coast. ...It used heat, sound, and light radiation, and very high frequency electromagnetic radiation to affect the central nervous system and affect mental processes."

1990

From The Atlantic, "The Zap Gap", March 1987, Chuck de Caro, p 24-28. "Soviet Military Power, Department of Defense, "Recent Soviet developments in radio frequency generation devices could enable them to build weapons to degrade or destroy electronics or cause disorientation of personnel. They have generated single pulses with peak power exceeding one gigawatt and repetitive pulses over 100 megawatts." The article also states, "If, going further, an RF pulse could be propagated over a wide zone, in roughly the same way that radio signals can blanket a city, it might act as an electronic wall, disabling the silicon brains of any approaching airplane, tank, or missile."

1990

From Crosscurrents, 1990, Dr. Becker, p304. "I have made no attempt here to review in any detail the relationship between military considerations and the hazards of man-made electromagnetic fields. This complex and dangerous situation lies outside the scope of this book, except for an indication of how the political policies derived from it have effectively hampered the public recognition of the hazards. In my opinion, the military establishment still believes that the survival of the military organism is worth the sacrifice of the lives and health of large segments of the American population."

1990

From Time, July 30, 1990, Technology, p53, "Hidden Hazards of the Airwaves, An obscure newsletter uncovers the perils of the information age". "In the current issue of Microwave News, Slesin has printed what may be his greatest scoop: the key paragraph of a two-year Environmental Protection Agency Study recommending that so-called extremely low-frequency fields be classified as 'probable human carcinogens' alongside such notorious chemical toxins as PCBs, formaldehyde and dioxin.' The recommendation, which could have set off a costly chain of regulatory actions, was deleted from the final draft after review by the White House Office of Policy Development. "The EPA thing is a stunner," says Paul Brodeur, a writer for the New Yorker.

"It's a clear case of suppression and politicization of a major health issue by the White House."

The article states further, "Louis Slesin's stories have a tendency to shock. Like the one about the 23 workers of the Bath Iron Works in Bath, Me, who got 'sunburns' one rainy day when someone on a Navy frigate flicked on the ship's radar. Or the trash fires that start spontaneously from time to time near the radio and TV broadcast antennas in downtown Honolulu. Or the pristine suburb of Vernon, NJ., that has both one of the world's highest concentrations of satellite transmitting stations and a 'persistent' and unexplained-cluster of Down's syndrome cases."

1993

From The Sacramento Bee, "Energy Chief says U.S. owes radiation victims," Wed Dec. 29, 1993, pA1. "The U.S. government should compensate victims of radiation testing conducted as part of its Cold War nuclear program, Energy Secretary Hazel O'Leary said Tuesday as disclosures mounted about extensive experiments involving humans as often-unwitting subjects."

1993

From "Nonlethal Technology and Airpower: A winning Combination for Strategic Paralysis" by Maj. J. W. Klaaren, USAF and Maj. RS Mitchell, USAF, Air Command and Staff College, 1993,

Air University Press, Center for Aerospace doctrine, Research and Education, Maxwell Air Force Base, Alabama. This article is an excerpt from a research project by the authors et al. It states, "Currently, the best method of accomplishing this is to have developers of nonlethal weapons (agencies such as the Advanced Research Projects Agency (ARPA), military laboratories, and national laboratories) visit the operational commands. We need to stress how these weapons will be force multipliers and ..."

The article further states, "In 1993, for example, ARPA provided grant money to regional business alliances. Comprised of civilian-sector businesses and government organizations, these alliances competed for grants to develop new technologies... The scope of this program could be expanded to include nonlethal technology..." And also, "Although the United States may choose not to pursue mind-altering drugs as a weapon, other states may hold a different view. For that reason, it is imperative that we understand this capability."

The article concludes "We maintain that future conflicts will demand the use of nonlethal warfare and that aerospace platforms can provide an effective method for the employment of nonlethal weapons. ...Our research for this article was an eye-opening experience for us." The article lists in "Table 1 Selected Types, Examples, and Capabilities of Nonlethal Weaponry" and under "Electromagnetic Electrical interferors (power effects, pulses) degrade/destroy equipment and systems"

The article lists sources including, "Alan W. Debban, "Disabling Technologies and Applications," HQ USAF/XOXT background paper, 22 February 1993; Herbert H. Dobbs et al., "Assessment of Mission Kill Concept, Requirements and Technologies" Washington, DC: Defense Advanced Research Projects Agency, September 1990); And finally, in the Notes of the article is the following: "1. John B. Alexander, Los Alamos National Laboratory, NM, presentation on nonlethal weapons and limited-force options, Council on Foreign Relations, New York, 27 October 1993."

1993

From Defense Week DW Vol. 14, Nu 46 p1, "Non-lethal Weapons Group Set To Form In March", Andrew Weinschenk, "The Army plans to appoint a senior advisory group in March to guide development of 'non-lethal' weapons and draft a first-ever masterplan detailing future doctrine, training and materiel issues, according to service and industry sources." The article also states, "The Army Research Laboratory's Steve Taulbee, for example, said researchers there have experimented with a radio-frequency pulsing device. The weapon would disrupt an enemy's internal organs but it might also permanently destroy the liver."

1993

From Defense Electronics, July 1993, "DOD, Intel Agencies Look at Russian Mind Control Technology, Claims FBI Considered Testing on Koresh." by Mark Tapscott. "In a series of closed meetings beginning March 17 in suburban Northern Virginia with Dr. Igor Smirnov of the Moscow Medical Academy, FBI officials were briefed on the Russian's decade-long research on a computerized acoustic device allegedly capable of implanting thoughts in a person's mind without that person being aware of the source of the thought."

1993

From Defense News, Jan 11-17, 1993, "U.S. Explores Russian Mind-Control Technology" by Barbara Opall, p29. "The Russian authors note that "World opinion is not ready for dealing

appropriately with the problems coming from the possibility of direct access to the human mind." And further, "The Russian experts, including George Kotov, a former KGB general now serving in a senior government ministry post, present in their report a list of software and hardware associated with their psycho-correction program that could be procured for as little as \$80,000."

1994

From The Bulletin of the Atomic Scientists, Sept, Oct 1994, "The Soft Kill Fallacy", Steve Aftergood with Barbara Hatch Rosenberg, p45. "Many of the non-lethal weapons under consideration utilize infrasound or electromagnetic energy (including lasers, microwave or radio-frequency radiation or visible light pulsed at brain-wave frequency) for their effects. These weapons are said to cause temporary or permanent blinding, interference with mental processes, modification of behavior and emotional response, seizures, severe pain, dizziness, nausea and diarrhea, or disruption of internal organ functions in various other ways."

The article further states, "In addition, under the Certain Conventional Weapons Convention, international discussions are now under way that may lead to the development of specific new protocols covering electromagnetic weapons; a report is expected sometime next year."

1995

From The Guardian "The Future Art of War", May 25, 1995. Nic Lewer, peace researcher at the University of Bradford, in the latest issue of Medicine and War, lists "more than 30 different lines of research into 'new age weapons'..." the article further states, "Some of the research sounds even less rational. There are, according to Lewer, plans for 'pulsed microwave beams' to destroy enemy electronics, and separate plans for very-low-frequency sound beams to induce vomiting, bowel spasm, epileptic seizures and also crumble masonry."

Further the article states, "There are plans for 'mind control' with the use of 'psycho-correction messages' transmitted by subliminal audio and visual stimuli. There is also a plan for 'psychotronic weapons' - apparently the projection of consciousness to other locations- and another to use holographic projection to disseminate propaganda and misinformation."

1995

From Free Thinking, Vol. 1. Number 4, March 1995, "President's Committee on Radiation Hears Mind Control Survivor's Testimony". "For the first time in history officials heard evidence of the atrocities of mind control which were committed along with the radiation "research". Ms. Wolf is among a number of independent researchers around the world who have come up with identical cases in which survivors of radiation treatment describe life-long mind control abuses at the hands of the U.S. government."

"While the radiation "research" was conducted under the direction of the Atomic Energy Commission, many of the same scientists who were involved in the CIA's MKULTRA program acted as overseers of the radiation experiments. Among these scientists were Dr. Martin T. Orne, Dr. Sidney Gottlieb, and Dr. L. Wilson Green." Also, "A licensed sociologist from New Orleans, Wolf offered her testimony and supporting evidence to the committee in a hearing on March 15th. Focusing on the 9,000 children who were targets of radiation experiments conducted by the Atomic Energy Commission and kept secret under the National Security Act, the precious ten minutes granted Ms. Wolf was a precedent setting digression from the investigators' agenda."

1996

From Nexus Magazine, "Soul Catcher Implants", Oct/Nov 1996. "British scientists are developing a concept for a computer chip which, when implanted into the skull behind the eye, will be able to record a person's every life time thought and sensation. "This is the end of death," said Dr. Chris Winter of British Telecom's artificial-life team. He predicts that within thirty years it will be possible to relive other people's lives by playing back their experiences on a computer."

The article further states, "By combining this information with a record of a person's genes, we could recreate a person physically, emotionally and spiritually." Dr. Winter and his team of scientists at BT's Martlesham Heath Laboratories, near Ipswich, call the chip "the Soul Catcher." The author, David Guyatt states that, "British Telecom, Britain's giant telecommunications enterprise, has a long history of involvement with the intelligence services." This article quotes it sources as, "The Daily (London) Telegraph, July 18, 1996.

1996

From USAF Scientific Advisory Board, New World Vistas Air and Space Power for the 21st Century, Ancillary Volume, p89. "Prior to the mid-21st century, there will be a virtual explosion of knowledge in the field of neuroscience. We will have achieved a clear understanding of how the human brain works, how it really controls the various functions of the body, and how it can be manipulated (both positively and negatively). One can envision the development of electromagnetic energy sources, the output of which can be pulsed, shaped, and focused, that can couple with the human body in a fashion that will allow one to prevent voluntary muscular movements, control emotions (and thus actions), produce sleep, transmit suggestions, interfere with both short-term and long-term memory, produce an experience set, and delete an experience set. This will open the door for the development of some novel capabilities that can be used in armed conflict, in terrorist/hostage situation, and in training..."

It is interesting to note that two scientists with connections to CIA classified mind control and psychic research have contributed to this study. Dr. J West, MD Director Emeritus, Neuropsychiatric Institute, UCLA, School of Medicine, Behavioral biology and Dr. Edwin May, PhD, Science Applications International Corporation,(SAIC) Physics of Consciousness.

This timeline demonstrates how classified the electromagnetic and mind control technology is. Scientists have been killed for revealing this technology. They have lost government funding. They can be prosecuted and or lose their jobs if they reveal national security secrets. And some scientists have been targeted with the technology and have been unfairly labeled mentally ill.

A similar analogy would be the Manhattan Project, the U.S. government program to build the atomic bomb. The project used the highest of national security precautions, and few knew of its existence. Mind control technology is the currently classified weapons program and national security methods are even more entrenched and developed.

UC Davis Electrical Engineering Student Report

**1. Current feasibility of antipersonnel
electromagnetic weapons on the battlefield and**

**2. Current feasibility of remote surreptitious
tracking and targeting of humans via satellite**

**by Zhijun Wei, UC Davis electrical engineering student,
with background information**

**by Cheryl Welsh, director, Mind Justice
October, 2005**

A special thanks to Allen Barker, Bob Dunn, Ted Jackson, Julianne McKinney and Susan Saylor for their significant contributions to background information.

[Mind Justice Home Page](http://mindjustice.org)

Table of Contents

1. [Introduction](#).
2. [Zhijun Wei evaluates 1988 German think tank article](#) on battlefield use of antipersonnel electromagnetic weapons. *Wei concludes; "In order to have enough energy to reach the target, high power sources and highly directional antenna are key technologies. The weapons described below are possible (and provide a glimpse of what future warfare may be like)."*
3. [Zhijun Wei on detecting brain signals remotely](#). Detecting brain signals is possible at lesser distances and very challenging from satellite.
4. [Zhijun Wei on feasibility of remote targeting of humans via satellite](#). Remote targeting is possible at battlefield distances but is questionable from a satellite.
5. [Satellite surveillance technology](#); extremely advanced, classified and well-funded since 1940s.
6. [Remote sensing of humans](#) is a 2003 goal of U.S. Special Operations Command. One of the rare times this goal has been cited. Surreptitious human surveillance is classified and controversial.
7. [Sophisticated remote mind control capabilities](#) are classified and controversial. How advanced the capabilities are is not known but powerful battlefield and mind control weapons are scientifically feasible today.
8. [New research on targeting the brain](#) indicates electromagnetic brain communication is a scientifically valid theory.
9. [Government goals](#) of developing electromagnetic brain cognition and non-invasive brain to brain communication devices.
10. [Nonlethal and information weapons programs](#) in 2005; reports of excessive secrecy and little

accountability. Ethical abuses are being reported with recommendations of further study, discussion and regulation.

1. Introduction

Jose Delgado "was among the world's most acclaimed and controversial neuroscientists in the early 1970s, according to an article on brain chips in the October, 2005 Scientific American. The article explained that in the mid-1980s an article in the magazine Omni and documentaries by the BBC and CNN cite Delgado's work as circumstantial evidence that the U.S. and Soviet Union might have secretly developed methods for remotely modifying people's thoughts. Noting that "the power and precision of electromagnetic pulses decline rapidly with distance" and "how complex information is encoded in the brain [is] a goal that neuroscientists are far from achieving.", Delgado dismisses these mind-control claims as "science fiction".

It turns out the answer to the question of whether remote government mind control is scientifically feasible today is not that simple. Sophisticated mind control, i.e. thought reading, implanting thoughts, manipulating emotions, etc. is considered science fiction but this conclusion completely ignores the large classified mind control government research known to exist. In addition, mind control is much more advanced than generally believed. For example, in the Scientific American article, Delgado delineated the mind control issue into therapeutic 'mind control' which Delgado found to be unreliable in humans and nontherapeutic 'mind control' in which Delgado's research was successful and 'could control subjects' minds and bodies with the push of a button."

The question of whether remote human surveillance is scientifically feasible is also generally considered to be science fiction. This conclusion also ignores the large classified government research known to exist in this area. Again, remote human surveillance is also much more advanced than generally believed. A closer look reveals that this field is rapidly changing. A Spring 2003, IEEE Technology and Society Magazine article entitled 'Geoslavery' by Jerome E. Dobson and Peter F. Fisher illustrated possible human rights abuse from the misuse of satellite targeting and surveillance technologies.

The IEEE article continued; "Geographic information systems (GIS) technologies, including Location Based Services (LBS) continuously fed by earth coordinate data streams derived from the Global Positioning System (GPS), recently have given rise to new consumer products advertised for tracking humans as well as animals. It is well established scientifically that humans can be tracked via satellite with a transponder, "a wristband to be locked to the individual enabling tracking of all movements, for prisoners, children and senior citizens."

The IEEE article then characterized recent news of rats trained to be remotely controlled by direct electronic stimulation of the brain from up to 500m and concluded that "linking this to a GIS with a digital map and GPS location information is almost trivial technically."

Geoslavery as defined in this article is "a practice in which one entity, the master coercively or surreptitiously monitors and exerts control over the physical location of another individual, the slave." The article described a scenario of monitoring and also remote control by sending a command transmitted instantaneously to the transponder, which would administer punishment or an electronic form of geoslavery. No products that deliver punishment are known to currently exist, according to the article. The main issue was described as a lack of restrictions on commercial monitoring products and a lack of legal remedies for abuses involving this technology.

Zhijun Wei is a UC Davis electrical engineering student hired by Mind Justice to answer the question of whether humans could be remotely targeted without a transponder, directly via a satellite. Without an implant or transponder, the possibility of surreptitious surveillance would be a serious concern. Zhijun Wei analyzed

the scientific literature to determine whether the science is feasible for a human to be tracked via satellite without a transponder. Zhijun Wei also evaluated one battlefield description of electromagnetic weapons. Wei concluded the article descriptions "provide a glimpse of what future warfare may be like" and that the descriptions were scientifically valid.

Due to limited time and resources, Zhijun Wei conducted only preliminary research on this topic. But Wei was able to conclude that the science is feasible for remote human surveillance but is extremely challenging directly from a satellite. Wei's analysis involved such broad fields including electrical and biomedical engineering, therefore this report only provides a general overview.

Wei concluded, "it is evident that targeting a human being from a far distance is realizable with current technology. But it is questionable that this can be done from a satellite." Based on Wei's findings, further technical study for the feasibility of remotely tracking human via brain waves and controlling human behavior via magnetic and electromagnetic signals by satellite is strongly recommended.

About Zhijun Wei

Zhijun Wei is currently an international graduate student in Electrical Engineering Department at University of California, Davis. He earned his B.A. in communication engineering in June, 1999 and M.E. in electromagnetic and microwave theory in June, 2002, from Northwestern Polytechnic University, China. He is now working toward his Ph.D. degree in electrical engineering and expecting to graduate in 2007. His current research is in the field of radio frequency and microwave circuit design, specifically device modeling and power amplifier design for wireless communication systems. He has one published article.

Z. Wei and A. Pham, "*Liquid crystal polymer (LCP) for microwave/millimeter wave multi-layer packaging*," IEEE International Microwave Symposium (IMS) Digest, pp. 2273-2276, Philadelphia, PA, June 2003.

The major conclusions.

This report challenges the experts' scientific criticisms of the possibility of the existence of classified remote mind control weapons and technologies today. Still, without the development of new or classified technologies, sophisticated mind control is not scientifically feasible at this time. But facts in this report significantly increase the possibility of advanced weapons. This report will document background information that is rarely reported, for example, that mind control and surreptitious surveillance are national security priorities. The implications for the public are enormous.

Mind control and surreptitious human surveillance are weapons capabilities and research is very classified and well-funded. Known but classified brain implant and mind control research dates back to the 1950s and known but classified remote surreptitious human tracking and targeting at battlefield distances dates back to the 1990s. Recent government documents include goals to develop mind control and satellite surreptitious human surveillance.

Technology has been available since 1990s for less sophisticated but very important battlefield electromagnetic and mind control weapons. Reported military discussions on deployment to Iraq of directed energy weapons including weapons that cause excruciating pain, blindness, and hearing loss, have started.

2005 articles report abuses of new surveillance technologies and electromagnetic weapons; scientists, reporters and ethicists call for studies, discussion and regulation now. This report includes recommendations on what can be done now.

The serious consequences of classified research.

In Zhijun Wei's report below, he stated that; "*Due to availability of literature and classified material on this topic, the report only covers the development of related technologies which may be used to fulfill this purpose.*" Wei's findings take on new meaning given the national security surrounding the science and technology. A quote which illustrates the effects of national security on physics research in the 1950s can be analogized to the classified science of mind control and surreptitious human surveillance. Forman, Paul. (1987) *Behind Quantum Electronics: National security as basis for physical research in the United States, 1940-1960*. HSPS 18:1.

Pg. 170; During the 1950s the cumulative number of announced and available number of papers [that were] properly published in U.S. physics journals [was]-about 50,000-but it was probably only some small percentage of the (unknown) number of security classified reports in physics

and its technical applications prepared in that decade.

The Forman quote helps to explain the profound effect classified neuroscience research has on public information. An article entitled Mind Control in the November, 2004 Discover magazine quoted many neuroscientists who did not think mind control was possible in the near future. For example, Bruce McNaughton of the University of Arizona predicted; "Don't count on it, [sophisticated mind reading] in the 21st century, or even in the 22nd," McNaughton has monitored neurons in the hippocampus of rats as they run through a maze. Once the rat learns to navigate a maze, its neurons discharge the same patterns whenever it runs the maze. And the rat will sleep and the same firing pattern often unfolds.

This pattern could be said to represent at least partially -the rat's memory of the maze. McNaughton emphasizes that the same maze generated a different firing pattern in different rats; even in the same rat, the pattern changes if the maze is moved to a different room. He thus doubts whether science can compile a dictionary for decoding the neural signals corresponding to human memories.

But a Los Angeles Times article reported that at least some human mind reading experiments have worked, as far back as 1976; "It may be only a matter of time before the machines will be able to read a person's brain waves to determine just what he is thinking." ... "George H. Heilmeier, director of the research agency, [DARPA, Defense Advanced Research Agency] dropped tantalizing hints about the EEG program in his annual report to Congress. Although he has provided few details, enough has been said about the program to raise some questions."

The article continues; "For example, could these systems be used to read the minds of prisoners of war or to pick the brains of unsuspecting American citizens. Highly unlikely, agency scientists say. "For one thing, the EEG must be individually calibrated. Brain-wave graphs mean different things for different persons. So it is necessary to obtain a baseline graph by having each individual think a specific series of thoughts. "It is quick and easy to make the calibration but it must be done for each individual." one scientist explained."

As illustrated by the Los Angeles Times article above and by the Forman quote on classified physics papers, neuroscience research concerning mind reading would be classified and not published in neuroscience journals. Mind control and human surveillance are weapons capabilities and national security priorities and to say that mind control and human surveillance are science fiction or a far future capability becomes inaccurate, incomplete and misleading. The general public is completely unaware of this very negative effect classified research can have on public information. This report challenges the one sided argument against the possibility of advanced remote mind control and surreptitious human surveillance.

2. Battlefield use of nonlethal electromagnetic weapons.

Because the following article included a relatively detailed scientific summary of the technologies involved in targeting and tracking a human with electromagnetic signals, this section is analyzed first. The 1988 publication, Executive Intelligence Review based in Germany, contains a section on soviet work on electromagnetic pulse weapons based on a survey of discussions with scientists, military officers and strategic analysts, many of whom remained anonymous. This article is one of the few detailed descriptions of electromagnetic weapons to be found in the military literature and Zhijun Wei was asked to determine if the technology described is based on basic principles of science and is reliable information.

Zhijun Wei comments in italics, *"In order to have enough energy to reach the target, high power sources and highly directional antenna are key technologies. The weapons described below are possible (and provide a glimpse of what future warfare may be like)."*

Therefore, the section below is a notable overview of the physics and science involved in electromagnetic weapons.

1988, Executive Intelligence Review Special Report, *"Electromagnetic-Effect Weapons: The Technology and the Strategic Implications"*, editor, Michael Liebig, EIR News Service Inc. This publication can be found at the UC Berkeley library or can be ordered from EIR News Service Inc., 317 Pennsylvania Ave. S.E., 2nd Floor, Washington, DC 20003 Page 14- 17.

Some ABCs of Electromagnetic Anti-Personnel Weapons by Jonathan Tennenbaum

Electromagnetic Pulse

Much more could be said about non-linear biological effects exploitable by EP weapons (see also other articles in this publication). In this short introduction, however, we want to move on to another key problem of these weapons: how to generate and deliver the destructive action to the target.

This Special Report presents some details on high-power RF and microwave generators, an area of highest priority in Soviet research and development. There are two essential types of devices which can be used in EP weapons: oscillators using beams of electrons or plasmas, and solid state devices.

In electron beam devices, like the magnetron common in older radar technology, or the more advanced relativistic devices like the gyrotron and free electron laser, an electron beam interacts with an electromagnetic field in a resonant cavity, oscillating and "pumping" energy into the field. Other advanced devices use non-linear interactions between an electron beam and plasma, or plasma oscillations directly, to generate high output. The advantage of these types of radiation sources is that their output energy, power, and power density (ratio of power to size) are theoretically unlimited.

Solid state radar, whose development is driven by the needs of military aircraft and missiles, is one of the fastest advancing areas of electronic technology today. Although solid state devices do not (yet!) reach the very high powers attained by electron beam devices, miniaturization makes it possible to build today complete, highly sophisticated phased-array radars of suitcase-size, with several kilowatts of average output. The principal advantage of this technology is that it permits extremely sophisticated 'tailoring' of pulse shape in space and time, in a compact system with direct coupling to high-speed computers. This is exactly what is needed in order to optimally exploit non-linear biological effects. What is lost in brute power is thus gained in efficiency.

Recent breakthroughs in what is called "high-temperature superconductivity" open up the perspective that both types of EP generation technology—electron beam as well as solid state—are going to undergo revolutionary improvements in the years immediately ahead. The impact of this revolution cannot even be estimated at this time, but it will certainly mean radical reductions in the size of devices having a given electromagnetic "firepower."

Holography and Electromagnetic Warfare

As our discussion of biological effects already indicated, electromagnetic anti-personnel weapons depend essentially on "tuning" the output signal to the target. This goes not only for the frequency and amplitude of the signal, but for its entire space-time "shape." Figure 6, for example, is drawn from thermographs of models of the human body irradiated by RF radiation of the same frequency, but with field geometries. These and other experiments demonstrate that the areas of maximum absorption of electromagnetic energy inside the body depend on the geometry of the incident wave. By choosing the right geometry, the energy can be focused into any desired area, such as the brain. A sophisticated EP Weapon must thus be able to project a specific geometry of electromagnetic field onto a distant object, [not readable text]... technical details of waveguides and various antenna types, we shall briefly present one of the relevant techniques: the principle of the phased array.

A phased-array antenna consists of an assemblage of many individually controlled emitting (or receiving) elements, placed in a fixed geometrical arrangement. The output field of the array is the sum of the waves emitted by the individual elements. By electronically controlling the relative phases of these individual signals, the output field can be given any desired "shape" and direction, limited only by the wavelength used, the number of elements and the size of the array. The huge Soviet ABM radar at Krasnoyarsk, for example, contains an 83 meter diameter phased array of thousands of elements. The output can consist of a single, very narrow beam, or hundreds of independently directed beams, all depending on the "phasing" of the elements. This radar can track large numbers of missiles simultaneously, without any mechanical motion of the antenna.

The functioning of phased-array antennae is thus closely related to holography, or three-dimensional photography. In a hologram, photographic plate records interference patterns, corresponding to the phase relationships of laser light reflected from the object. When the holographic plate is illuminated by a laser, the phase relationships are "reconstituted" and the viewer has the impression of seeing a three dimensional object. The ensemble of elements of a phased-array antenna takes the place of the holographic plate, but at a much longer wavelength than visible light (centimeters and millimeters instead of fractions of a micrometer). "When operated in a receiving mode, the phased array obtains much more information than an ordinary antenna; like the hologram, it measures entire electromagnetic field geometries, not merely a one dimensional

"signal."

The holographic principle underlying phased-array systems points to a potentiality for treating any desired three-dimensional, electromagnetic field distribution around a target object, from a distance, correcting for reflections, obstacles and other interference. Moreover, the field can be transformed and shifted from one location to another in space within a fraction of a second. Thus, an ideal EP-weapon could attack many individual targets, simultaneously or in rapid succession. One or more phased arrays would be used in receiving and transmitting modes to "lock-on" to selected targets, and determine the necessary geometry of the attack pulses.

To fully exploit such potentialities, the weapon would require for its target-acquisition and beam-control systems, sophisticated high-speed computers, able to perform complex computations of the "inverse-scattering" type. Miniaturized systems of this sort are well within the reach of "fifth generation" computer technology. "Hybrid" digital analog systems would be simpler, smaller, and faster still. There is much overlap in requirements between EP weapons and systems developed for strategic defense(SDI).

For concrete weapon applications, simpler devices will often suffice and trade-offs can be made among range, output power, extent of threat [not readable text]...

An obvious aspect of defense is to detect, locate, and neutralize weapons before they can be used. Antenna structures of EP weapons are resonant structures which can be detected in various ways. Spetsnaz deployment of EP weapons can be countered by intercepting the weapons or weapons components in transport, by appropriate surveillance of the areas around potential targets, and by the whole range of countermeasures which can be taken against the spetsnaz groups themselves. ...Of course, the EP weapon declares its existence as soon as it is turned on, and itself becomes vulnerable to rapid counterattack if readiness and appropriate means are at hand.

The famous "Faraday cage" and other forms of electromagnetic shielding can provide some protection against EP weapons, especially if the characteristics of the EP signal are known in advance and countermeasures are devised accordingly. Unfortunately, a sophisticated weapon can "tailor" its pulse to get through nearly any given kind of shielding utilizing non-linear, inverse-scattering techniques and a process known as "self-induced transparency." A Faraday cage under certain conditions can be transformed into an antenna, focusing the signal on the inside and even enhancing the effect for the unfortunate persons inside.

In theory, biological effects can be offset by creating a controlled "electromagnetic environment" around the target, with the effect of "detuning" the target relative to the anticipated signal of the attacking EP weapon - a kind of "immunization." To realize such potentialities will require a major research effort, but one having important spinoffs for biology and medicine.

The application of holographic principles to EP weaponry has profound implications for the future shape of warfare. The deployment of such weapons and the defense against them cannot be understood in terms of "point-to-point trajectory" concepts associated with conventional firearms and artillery. Actually, even in the past, competent military doctrine has always emphasized the geometries of "fields of fire" generated by overall deployment of mobile weapons over a given area, as opposed to mere "straight-line" action of an individual weapon. The geometrical aspect becomes much more explicit in the era of EP weaponry, in which "firepower" counts as the ability to control the electromagnetic field geometry on the field of battle, through coordinated deployment and operation of mobile phased arrays and related devices.

The situation could therefore be summed up as follows: in practice, both the use of EP weapons and defense against them is a tricky sophisticated business, if the antagonists are at comparable levels of technology, knowledge, and preparation. A surprise attack against an unprepared enemy is simpler and very devastating. In this respect, EP weapons are no exception to the general rules of warfare.

The 1988 German think tank article cited the future development of superconductive energy sources as a revolutionary development for permitting a more compact electromagnetic antipersonnel weapon for a given fire power. Two recent articles also addressed this problem and the Air Force Research Laboratory predicted an adequate superconductive power source should be available by 2009.

June 25, 2004, Dayton Daily News (Ohio);

Power for advanced weapons. AFRL [Air Force Research Laboratory] is trying to develop superconducting generators that could crank out megawatts of power for airborne lasers, other directed-energy weapons and high-power electronic systems. In a community forum last month,

Nielsen, who holds a Ph.D. in plasma physics, said, "Directed energy (today) is like Stealth 20 years ago and precision munitions 10 years ago. Directed energy could change the way we do everything in the military."

September 26, 2004, Dayton Daily News (Ohio), "*Wright-Pat nears power breakthrough; Superconducting generator would change air combat*" by Timothy Gaffney;

..."We really think it [an electrical system with a superconducting generator] is a technology that is going to be a game-changer," Erno [Lt. Col. JoAnn Erno, chief of the Power Division in AFRL's Propulsion Directorate.] said last week.

The objective of the Multimegawatt Electric Power System program is to demonstrate a five-megawatt system by the end of 2009. ...

Such a system opens the door to so-called directed energy weapons that need megawatts of electric power, from metal-piercing lasers to electromagnetic beams that can disable weapons or shock troops without killing. ...

Superconductors hold the promise of far smaller, lighter and more efficient electric generators and motors. Researchers around the world have been working on the technology for decades. ...

The 1988 German think tank article cited the problem of electromagnetic pulses' decline in power and precision with distance. The article then described scientifically feasible technology to overcome this problem; "The holographic principle underlying phased-array systems points to a potentiality for treating any desired three-dimensional, electromagnetic field distribution around a target object, from a distance, correcting for reflections, obstacles and other interference."

In addition, the following 1990 article refers to existing technology such as truck size generators available today, specially adapted antenna systems, the lower energy levels required for some weapons and the principle of magnetic field concentration. This technology is capable of battlefield distances of hundreds of meters and 15 km. November 1, 1990, International Review of the Red Cross, "*The Development of New Antipersonnel Weapons*" by Louise Doswald-Beck and Gerald C. Caudey;

Research work in this field has been carried out in almost all industrialized countries, and especially by the great powers, with a view to using these phenomena for anti-materiel or anti-personnel purposes. Tests have demonstrated that powerful microwave pulses could be used as a weapon in order to put the adversary hors de combat or even kill him. It is possible today to generate a very powerful microwave pulse (e.g., between 150 and 3,000 megahertz), with an energy level of several hundreds of megawatts. Using specially adapted antenna systems, these generators could in principle transmit over hundreds of metres sufficient energy to cook a meal.

However it is important to mention that the lethal or incapacitating effects which can be expected from weapon systems using this technology can be produced with much lower energy levels. Using the principle of magnetic field concentration, which permits the control of the geometry on the target, by means of antenna systems especially designed for the purpose, the radiated energy can be concentrated on very small surfaces of the human body, for example the base of the brain where relatively low energy can produce lethal effects.

It seems that with currently available technology, serious consideration could be given to the production of such weapons systems, which could have a range of approximately 15 km and could sweep a zone with a series of fast pulses. Unprotected soldiers within this zone could be put hors de combat or killed within a few seconds.

Such a weapon could be installed on a truck and would therefore be easily transportable.

A 2005 Washington Post article also corroborates Wei's analysis of the need for compact power source and problems with aim and controllable effects of electromagnetic weapons. In addition, the article makes recommendations for serious evaluation of new weapons by policy makers. October 6th 2005, "*National and Homeland Security Microwaves, Lasers, Retired Generals For Sale*" by William M. Arkin;

...The buzz on the floor was "directed energy" laser, high-powered microwaves, and acoustic weapons that are getting a boost from the prolonged fighting in Iraq. ...Highly controversial directed energy weapons have been pushed for almost two decades as the next silver bullet. It's been two decades because along the way, they have run into complications, some having to do

with the technology itself; aim and controllable effects, compact power sources, military ruggedness...

3. Zhijun Wei on detecting brain signals remotely.

The sections in italics were written by Zhijun Wei. The non-italic print was compiled and written by Cheryl Welsh.

Background information.

Unclassified information on the biological basis of consciousness is advancing. The July 1, 2005 Science Magazine included a special section entitled "*What Don't We Know?*" on 125 science questions. "What is the Biological Basis of Consciousness?" is among the first of several questions listed. The article described current research; "So far, however, although theories abound, hard data are sparse." But science writers of journals including the Science Magazine and Scientific American ignore or are unaware of past classified neuroscience and mind control weapons research. The implications of classified research are profound and similar to classified atomic bomb research. Should the biological basis of consciousness be a classified military weapon without any public input? Evidence suggests this is exactly what has happened.

As Dr. Warren McCulloch, a neuropsychiatrist at Massachusetts Institute of Technology, MIT, described below, government agencies were funding and looking for the biological basis of consciousness in the 1950s and the work was controversial. The government's concern for national security priorities of the cold war and the funding of classified programs by eminent scientists of the time is generally overlooked today. As McCulloch described, the work was considered scientifically feasible and promising for military purposes.

'Embodiments of Mind' by Warren S. McCulloch,(1965)MIT Press;

Page 216; Since 1952 Dr. Warren S. McCulloch has been a staff member engaged in the Research Laboratory of Electronics at the Massachusetts Institute of Technology. ..is also well known as one of the founders of the group who have developed Cybernetics. He was Chairman of the Macy Conference on Cybernetics during its life from 1946 to 1951...

"...But Gentleman the title of my paper is not facetious. At the behest of the Mathematical Sciences Division of the Office of Naval Research(ONR), I spent two months abroad, questioning "Where is fancy bred?"

...Percival Bailey, who was one of the first to implant electrodes keeps his copy of the Pope's letter in his desk. In Boston Jim White and Bill Sweet have just been blessed, not merely for implanted electrodes, but...So much for implanted electrodes. They are here to stay. Through them we will record activities in structures heretofore inaccessible, locating the womb of Fancy.

...But the work of Antoine Remond was the crowning success of the meeting. Long years ago he had come to my laboratory in Chicago... combined with accumulators that let him use hundreds of repeated stimulations and so raise the signals way above the noise. The resulting maps of the first special derivative on the surface of the head are impressive.

To go from these to the second derivative, which locates the nervous activity as well as possible, is still done by a laborious longhand computation. ...Today it can be done electronically, ...It may take three years to build the gadgets. Remond's work was so impressive that the National Institutes of Health and the European Office, Air Research and Development Command, are now backing it financially,...

...John Lilly failed to show, and I, as his fellow-American, was commanded to speak on a mathematics suited to neurology.

...Between visits to laboratories and lectures to theoretical physicists, engineers, psychiatrists, and physiologist, I found time to work with Sherwood on the third component of the Laplacian of the cerebral cortex.

...But my principal business in England was the study of artificial intelligence.

...When I reached the National Physical Laboratory for Uttley's symposium on "The Mechanization of Thought Processes," ...But what I saw in Russian faces was that their scientists, like ours, know they are confronted by the problem of the Rabbi of Chelm with his Golem,...

The vigil must be endured, even if it entail "Q" clearance. [Q is a US national security clearance.] ...On the landing here, I made my bow to ONR [Office of Naval Research] and began to contact my Human Factors friends in Astronautics. They could use these circuits.

...Let me recapitulate its discoveries. 1. For the good of patients, implanted electrodes are here to stay; and through them, whether psychiatrists like it or not, we will learn where fancy is bred."

McCulloch was a participant of the Macy Foundation sponsored conferences cited above, a conduit for the CIA funding and research. McCulloch was quoted in the 1991 book, *Cybernetics Group* by Steven Heims, MIT;

Preface; The subject of this book is the series of multidisciplinary conferences, supported by the Macy Foundation and held between 1946 and 1953, to discuss a wide array of topics that eventually came to be called cybernetics.

Pg. 11; ...included several mathematicians (Norbert Wiener, John von Neumann), engineers (Julian Bigelow, Claude Shannon), a neuropsychiatrist (Warren McCulloch), and a polymatic genius (Walter Pitts). Some members of this group had proposed that their concepts useful in engineering and biology,... For lack of a better collective name we shall refer to this group as the cyberneticians, although they would never have used this term themselves.

...Fremont-Smith [of the Josiah Macy Foundation] was so cautious that I got the impression he was anxious to keep something private.

...Much later I learned of the CIA involvement, ...(the Macy Foundation's records have not been open for researchers). At the Macy meetings, as the unedited transcript shows, the political conditions were discussed explicitly from time to time. Some participants were government consultants who worked on "classified" topics kept secret from other researchers; their priorities were such that they skipped attendance at the conferences whenever the government called.

McCulloch described the situation at the beginning of the ninth meeting in 1952; "I would like to say that two things have interfered with our gathering this time. One of those is an increasing source of anxiety to me... Thing after thing that one or another person has wanted to discuss at this meeting has been locked up for "secret." I have no idea how far that process will go in time to come. I know that von Neumann had something he wanted to talk to us about and that it is secret. I know that some stuff that Bavelas wanted to talk about to us has become secret. And so it goes."

Type and strength of brain signals to be detected.

Zhijun referred to the following information on the type and strength of brain signals to be detected.

1. Omni Magazine, February, 1985, '*Mind Fields*', Kathleen McAuliffe;

Jose Delgado, internationally famous neuroscientist...with his spectacular demonstrations showing how behavior can be modified by implanting electrodes in the brains of cats, chimps, even humans. ...Researchers have been able to detect EMFs [electromagnetic fields] in the brain and around the dense network of the body's nerves. The earth itself produces such fields. ...The fields Delgado uses are as low as one fiftieth the strength of the earth's own magnetic fields.

Our body would be subject to a more intense bombardment of energy if you stood under a fluorescent light. Yet when the signal is tuned to precise frequencies(with long wave-lengths in roughly the same range as power-line waves), Delgado can do much more than make a monkey sleepy. ...Remarkably, these EMFs are several hundred times below the voltage needed for an electrode to trigger a nerve to fire.

2. Becker, Robert O., MD '*Crosscurrents*', 1990, St Martin's Press, Page 224;

Since the mid-1970s, Delgado has been director of the premier Spanish neurophysiological laboratory, Centro Ramon y Cajal. ... He has studied the influence of specific frequencies of magnetic fields on the behavior and emotions of monkeys, without using any implanted electrodes or radio receivers. While Delgado did not publish any of this work in the scientific journals, its existence leaked out. In 1984 his lab was visited by a friend of mine, Kathleen McAuliffe, then an editor at Omni magazine.

She was able to observe some of the experiments, and her impressions were subsequently published in the February, 1985 issue of Omni. Using very low-strength ELF magnetic fields, Delgado could deliberately produce either sleep or manic behavior in monkeys. ...McAuliffe was allowed only a peek behind the curtain; most of the questions I had asked her to put to him remain unanswered."

3. *The Body Electric, Electromagnetism and the Foundation of Life* by Robert Becker, M.D., and Gary Selden, William Morrow, N.Y. 1985, Page 240-1;

Then, in 1964, a solid state physicist named Brian D. Josephson invented the electronic device now called the Josephson junction, a simple item that won him the Nobel Prize. Basically it consists of two semiconductors connected so that current can oscillate in a controlled fashion between them. ...This apparatus called a superconducting quantum interferometric device, or SQUID for short, is a magnetic field detector thousands of times more sensitive than any previously known.

...The SQUID has also confirmed the existence of the direct-current perineural system [DC potentials in the nervous system in which small currents from outside could affect brain function, page 85], which, especially in the brain, produces steady DC magnetic fields one billionth the strength of earth's field of about one-half gauss.

Detecting brainwaves among background signals.

The question of detecting the very weak brain signals among background noise is a common scientific problem and is frequently cited as a limitation to remote targeting and tracking of an object by its electromagnetic signal. The following article and others cited by Zhijun Wei below illustrates that this limitation has been addressed in this 1980s research below.

1. Robert Becker, M.D., and Gary Selden, *'The Body Electric, Electromagnetism and the Foundation of Life'*, William Morrow, N.Y. 1985, Page 240-1

By 1975, Drs. Samuel Williamson, Lloyd Kaufman, and Douglas Brenner of NYU had succeeded in measuring the head's field without a shielded enclosure, even amid the electromagnetic noise of downtown Manhattan. More important, they've found that the magnetoencephalogram (MEG) - a recording of changes in the brain's field analogous to the EEG - is often a more accurate reflection of mental activity than the EEG. Because the magnetic field passes right through the dura, skull, bones, and scalp without being diffused, and MEG locates the current source more accurately than EEG measurements. The NYU group has since begun correlating magnetic events with well-known cerebral responses, such as the reaction of cells in the visual cortex to simple patterns and flashes of light.

When the brain reacts to any stimulus, it produces a wave of electrical activity that's contained in the EEG. It's invisible in a standard EEG recording because so much else is always going on in the brain at the same time. However, when one simple stimulus is repeated many times and the EEG tracings are averaged by computer, the particular electrical response to that one stimulus-called an evoked potential-can be tested out.

Several research groups have slowly built up a small vocabulary of wave forms with specific meanings, including a 'surprise wave', an 'intention wave', and a 'double-take wave,' which appears when the mind briefly tries to make sense of somatic nonsense, as in the statement "She took a drink from the radio."

...Since every reaction and thought seems to produce an evoked potential, the DC system seems directly involved in every phase of mental activity. At the very least, the electric sheath acts as a bias control, a sort of background stabilizer that keeps the nerve

impulses flowing in the proper direction and regulates their speed and frequency. But the analog structure probably plays a more active role in the life of the mind. Variations in the current from one place to another in the perineural system apparently form part of every decision, every interpretation, every command, every vacillation, every feeling, and every word of interior monologue, conscious or unconscious, that we conduct in our heads.

No through wall signal detection; new technology challenges this frequently cited scientific roadblock to remote surveillance.

This is a frequently raised technological roadblock against the possibility of human surveillance technology and is included here to illustrate interest and progress in more advanced classified capabilities.

July 7, 2003, Scotsman, 'British troops try out 'James Bond' style X-rayspecs' by Kevin Hurley;

British troops have been carrying out secret tests on a revolutionary new device that allows them to 'see through walls, scientists have revealed. ...It transmits low-frequency radar pulses that can pass through the walls and detect objects and movements. The equipment can see through walls up to nearly a foot thick and the device is being engineered to have a 75 ft range. ...A Ministry of Defense spokeswoman declined to comment on the device. She said: "I am aware of what you are talking about but it is classified information therefore I can't say anything."

Zhijun Wei, in *italics*

From this research spanning over thirty years, one can safely conclude that it is scientifically possible to remotely detect brain signals within a matter of feet but it is very challenging with distance increased, especially from satellite.

Like the light, the intensity of the field decreases in following the inverse-distance law: when the distance doubles, the signal becomes half less strong. This is true in free space but on earth this attenuation is much stronger due to obstacles placed between emitter and receiver and to the fact that traveling around the earth radio waves lost their energy as they forced to bend to follow the earth curvature.

A second effect is related to ground properties. A poor ground (low conductivity and dielectric constant) affects also the wave propagation. A third effect is related to absorption by air. Air is composed of different molecules such as oxygen, nitrogen, water, etc. Those molecules have different absorption rate for electromagnetic waves. The signal level degrades also with distance due to this absorption.

The higher the frequency is, the less energy the ionosphere absorbs. Eventually, the electromagnetic waves will penetrate through the ionosphere and reach the space. However, brain waves are possible to be detected from a distance and then be modulated on a high frequency carrier and transmitted to any place on the earth through satellite system with current technology since the higher frequency signals can penetrate atmosphere and be received by satellite in space. Below are the citations to indicate that brain wave has been detected from a distance.

1. At MIT, however, scientists are studying magnetic brain waves that can produce graphs much like the electrical brain waves now being measured. Scientists for the research agency say it may be possible to pick up magnetic waves a foot or two from the subject's head, perhaps by placing a receiver in the back of a chair.

Could these waves be projected over distances greater than a few feet?

"We are now talking about a foot or several feet," one scientist said. "But the research agency has a pretty good idea of what it could be doing in the 1980s. Los Angeles Times, March 29th 1976, Mind Reading Machine Tells Secrets of the Brain Sci-Fi Comes True, Norman Kempster.

2. "Scientists have developed a sensor that can record brainwaves without the need for electrodes to be inserted into the brain or even placed on the scalp." BBC News, Remote control brain sensor, November 17, 2002 <http://news.bbc.co.uk/2/hi/health/2361987.stm>
3. By 1975, Dr. Samuel Williamson, Loyd Kaufman, and Douglas Brenner of NYU had succeeded in measuring the head's field without a shielded enclosure, even amid the electromagnetic noise of downtown Manhattan. *The Body Electric, Electromagnetism and the Foundation of Life* Robert Becker, M.D., and Gary Selden, William Morrow, N.Y. 1985, Page 240-1

As for modulation and transmission from ground station, it has been already proved by existing communication systems like XM satellite radio [Ashley Fantz, "XM Satellite Radio Innovation Center tests limits", Sacramento Bee, August 23, 2004, "The 51-year-old product designer with a doctorate in electrical engineering spent nearly two decades at Motorola, creating the company's first cellular phones... And more intriguing, to configure a way to get two massive satellites -one call Rock, the other Roll- to beam scores of CD-quality radio channels to customers' cars and homes. ...the firm began broadcasting...], GSM & CDMA mobile phone systems, etc.

Directly detecting weak ELF signals on ground from space is becoming reality at this time. One of example is a very small satellite, aptly named QuakeSat and launched in 2003, which will provide ELF earthquake precursor signals from space. It collects the refracted ELF waves in the ionosphere, which propagate along the Earth's magnetic field lines. QuakeSat will use permanent magnets for passive attitude control to orient the QuakeSat close to the magnetic field line. A 0.701 m deployable payload boom contains the commandable ELF magnetometer, which collects raw ELF data. For more info see http://www.quakefinder.com/SSC_PAPER_SSC02-IX-6.pdf

As it is mentioned above that the signal level of brain waves is a million times weaker than that of the earth magnetic fields, the direct detection of brain wave from space is thus very challenging and difficult with today's technology due to a matter of signal and noises. (quote from confidential emailed file, Nasa scientist, [While theoretically possible, [to detect brain waves from a satellite], this must remain in the "very challenging" category.]

Another example is the detection of Ocean's magnetic fields by satellite. Research in the current issue of the journal science has shown for the first time that the ocean's magnetic fields can be detected via satellite. The research also raises the potential to use the oceans' magnetic fields as a means of tracking large-scale ocean circulation patterns. [Christian Science Monitor, January 16, 2003, "New Light on a dark patch of cosmic history" by Peter N. Spotts. "...These fields are weak-on the order of one-thousandth of Earth's magnetic field."]

It is seen that brain waves are extreme low frequencies (0 - 3kHz). Practically, ELF are only used by some submarines and to carry AC over power lines. Measurements of ELF electric and magnetic fields are performed in order to characterize emissions from sources and exposure of persons or experimental subjects. The strength of the electric field is measured in units of volts per metre (V/m). The strength of the magnetic field is measured in units of amperes per metre (A/m) but is usually expressed in terms of the magnetic flux density measured in units of tesla (T) or microtesla (mT). Another unit, which is commonly used to measure the magnetic field is the gauss (G) or milligauss (mG), where 1 G is equivalent to 10^{-4} T (or 1 mG = 0.1 T).

The electromagnetic waves with free space wavelength longer than 200m or frequency below 1500kHz tend to propagate along the surface of the earth. In other words, it is called ground waves. Ground waves travel between two limits, the earth and the ionosphere, which acts like a duct. Since the duct curves with the earth, the ground wave will follow. The earth is rounded so there will be resonance, called the Schumann resonances with peaks at frequencies between 8 and 32 Hz. Their electric components are around 0.01V/m, with magnetic fields of 1-10nT. This may contrast with the earth's much larger static geomagnetic field around 50 μ T (0.5 gauss).

LF electric and magnetic fields can be produced by other natural and artificial sources. Naturally occurring ELF fields can be associated with atmospheric processes such as ionospheric currents, thunderstorms and lightning. Artificial sources are the dominant sources of ELF fields and are usually associated with the generation, distribution and use of electricity at the frequency of 50 or 60 Hz. Powerlines, electrical wiring and common appliances (electric blankets, televisions, hair-dryers, computers, etc.) all produce ELF electric and magnetic fields.

Electric fields around most household appliances and equipment typically do not exceed 500 V/m and magnetic fields typically do not exceed 150 μ T (1500mG). Within generating stations and substations electric fields are in excess of 25 kV/m and magnetic fields in excess of 2 mT (20,000 mG) may be found. These signal levels are much greater than that of biomagnetic activities. The signal level of biomagnetic activity ranges from fT to nT. However, the signal level of brain wave changes with the state of brain. But it is still at least a million times weaker than the earth magnetic field.

Due to the time limitation, this report does not differentiate magnetic issues from ELF issues.

4. Feasibility of remote targeting of humans via satellite by Zhijun Wei.

Technology for targeting a human within several feet compiled by Cheryl Welsh.

What type of signal may be most effective on the human body? Zhijun Wei referred to the following articles for signal parameters for targeting a human being.

"Adey's research suggests that the best way to get an ELF signal into an animal is to make it a pulse modulation of a high-frequency radio signal." "The Body Electric" by Becker, Robert O. MD and Seldin, Gary, 1985, page 325.

November 1, 1990, International Review of the Red Cross, "*The Development of New Antipersonnel Weapons*" by Louise Doswald-Beck and Gerald C. Cauderay,

However it is important to mention that the lethal or incapacitating effects which can be expected from weapon systems using this technology can be produce with much lower energy levels. Using the principle of magnetic field concentration, which permits the control of the geometry on the target, by means of antenna systems especially designed for the purpose, the radiated energy can be concentrated on very small surfaces of the human body, for example the base of the brain where relatively low energy can produce lethal effects.

...Research work has also revealed that pathological effects close to those induced by highly toxic substances could be produced by electromagnetic radiation even at very low power, especially those using a pulse shape containing a large number of different frequencies.

...Some research seem to have confirmed that low-level electromagnetic fields, modulated to be similar to normal brainwaves, could seriously affect brain function. Experiments with pulsed magnetic fields carried out in animals have reportedly produced specific effects such as inducing sleep and triggering anxiety or aggressiveness, depending on the modulation of the frequency used.

It is, on the other hand, well known that lethal effects can also be produced by using higher power levels than those used for the experiments on behavior modification. An anti-personnel weapon based on such biophysical principles could produce similar effects to those of a nerve gas, but would have no secondary effects and leave no lasting trace.

Zhijun Wei comments in *italics*.

There have been reported stories [scientific articles cited above] about remote targeting of human being from a far distance. From those stories, it is evident that targeting human being from a far distance is realizable with current technology. But it is questionable that this can be done from a satellite.

Among them, the Washington Post reported that the soviets might be close to a prototype short-range tactical RF weapon and they had used such weapons to kill goats at 1 kilometer's range in 1987.

Tests have demonstrated that powerful microwave pulses could be used as a weapon in order to put the adversary hors de combat or even kill him. It is possible today to generate a very powerful microwave pulse (e.g., between 150 and 3,000 megahertz), with an energy level of several hundreds of megawatts. Using specially adapted antenna systems, these generators could in principle transmit over hundred metres sufficient energy to cook a meal. (International Review of the Red Cross, November 1, 1990, Louise Doswald-Beck and Gerald C. Cauderay, The Development of New Antipersonnel Weapons)

However, remote targeting a human being from satellite is technically extremely challenging although it is theoretically sound. Due to availability of literature and classified material on this topic, the report only covers the development of related technologies which may be used to fulfill this purpose.

It is obvious that satellite has to have a super high power source because the target is thousands of kilometers away. In addition to that, there is significant attenuation of microwave signals along the path. High resolution antenna is another important component in satellite targeting due to its small interference.

Technology and terminology by Zhijun Wei.

Satellite communication

Satellite communication systems have become instrumental in allowing information to be accessed more easily throughout world. Satellite signals are able to link many users simultaneously throughout a large geographical area or provide communication to remote communities. Many facets of our daily lives are controlled by satellite communications as most television and many telephone signals are relayed across the world by numerous satellite systems.

The main components of a satellite communications system consist of a transmitting earth station, a satellite acting as a relay or repeater station, and a receiving earth station. The information is first encoded electronically, modulated onto high frequency electromagnetic waves and then sent through the satellite communications system. These waves, known as microwave, have frequencies in excess of one billion cycles per second, or 1GHz. Microwave frequencies are used to transmit information in this system for five distinct reasons. Firstly, higher frequency electromagnetic waves have the potential for relaying larger quantities of

information because as the frequency increases, any bandwidth around a center frequency becomes a smaller fraction of that operating frequency.

Secondly, due to the requirement that uplink antennas be able to aim a highly directional beam towards an extremely small target in space, EM waves can be better focused by an antenna substantially larger than the wavelength of the radiation it is managing. Thirdly, Microwave transmissions to satellites or between earth-based line of sight relay stations are not as susceptible to noise from atmospheric disturbances as are lower frequency transmissions. Finally, most important is the ability of microwave frequencies to pass through the upper atmosphere in outer space.

Radar

A radar's function is to send out a beam or pulse of microwave energy and receive some of that energy scattered back from an object. When a radar's radiation hits the target. It is scattered or absorbed by that object. Fortunately, microwave radiation, for the most part, is not totally absorbed by the object. What proportion of that scattering is returned to the radar is called the reflectivity value. Below are the paragraphs briefly summarizing the basic theory behind scattering?

There are two basic scattering: Rayleigh and Mie scattering. Rayleigh scattering is a theory that describes scattering characteristics that are smaller than the wavelength of radiation that they encounter. Objects of this size do not scatter all wavelengths evenly. Alternately, Mie scatterers are larger in size and are able to scatter ALL wavelengths in all directions.

Phased array antenna

A phased-array antenna consists of an assemblage of many individually controlled emitting (or receiving) elements, placed in a fixed geometrical arrangement. The output field of the array is the sum of the waves emitted by the individual elements. By electronically controlling the relative phases of these individual signals, the output field can be given any desired "shape" and direction, limited only by the wavelength use, the number of elements and the size of the array.

Signal shapes

Here just list three periodic signal shapes, which are often used in electronic systems. They are sine wave, square wave, and sawtooth wave. These three signal shapes are always described by amplitude and frequency. The amplitude is merely the maximum displacement of the signal from zero. The frequency with which a signal repeats itself is measured in cycles per second (cps), more familiarly known as hertz (Hz). Sine wave is a smooth waveform whose spectrum consists of a single frequency. Square wave is a rectangular waveform that alternates between a positive value and a negative value. Its frequency spectrum includes all of the odd harmonics and has higher harmonic content than a triangle wave. The sawtooth wave is a waveform consisting of a periodic ramp. Its frequency spectrum includes all of the odd and even harmonics.

Electroencephalogram (EEG) signal

The summation of the electrical activity caused by the random firing of billions of individual neurons in the brain is represented by the EEG signal. A typical bandwidth of this type of EEG ranges from 0.5 to about 100Hz, with the amplitudes ranging from 2 to 100mV. Five different states or types of brainwaves have been characterized by neurologists. They are gamma, beta, alpha, theta and delta.

Brain waves

Brainwave (neurophysiology) is defined as rapid fluctuations of voltage between parts of the cerebral cortex that are detectable with an electroencephalograph.

For further information;

Monmonier, Mark, "Spying with Maps: surveillance technologies and the future of privacy", 2002, University of Chicago Press. Discusses various new surveillance technologies.

Purcell, Edward M., Electricity and Magnetism, New York : McGraw-Hill, 1985. A great book for those who want to pursue the physics of E&M.

Zhijun Wei made the following final conclusions.

"It is scientifically possible to remotely detect brain signals within a matter of feet but it is very challenging with distance increased, especially from satellite."

"Brain waves are possible to be detected from a distance and then be modulated on a high frequency carrier and transmitted to any place on the earth through satellite system with current technology since the higher frequency signals can penetrate atmosphere and be received by satellite in space."

"From those stories, [scientific articles listed in report], it is evident that targeting human being from a far distance is realizable with current technology. But it is questionable that this can be done from a satellite."

The remainder of the report has been compiled and analyzed by Cheryl Welsh.

5. Satellite surveillance technology; extremely advanced, classified and well-funded since 1940s.

Since human surveillance capabilities as a national security priority are rarely reported by the press, evidence is provided here. As seen in the following 1976 and 1990 articles, the publicly known science of remote human surveillance is sparse, controlled by the military and is being developed for weapons use in extremely classified programs.

Zhijun Wei cited this article describing classified military research and remote detection (necessary for remote surveillance) of brain waves for brain reading. Los Angeles Times, March 29th 1976, Mind Reading Machine Tells Secrets of the Brain Sci-Fi Comes True, Norman Kempster.

George H. Heilmeier, director of the [DARPA, Defense Advanced Research Projects Agency] research agency, dropped tantalizing hints about the EEG program in his annual report to Congress. Although he has provided few details,...

At MIT, however, scientists are studying magnetic brain waves that can produce graphs much like the electrical brain waves now being measured.

Scientists for the research agency say it may be possible to pick up magnetic waves a foot or two from the subject's head, perhaps by placing a receiver in the back of a chair. Could these waves be projected over distances greater than a few feet?

"We are now talking about a foot or several feet," one scientist said. "But the research agency has a pretty good idea of what it could be doing in the 1980s."

The very few, subsequent articles to the 1976 Los Angeles Times article report similar classified military research on remote human surveillance and targeting. As cited several times above, November 1, 1990, International Review of the Red Cross 279, "The Development of New Antipersonnel Weapons" by Louise Doswald-Beck and Gerald C. Cauderay;

Research work in this field has been carried out in almost all industrialized countries, and especially by the great powers, with a view to using these phenomena for anti-materiel or anti-personnel purposes. Tests have demonstrated that powerful microwave pulses could be used as a weapon in order to put the adversary hors de combat or even kill him. It is possible today to generate a very powerful microwave pulse (e.g., between 150 and 3,000 megahertz), with an energy level of several hundreds of megawatts. Using specially adapted antenna systems, these generators could in principle transmit over hundreds of metres sufficient energy to cook a meal.

...In spite of the rarity of publications on this subject, and the fact that it is usually strictly classified information, research undertaken in this field seems to have demonstrated that very small amounts of electromagnetic radiation could appreciably alter the functions of living cells.

Like mind control research, human surveillance capabilities are surrounded in ethical controversy and privacy concerns. Unlike mind control, much less public research on human surveillance has been conducted. Given national security priorities, whether developed now or in the future, human surveillance would be a very classified area of research. The Los Angeles Times and the International Review of the Red Cross articles confirm that classified human surveillance capabilities have been developed. An educated guess is that sophisticated mind control and remote human surveillance may already be extremely advanced.

Background information on satellite surveillance; technological problems and breakthroughs.

Satellite surveillance technologies have a long history of development, are one of the deepest secrets of the nation and have enjoyed billion dollar budgets. A December 9th 2004, Sacramento Bee article entitled '*Four Senators criticize mysterious spy program*', described a program "almost certainly a spy satellite system, perhaps with technology to destroy potential attackers with 'enormous expense and alleged danger to national security.'" James Bamford commented "In the intelligence community, it's so hard to get a handle on what's going on, particularly with the satellite programs." Another expert agreed "It's hard to think of most any satellite program, at least the standard ones, as dangerous to national security," said Jeffrey Richelson, who wrote a highly regarded book about CIA technology in 2001."

The 2001 Richelson book is quoted below to show examples of detecting extremely weak signals from space. How advanced this technology is, cannot be determined because the technology is so highly classified, funded and regulated by the government. The capability of technologies to detect and target the brain would seem to be, by analogy the same technology for detecting weak signals of moving targets and targeting weak signals towards a moving target.

The Richelson book illustrates how advanced and well funded the very related technologies were and how previously unknown capabilities were developed by eminent US scientists, including William Perry, former U.S. Secretary of Defense.

Tracking and targeting human brain signals may seem like science fiction, but when the problem is reduced to categories such as extremely weak signal detection and signal to noise issues, the science becomes feasible, although extremely daunting from this vantage point. William Perry and others accomplished major scientific breakthroughs including the signal to noise problem encountered with the development of spy satellites. And as seen below in research to gather extremely weak soviet radar signals reflected from the moon, government agencies were willing to go to extreme technological lengths for national security purposes.

'*Wizards of Langley*' by Richelson, Jeffrey, 2001;

Page 107; Not long after becoming head of the DS&T, Wheelon was reading a story in the New York Herald Tribune about Syncom, A NASA-DOD-Hughes satellite program. The article discussed what was then a revolutionary means of communications, ...that allowed communication from a ground station to a satellite and then back down to another ground station. ...they [satellites] flew 22,300 miles above various points on the equator, in geostationary orbit.

...It occurred to Wheelon that it might be possible to employ such an approach to intercept signals from key targets and relay them to a U.S. ground station. ...Wheelon assembled some key CIA officials to explore such ideas...

An initial concern was whether such a program was feasible.

Because the telemetry signals were transmitted at very-high and ultra-high frequencies (VHF and UHF), they would not bounce off the atmosphere, as high-frequency communications did, but leak out into space where the satellites would be waiting to scoop them up. But it was feared that the noise from other, and unwanted, transmissions such as television signals would drown the telemetry in an ocean of noise. ...Before proceeding further, Wheelon asked William Perry, who had just left Sylvania's Electronic Defense Laboratories to form his own company, to study the matter.

Six months later, he reported that the idea was workable.

Perry's work in determining the feasibility of such a satellite would be a key, although unspecified, reason for his winning the CIA's R. V. Jones Award-named after the British physicist who headed the British Secret Intelligence Service's scientific intelligence effort in World War II.

When presented with the idea, both McCone and Carter were supportive, and Lauderdale was tapped as manager of the new program, which was named Rhyolite. ...Lauderdale would become the key figure in transforming the idea into a reality-arriving at work one day with a working model of a French umbrella antenna, which would also serve as model for the Rhyolite antenna.

Page 37; Rather than relying on aircraft or eavesdropping antennae, the project employed an

over-the-horizon (OTH) radar to monitor Soviet missile tests. Such radars use the ionosphere as a reflector for high-frequency radio energy and therefore are not limited to the "line-of-sight" restrictions of conventional ground-based radars. OTH radars promised to provide information on missile and aircraft activity up to 3,100 miles away-by bouncing a radio signal off the ionosphere and onto the target and receiving the reflected signal. The technology has been tested by the CIA, which, along with the Office of Naval Research, shared a U.S.-based radar facility code-named Chapel Bell.

Page 89; In 1965 and 1966, while Kirkenes, Beshahr, and Kabkan were listening to Soviet missile tests, another CIA facility was listening for signals from the moon. Out at Stanford University in Palo Alto, California, the CIA was employing a 150-foot dish antenna to monitor the signals of Soviet radars after they had bounced off the earth's only natural satellite.

The "moonbounce" phenomenon had been discovered in 1946, when scientists detected a man-made signal reflected from the moon.

Experiments that followed revealed the extraordinary weakness of such signals. A typical signal received via moonbounce was a billion times weaker than if it were intercepted by an airplane ten miles from the transmitter.

As a result, only very large antennae could effectively hear such signals and distinguish them from other signals.

By the early 1960s, the possibility of exploiting the moonbounce phenomenon was being investigated by a number of agencies. N.C. Gerson of the National Security Agency used the Arecibo Ionospheric Observatory in Puerto Rico to intercept moonbounce signals from a Soviet radar operating on the Arctic coast.

Along with a member of the Army Security Agency, he produced a three-volume study-Moonbounce Potential from Scooped Antennas. The Air Force also had a moonbounce project, FLOWER GARDEN, which relied on several antennae, including the 250-foot antenna at Jodrell Bank. Other moonbounce collectors were the antennae at the Grand Bahama tracking station, a Navy intercept site at Sugar Grove, West Virginia, and the Naval Research Laboratory's Chesapeake Bay Annex."

Secrecy and satellite remote sensing.

Since the 1940s, remote sensing has been among the deepest secrets of the nation. In a fascinating account, Dr. Cloud explained how one of the highest levels of secret research was carried out with the intent of remaining secret forever. *Cartography and Geographic Information Science*, Vol. 29, No.3 2002, '*American Cartographic Transformations during the Cold War*' by John Cloud;

Page 264; For Leghorn, that left two stances against the Soviet Union, based on the assumption that the Soviet Union would eventually have nuclear weapons as well. The first was mutual forbearance and negotiated peace as an alternative to mutually assured destruction, the policy in force to the present day. The second was to remove the enemy in a pre-emptive nuclear strike. Both options would require superb reconnaissance. [In 1946], Leghorn noted "for these reasons it is extraordinarily important that means of long-range aerial reconnaissance be devised that cannot be detected". Hence even seemingly innocuous vegetation studies might remain classified in order to conceal sensor capabilities.

Both Katz and Leghorn spent their professional lives involved in the dualities of secrecy and disclosure inherent in observations systems that are vital, yet cannot be detected and should never be revealed. ...In 1949, Katz and Leghorn were named to a committee to "conduct a survey of the electro-magnetic spectrum from the point of view of its applicability to reconnaissance.

Page 267; But the photogrammetry that would eventually provide the extension of this geodetic control was to be based on imagery from systems "that cannot be detected," in Leghorn's words (1946). And so it was that the convergence of geodesy, photogrammetry, and cartography at the heart of this story took place at the highest levels of secrecy in the history of the United States.

...Through several decades of "black" programs, the CIA devised a methodology for developing

overhead imagery sensors and their allied technologies.

"Black" programs encompass many endeavors, but for this discussion the important point is that CIA imagery acquisition programs involved small numbers of sole-source contractors cleared into top-secret codeword compartmentalized security domains and paid in unaccountable funds issued directly from the Directorate of Central Intelligence (DCI).

The model began in the early 1950s with the Genetrix program, which used experimental high-altitude reconnaissance cameras mounted in stratospheric balloons. Then came project Aquatone, better known as the U-2, the first in a series of high performance, high-altitude reconnaissance planes built in the middle 1950s. The imagery associated with these sensor platforms was ordered under some of the most restricted security protocols ever devised—a set of protocols originally called Talent.

Reconnaissance then went into orbit with a series of satellite-borne imagery systems, starting in 1958 with Corona, the foundational global remote sensing system and continuing to the present. Space-borne reconnaissance was ordered under a new set of Keyhole protocols. Later these were combined into the Talent-Keyhole security protocol system covering all overhead reconnaissance, which survives to the present day.

Page 269; The combination of the new sensor systems and their applications, especially over hostile territory, induced another major structural distinction between the operational roles of the Air Force and Army in data acquisition and reduction. The data collection systems included some of the most important and closely guarded national secrets, while the data reduction and mapping systems remained largely unclassified. The combinations of secret data and unclassified data management systems created tensions, required subterfuge, and ultimately triggered important and unintended consequences that changed the course of American cartography.

Page 274; Nominally civilian federal agencies were integrated into the classified infrastructure by quietly acquiring their own classified labs, so that they could use intelligence and classified materials. The first building at the new USGS National Mapping Division complex at Reston, Virginia, was Building E-1— a Talent-Keyhole-level, secure, compartmentalized intelligence facility (SCIF). Inside Building E-1, USGS civilian personnel had access to U-2 and SR-71 aerial reconnaissance photography as well as Corona film from space.

The Geological Survey has been mapping the nation with top-secret intelligence assets for a third of a century, although none of this was ever publicly acknowledged until the declassification of Corona. Nevertheless, USGS maps have hinted at these developments. Starting in the late 1960s, the photo-revised USGS 7.5 minute quadrangles have noted, in their legends, that the photo-revisions are based on "aerial photography and other source data". The "other source data" were and remain the deepest secrets of the nation."

6. Remote sensing of humans is a 2003 goal of U.S. Special Operations Command.

One of the rare times this goal has been cited. Surreptitious human surveillance is classified and controversial. National Defense Industrial Association, May 1, 2003, National Defense No. 594, Vol. 87, *'Special operators seeking a technological advantage, U.S. Special Operations Command'* by Harold Kennedy;

The U.S. Special Operations Command is looking for 'leap-ahead' technologies that can give its troops a decided advantage over their adversaries in wars such as those in Iraq and Afghanistan.

...Signature reduction. Technologies must enable significant reductions in the signatures of the special operator and his equipment, including air, land and sea-based platforms, Wattenbarger said.

Signatures are distinctive patterns or characteristics by which something can be recognized. They can involve visual, aural, olfactory, seismic, electromagnetic, laser, infrared or radio frequency signals. Projects underway include a vehicle camouflage system; a small, versatile,

maritime mobility craft, and active noise cancellation.

...Remote sensing. Sensors must be capable of detecting electronic transmission, seismic, acoustical, infrared, electro-optic, electromagnetic and radio frequency signatures--the physical presence--of target individuals and groups, ...

National Security Archive, Electronic Briefing Book, No. 35 at <http://www2.gwu.edu/~nsarchiv/NSAEBB/NSAEBB35/>

The NRO Declassified. In September 1992 the Department of Defense acknowledged the existence of the National Reconnaissance Office (NRO), an agency established in 1961 to manage the development and operation of the nation's reconnaissance satellite systems. The creation of the NRO was the result of a number of factors.

...*Defining the Future of the NRO for the 21st Century, Final Report, Executive Summary* August 26, 1996 Unclassified 30 pp.

This report was apparently the first major outside review of the NRO conducted during the Clinton administration, and the first conducted after the NRO's transformation to an overt institution and its restructuring were firmly in place.

Among those conducting the review were former Vice Chairman of the Joint Chiefs of Staff, Adm. David E. Jeremiah, former NRO director Martin Faga, and former Deputy Director of Central Intelligence John McMahon. Issues studied by the panel included, inter alia, the existence of a possible alternative to the NRO, NRO's mission in the 21st Century, support to military operations, security, internal organization, and the relationship with NRO's customers.

After reviewing a number of alternatives, the panel concluded that no other arrangement was superior for carrying out the NRO mission. It did, however, recommend, changes with regards to NRO's mission and internal organization. The panel concluded that where the NRO's current mission is 'worldwide intelligence,' its future mission should be 'global information superiority,' which "demands intelligence capabilities unimaginable just a few years ago."

The panel also recommended creation of a fourth NRO directorate, which was subsequently established, to focus solely on the development of advanced systems, in order to "increase the visibility and stature of technology innovation in the NRO."

7. Sophisticated remote mind control capabilities are classified and controversial. How advanced the capabilities is not known but powerful battlefield and mind control weapons are scientifically feasible today.

Comparing Delgado's 1969 research cited below to the science of the 1976 article and to a 2003 article below, mind control seems to be promising research. The obvious question is why more progress not been made since 1969. An educated guess is that a large portion of mind control research is classified.

Physical Control of the Mind: Toward a Psychocivilized Society, Yale University, by Jose, M.R. Delgado MD., 1969;

A new technology ... methodology has proved that movements, sensations, emotions, desires, ideas, and a variety of psychological phenomena may be induced, inhibited, or modified by electrical stimulation of specific areas of the brain.

Page 81; Also, several investigators have learned to identify patterns of electrical activity (which a computer could also recognize) localized in specific areas of the brain and related to determined phenomena such as perception of smells or visual perception of edges and movements. We are advancing rapidly in the pattern recognition of electrical correlates of behavior and in the methodology for two-way radio communication between brain and computers.

March 29th 1976, Los Angeles Times, Mind Reading Machine Tells Secrets of the Brain. Sci-Fi Comes True, by Norman Kempster;

...George H. Heilmeier, director of the research agency, dropped tantalizing hints about the EEG program in his annual report to Congress.

...For one thing, the EEG must be individually calibrated. Brain-wave graphs mean different things for different persons. So it is necessary to obtain a baseline graph by having each individual think a specific series of thoughts.

"It is quick and easy to make the calibration but it must be done for each individual." one scientist explained.

October 11, 2003, San Francisco Chronicle, 'Devices *that read human thought now possible, study says brain implants could help severely disabled*' by Carl T. Hall;

...[Dr. Miguel A.L. Nicolelis of Duke University] and others discussed their latest findings at the annual meeting in New Orleans of the Society for Neuroscience, the world's largest gathering of brain researchers. ...In the latest studies on people, Nicolelis' Duke group had to use a simplified version of the animal study protocol to stay within the bounds of a five-minute surgical window. But that was still enough, Nicolelis said, to show animal and human brains can be read much in the same way. "We are showing the same computational algorithms work, the same technology in general works,..."

8. New research on targeting the brain indicates electromagnetic brain communication is a scientifically valid theory.

The widespread cover story is that russian mind control doesn't work or that no US mind control program exists. For example, Defense News, December 17-23 2001, Israel Fields Means to Suppress Palestinian Violence by Louise Doswald-Beck;

...In a Dec. 9 interview marking the close of his four-year term at the helm of Israel's formidable defense research and development sector, Ben-Israel, [Major General Isaac Ben-Israel] said his directorate explored different scientific and phenomenological fields-including mind control- in attempts to contain and deter terrorist activity. "We invested in this for a few years...but we determined that it was not effective," Ben-Israel said of mind control methods, many of which were developed by military and security agencies of the former Soviet Union.

And yet numerous articles for several decades describe government funding and interest in electromagnetic 'mind control' technology that does work or is scientifically feasible. See www.mindjustice.org.

The CNN news broadcast, Special Assignment by Chuck DeCaro, "Weapons of War, Is there an RF Gap?", November 1985 demonstrated Soviet mind control technology that worked. Dr. Bill van Bise, electrical engineer, conducting a demonstration of Soviet scientific data and schematics for beaming a magnetic field into the brain to cause visual hallucinations. The demonstration on reporter Chuck DeCaro was successful. Dr. van Bise stated, "In three weeks, I could put together a device [weapon] that would take care of a whole town." Reporter Chuck DeCaro was blindfolded and his ears were blocked for sound in an experiment using Soviet specifications for equipment capable of generating specific but very weak magnetic signals designed to cause visual 'hallucinations'. DeCaro stated "A parabola just went by.. I could see wave forms changing shape as they went by."

But after decades of research why is there so little progress in mind control technology? With a closer examination, a pattern of government control of the development and funding of electromagnetic mind control research emerges.

In spite of the decades of research and interest, only the most basic 'mind control' technologies are ever discussed in the unclassified literature. As noted in the 1976 Los Angeles Times article on reading thoughts via brainwaves, the classified research in this area included research for military purposes. Reading thoughts via brainwaves has not advanced since the 1976 Los Angeles Times article reported that an EEG or brainwave signals can determine whether someone is fatigued, puzzled or daydreaming, how someone perceives colors and shapes and tell the difference between a 'right' answer based on knowledge and one that was merely a lucky guess.

Here is another example. After many decades, the same rudimentary mind control technology that targets the human nervous system is repeatedly 'in development'. The unclassified weapons stun, disorient or immobilize. After many decades, electromagnetic weapons are known to be extremely classified but how sophisticated or well developed is impossible to determine. What is known is that after decades of research, the science of electromagnetic mind control continues to remain well funded and scientifically feasible.

Here is 2005 article and example of how government control of research and funding has allowed only rudimentary mind control technologies in the public eye while government electromagnetic mind control research has remained classified for several decades. The following October 2005 article describes very elementary electromagnetic technology for video games and then describes military interest, funding and research of this technology. Sophisticated electromagnetic mind control weapons of extreme importance to national security are a likely explanation for this decades old pattern of classified electromagnetic weapons and the concurrent development and lack of progress with unclassified electromagnetic mind control technologies.

In the AP article "Remote Control Device 'Controls' Humans" by Yuri Kageyama, Oct 27, 2005 9:08 PM US/ Eastern, the reporter said this electromagnetic technology works in spite of your resistance to the electromagnetic field. "Nippon Telegraph & Telephone Corp., Japan's top telephone company, says it is developing the technology to perhaps make video games more realistic. ...The technology is called galvanic vestibular stimulation-essentially, electricity messes with the delicate nerves inside the ear that help maintain balance. ...Another program had the electric current timed to music. My head was pulsating against my will, getting jerked around on my neck. I became so dizzy I could barely stand.

In addition, the article stated; "Timothy Hullar, assistant professor at the Washington University School of Medicine in St. Louis, Mo., believes finding the right way to deliver an electromagnetic field to the ear at a distance could turn the technology into a weapon for situations where "killing isn't the best solution. "This would be the most logical situation for a nonlethal weapon that presumably would make your opponent dizzy," he said via e-mail. "If you find just the right frequency, energy, duration of application, you would hope to find something that doesn't permanently injure someone but would allow you to make someone temporarily off-balance."

The article continues, "Indeed, a small defense contractor in Texas, Invocon Inc., is exploring whether precisely tuned electromagnetic pulses could be safely fired into people's ears to temporarily subdue them." The reporter concluded: "...from my experience, if the currents persist, you'd probably be persuaded to follow their orders."

The patent described below is scientifically feasible, scientists say but the technology has not been developed. April 7, 2005, New Scientist, Sony patent takes first step towards real-life Matrix by Jenny Hogan and Barry Fox. Print Edition posted here; [newscientist.com/article.ns?id=mg18624944.600](http://www.newscientist.com/article.ns?id=mg18624944.600)

Imagine movies and computer games in which you get to smell, taste and perhaps even feel things. That's the tantalizing prospect raised by a patent on a device for transmitting sensory data directly into the human brain - granted to none other than the entertainment giant Sony.

The technique suggested in the patent is entirely non-invasive. It describes a device that fires pulses of ultrasound at the head to modify firing patterns in targeted parts of the brain, creating "sensory experiences" ranging from moving images to tastes and sounds. This could give blind or deaf people the chance to see or hear, the patent claims.

While brain implants are becoming increasingly sophisticated, the only non-invasive ways of manipulating the brain remain crude. A technique known as transcranial magnetic stimulation can activate nerves by using rapidly changing magnetic fields to induce currents in brain tissue. However, magnetic fields cannot be finely focused on small groups of brain cells, whereas ultrasound could be.

If the method described by Sony really does work, it could have all sorts of uses in research and medicine, even if it is not capable of evoking sensory experiences detailed enough for the entertainment purposes envisaged in the patent. "This was a prophetic invention. It was based on an inspiration that this may someday be the direction technology takes us"

Details are sparse, and Sony declined New Scientist's request for an interview with the inventor, who is based in its offices in San Diego, California. However, independent experts are not dismissing the idea out of hand. "I looked at it and found it plausible," says Niels Birbaumer, a pioneering neuroscientist at the University of Tübingen in Germany who has created devices that

let people control devices via brain waves.

The application contains references to two scientific papers presenting research that could underpin the device. One, in an echo of Galvani's classic 18th-century experiments on frogs' legs that proved electricity can trigger nerve impulses, showed that certain kinds of ultrasound pulses can affect the excitability of nerves from a frog's leg. The author, Richard Mihran of the University of Colorado, Boulder, had no knowledge of the patent until New Scientist contacted him, but says he would be concerned about the proposed method's long-term safety.

Sony first submitted a patent application for the ultrasound method in 2000, which was granted in March 2003. Since then Sony has filed a series of continuations, most recently in December 2004 (US 2004/267118).

Elizabeth Boukis, spokeswoman for Sony Electronics, says the work is speculative. "There were not any experiments done," she says. "This particular patent was a prophetic invention. It was based on an inspiration that this may someday be the direction that technology will take us."

Susan Saylor deserves a special mention for finding and posting the Sony patent. Here are excerpts.

United States Patent 6,536,440 Dawson March 25, 2003

Method and system for generating sensory data onto the human neural cortex

Abstract

A non-invasive system and process for projecting sensory data onto the human neural cortex is provided. The system includes a primary transducer array and a secondary transducer array. The primary transducer array acts as a coherent signal source, and the secondary transducer array acts as a controllable diffraction pattern that focuses energy onto the neural cortex in a desired pattern. In addition, the pattern of energy is constructed such that each portion projected into the neural cortex may be individually pulsed at low frequency. This low frequency pulsing is formed by controlling the phase differences between the emitted energy of the elements of primary and secondary transducer arrays.

Parent Case Text

CROSS REFERENCE TO RELATED APPLICATIONS

The present Application is related to the U.S. patent application entitled "Method And System For Forming An Acoustic Signal From Neural Timing Difference Data," Ser. No. 09/690,786, co-filed with the present application on even date, and assigned to the Assignee of the present invention, and is hereby incorporated by reference in its entirety.

Claims

...Low frequency amplitude modulation combined with wavelength phase interactions from the primary and secondary transducer arrays 200, 202 form a stimulus to activate neurons in the visual cortex area 100 or another other part of the human neural cortex. By controlling the pattern of signal amplitude and phase shifts in secondary array 202, a wide range of patterns can be focused towards visual cortex 100 or any other region of the human cortex. Ultrasonic signals altering neural firings are discussed in "Temporally-specific modification of myelinated axon excitability in vitro following a single ultrasound pulse" by Mihran et al. published by the Ultrasound Med Biol 1990, 16(3), pp. 297-309 and "Transient Modification of Nerve Excitability In Vitro by Single Ultrasound Pulses" by Mihran et al. found in the Department of Electrical and Computer Engineering, University of Colorado, 1990, paper #90-038, which are hereby incorporated by reference in their entirety.

Changes in the neural firing timing induce various sensory experiences depending on the location of the firing timing change in the cortex. The mapping of sensory areas of the cortex is known and used in current surgically invasive techniques.

...In a block 303, the signal generator 102 converts the firing time differences to a first signal 104A. For example, the first signal 104A may comprise an acoustical pattern, which comprises a plurality of amplitude and phase differences. In one embodiment, this conversion is accomplished by using known techniques in generating projective holograms. Acoustic holography is discussed in "Nearfield acoustic holography: I. Theory of generalized holography and the development of NAH" by J. D. Maynard et al. in the October 1985 issue of the Journal of the Acoustical Society of America, which is hereby incorporated by reference in its entirety.

...One advantage of the present system is that no surgery is needed to change neural activity causing a sensory experience.

Although the present invention has been described with reference to specific embodiments, these embodiments are illustrative only and not limiting. Many other applications of this present invention will be apparent in light of this disclosure and the following claims.

9. Government goals of developing electromagnetic brain cognition and non-invasive brain to brain communication devices.

The proposed research below describes cognition via electromagnetic signals which is a much more advanced technology than the transcranial magnetic stimulation therapies, TMS, currently available for depression and other ailments. TMS or magnetic stimulation therapies don't have the capability for precise targeting of specific brain cells. TMS technologies are often cited as being incapable of development into sophisticated mind control. But precise targeting via magnetic signals is a proven and classified technology as reported in the 1990 International Review of the Red Cross article which described weapons with specially adapted antenna systems and using the principle of magnetic concentration for precise targeting on the battlefield.

The Department of Commerce, June, 2002, four-hundred page report entitled, '*Converging Technologies For Improving Human Performance*' (<http://www.wtec.org/ConvergingTechnologies/>)

Page 355-6; 'Non-drug Treatments for Enhancement of Human Performance' by Robert Asher, Sandia Laboratories. ...Cogno. Understand how electromagnetics can be used to enhance cognitive performance as well as physiological performance. ...biotechnology in the understanding of cellular interaction with the electromagnetic fields. ...information technology in that the pulses need to be so shaped as to cause desired interconnected cell electromagnetic responses of cognition by external fields.

This article echoes the government's unwavering stance on mind control technologies for decades, i.e. full of promise but always a future capability. The articles never mention the classified mind control research dating back to the 1950s. May 1, 2003, Technology Review, "*Mind -machine merger: a \$24 million government initiative is jump-starting researchers' efforts to link brains and computers*" by Gregory T. Huang;

Even more remarkable, such devices could enhance decision-making, upgrade memory and cognitive skills, and even allow one person's brain to communicate wirelessly with another's. Although such applications are as speculative as they are spectacular, scientists no longer view them as pure fantasy.

...[DARPA's Defense Advanced Research Projects Agency, Allen Rudolph, program manager of the initiative] said, "we really don't envision implanting healthy people with these kinds of devices. The key to being able to restore or augment human capabilities, he says, will be gaining access to the brain signals in an unobtrusive way, ideally, without wires, electrodes, or surgeries." ...And though this vision is still years away, our minds may already be on the road to a new way of thinking."

[Contents](#) | [Top](#)

10. Nonlethal and information weapons programs in 2005; reports of excessive secrecy and little accountability.

Ethical abuses are being reported with recommendations of further study, discussion and regulation.

The 2005 articles below describe the secrecy issues surrounding nonlethal electromagnetic and mind control weapons. Mind control and electromagnetic weapons have been categorized by military experts under information warfare. See <http://mindjustice.org/russ9-05.htm>. As reported below, the weapons are advanced and overclassified with little accountability. There is ample evidence for concern and further investigation.

Washington Post Sept. 21, 2005 '*Commandos in the Streets?*' by William Arkin. The article described "...the use of experimental non-lethal weapons, and federal and military control of incident locations that are highly controversial and might border on the illegal."

Further, Granite Shadow posits domestic military operations, including intelligence collection and surveillance, unique rules of engagement regarding the use of lethal force, the use of experimental non-lethal weapons, and federal and military control of incident locations that are highly controversial and might border on the illegal.

...Both plans seem to live behind a veil of extraordinary secrecy because military forces operating under them have already been given a series of "special authorities" by the President and the secretary of defense. These special authorities include, presumably, military roles in civilian law enforcement and abrogation of State's powers in a declared or perceived emergency.

...

September 29, 2005, New York Times, "*Republicans See Signs That Pentagon Is Evading Oversight*" by Douglas Jehl;

Republican members of Congress say there are signs that the Defense Department may be carrying out new intelligence activities through programs intended to escape oversight from Congress and the new director of national intelligence.

The warnings are an unusually public signal of some Republican lawmakers' concern about overreaching by the Pentagon, where top officials have been jockeying with the new intelligence chief, John D. Negroponte, for primacy in intelligence operations. The lawmakers said they believed that some intelligence activities, involving possible propaganda efforts and highly technological initiatives, might be masked as so-called special access programs, the details of

which are highly classified.

"We see indications that the D.O.D. is trying to create parallel functions to what is going on in intelligence, but is calling it something else," Representative Peter Hoekstra, Republican of Michigan and chairman of the House Intelligence Committee, said in an interview.

Mr. Hoekstra said he believed that the purpose might be to obscure the extent of Pentagon intelligence activities and to keep them outside Mr. Negroponte's designated orbit. ...

The report said the committee believed that "individual services may have intelligence or intelligence-related programs such as science and technology projects or information operations programs related to defense intelligence that are embedded in other service budget line items, precluding sufficient visibility for program oversight."

"Information operations" is a military term used to describe activities including electronic warfare, psychological operations and counterpropaganda initiatives. ...

A spokesman for Mr. Negroponte, Carl Kropf, described coordination between Mr. Negroponte's office and the Pentagon as "excellent" on budget issues.

"Successfully integrating D.O.D.-unique intelligence programs and missions into the National Intelligence Program requires full transparency," Mr. Kropf said. "Such transparency exists today."

Finally, the October 6, 2005, Washington Post, *National and Homeland Security Microwaves, Lasers, Retired Generals For Sale* by William Arkin;

...Those concerns are being brushed aside as the weapons advance along the familiar development path of boosters and patrons feeding information to war gamers who feed study participants who feed researchers who feed manufactures. At the end of the day, it is hard to tell whether high powered microwaves and laser came into being because someone conceived it out of need or because its existence in the laboratory created the need.

This week, for example, one of my favorite directed energy patrons -- retired General Ron Fogleman -- received appointments at two corporations, as a "senior advisor" to the Galen Capital Group, LLC; and as a member of the board of advisors of Novastar Resources.

The former chief of staff of the Air Force is a military-industrial legend, head of his own consulting company Durango Aerospace Inc. with a client list that includes Boeing, FMC, Northrop Grumman, Raytheon, and RSL Electronics.

A quick check on the web shows that Fogleman also serves on the boards of no few than 14 corporations: AAR Corp, Alliant Techsystems, IDC, Mesa Air Group, MITRE Corporation, Rolls-Royce North America, Thales-Raytheon Systems, First National Bank of Durango, International Airline Service Group, ICN Pharmaceuticals, DERCO Aerospace, EAST Inc., World Airway, and North American Airlines. He is also Senior Vice President of something called Projects International, a DC consultancy and is or was a partner in Laird and Company, LLC. And he is a member of Donald Rumsfeld's Defense Policy Board Advisory Committee, on the NASA Advisory Council, the Jet Propulsion Laboratory Advisory Board, chairs the Falcon Foundation and the Airlift/Tanker Association. This guy is busy!

Fogleman gave up the job as the most powerful man in the Air Force on principle when he could no longer serve Secretary of Defense William Cohen. Since leaving, however, he has dispensed so much wisdom one wonders how much principle could be left.

One of Fogleman's first jobs upon leaving the Air Force was to chair the 1998 Directed Energy Applications for Tactical Airborne Combat study (known as "DE ATAC") which identified 65 concepts, particularly microwave weapons, selecting 20 for further analysis. The laboratory then awarded short-term concept development contracts for the five most promising to Boeing, Lockheed Martin, Coherent Technologies, and Sanders.

All during the 1990's, money flowed into continued development of directed energy weapons, but frankly not much happened. Everyone talked about an E-bomb being used in Iraq in 2003, but once again for a variety of technical and ethical reasons, and because the real world

intervened, the silver bullets remained on laboratory benches or in the world of "black" super-secret contracts, waiting for an opportunity. ...

11. Remote surveillance and NLWs (Nonlethal weapons); ethical concerns need to be studied and debated by experts and the public, ethicists conclude.

Concerns and ethics surrounding the ongoing development of electromagnetic mind control and surveillance technologies have been reported. Scientists having no qualms about the ethics of mind control are working on it. Ethical concerns regarding remote surveillance and NLWs need to be studied and openly discussed and regulations need to be implemented.

Opinion of the European Group on Ethics in Science and New Technologies to the European Commission No. 20 Adopted on 16/03/2005 posted at http://europa.eu.int/comm/european_group_ethics/docs/avis20en.pdf

On page 11; Surveillance or tracking devices.

Wearable ICT devices for tracking the human body: such a device allows an individual with a receiver to pinpoint someone's position worldwide.

Subdermal GPS Personal Location Devices: in May 2003, Applied Digital Solutions (ADS) claimed that "Digital Angel", a prototype implantable GPS tracking device had been successfully tested. However, technical experts are questioning whether the system could really work.

The disc-shaped "personal location device" measures 6.35 centimetres in diameter and 1.27 centimetres in depth - roughly the same size as a pace-maker. This GPS monitoring could be used for several purposes, such as for example, in case of medical emergencies (heart attack, epilepsy or diabetes), or for identification and location purposes (for people in high risk occupations, children, stalkers or suspected terrorists).

On page 35; Public Debate and Information

A broad social and political debate is needed as to what kind of applications should be accepted and legally approved, particularly concerning surveillance and enhancement. A precautionary approach is recommended by the EGE. The Member States and their national ethics councils (or corresponding institutions) have a responsibility to create conditions for education and constructive, well-informed debates in this area.

More information on the Digital Angel Corporation; Digital Angel Corporation develops and deploys sensor and communications technologies that enable rapid and accurate identification, location tracking, and condition monitoring of high-value assets. Applications for the Company's products include identification and monitoring of pets, fish, livestock, and humans through its patented implantable microchips; location tracking and message monitoring of vehicles and aircraft in remote locations through systems that integrate GPS and geosynchronous satellite communications; and monitoring of asset conditions such as temperature and movement, through advanced miniature sensors. Digital Angel Corporation is a majority-owned subsidiary of Applied Digital. For more information about Digital Angel, visit the company's website at www.destronfearing.com/rfid.htm

The Bradford Non-Lethal Weapons Research Project- Research Report No. 7 (May, 2005) is posted here: www.bradford.ac.uk/acad/nlw/

On page 13; Medical Ethics; In the December 2004 issue of the American Journal of Bioethics Jonathan Moreno, Professor of Biomedical Ethics at the University of Virginia, draws attention to 'Medical Ethics and Non-lethal Weapons.' His article reiterates the ethical issues surrounding the involvement of medical professionals in non-lethal weapons development, as previously discussed by Robin Coupland of the International Committee of the Red Cross. Moreno makes the following recommendation: From NLWs to the treatment of terrorists, it is time for a respected, independent entity such as the Institute of Medicine (IOM) to commission a study of these emerging challenges to medical ethics in the context of terrorism and national security.

The New Scientist published an editorial in March 2005 detailing research in the US to develop a Pulsed Energy Projectile (PEP) directed energy weapon(see the Directed Energy section of this

report), which raised serious ethical concerns over the research:

There is something chilling about turning research intended to ease suffering into a weapon that can be used to hurt people. Nociceptors, nerve cells that convey pain in the body, have been studied by researchers trying to relieve chronic pain. It emerged this week that a group working for the Pentagon is using that knowledge to turn the tables: to maximize the pain caused by a non-lethal weapon called PEP. So it is no surprise that pain researchers have reacted in horror to the plan.

This research was presented at the November 2004 Non-Lethal Technology and Academic Research (NTAR) Symposium at the University of New Hampshire, a forum where researchers, who are funded by the Joint-Non Lethal Weapons Directorate (JNLWD) through the Non-lethal Technology Innovation Center (NTIC), present their results.

Another example from the NTAR conference of medical research being channeled into weapons development is based on a new technology developed by the Center for Bioelectrics, which is a joint venture between the College of Engineering and Technology at Old Dominion University, Virginia and Eastern Virginia Medical School. The Air Force Research Laboratory (AFRL) funds the Center. Potential benefits of the new technology are described on the Center for Bioelectrics' web site;

Bioelectrics refers to the use of pulsed power, or the application of powerful electrical pulses, for extremely short periods of time, to manipulate biological cells, tissues and/or organisms. Researchers at the Center for Bioelectrics are testing the use of these high-intensity electrical surges to remove diseased or unwanted cells or groups of cells, such as tumors. Use of this technology in medicine and biology is the first of its kind in the world. The biomedical applications, based on ultrafast pulse-cell interactions, have extraordinary potential to treat persons with cancer, cardiovascular disease and other conditions.

However the US Air Force's interest in the technology is less altruistic. Part of the research effort, which was jointly presented at NTAR 2004 by the Center for Bioelectrics and the AFRL, addresses "Neuromuscular Disruption with Ultrashort Pulses." The purpose of research is to find a way of using the technique to cause electrical incapacitation in humans for use as a non-lethal weapon.

[Contents](#) | [Top](#)

12. How real and/or imminent is the possibility of sophisticated and surreptitious remote mind control? A summary.

Independent sources provide relevant information for the debate.

So far mainstream press does not report on the ongoing classified government neuroscience for weapons research. This incomplete and inaccurate reporting contributes to public misinformation.

Zhijun Wei verified the science and technology of the Russian electromagnetic antipersonnel weapons described in the 1988 German think tank article. Wei concluded that the descriptions of battlefield tracking and targeting of soldiers were scientifically accurate and possible.

Zhijun Wei's report concluded, "the science is feasible but very challenging for remote surveillance and tracking of humans via satellite." Wei's conclusions are reasonable given the evidence of classified remote surveillance programs and national security interests.

While Wei was able to conclude that with battlefield distances, remote tracking and targeting of humans is possible today, a classified new discovery or technology is necessary to achieve remote tracking and targeting of humans via satellite. Given the very real consequences of classified research, the possibility of classified surveillance technologies becomes more likely.

Addressing scientific criticisms against the possibility of mind control and remote human surveillance.

The 2005 Scientific American, the 1988 think tank article, the 2005 Washington Post article and Zhijun Wei all

cited the same technological roadblocks to sophisticated mind control and surveillance.

1. The need for a huge power source. But the 1988 think tank article described technology for battlefield distances which are available today. In addition, the military predicts development by 2009, according to the Dayton Daily News articles. Finally, the ICRC article described weapons technology using much lower energy levels to produce incapacitating and lethal effects.
2. Precise targeting of specific areas of brain is not possible with remote technology because electromagnetic pulses decline in power and precision with distance. But the 1988 article described alternative power sources, phased array radar and holography principles which overcome this problem at battlefield distances. The 1990 International Review of the Red Cross article also cited available technology using the principle of magnetic field concentration and specially adapted antenna systems.
3. Sophisticated mind control is not possible because as Delgado stated in the 2005 Scientific American article, "how complex information is encoded in the brain [is] a goal that neuroscientists are far from achieving." But Delgado described uncertainty with his 1950s-1970s mind control research; therapeutic benefits of human implants were unreliable, results varied from patient to patient and could be unpredictable even in the same patient. Delgado's nontherapeutic research on animals and humans was successful and "could control subjects' minds and bodies with the push of a button, according to the 2005 Scientific American article.

The precision problem and complex encoding of information by the brain was overcome to some degree in the 2003 Sony patent describing technology that is entirely non-invasive, unlike implants. The Sony patent describes technology for communication of complex information to the brain via an external source. Sensory data that could be finely tuned, focused and transmitted onto small groups of brain cells with ultrasound, creating sensory experiences such as sight, sound, taste, smell, touch. While the patent is not developed yet, the science is feasible according to scientists interviewed in the article.

The 1990 International Review of the Red Cross article, the 1976 Los Angeles Times article and several other sources above described developed and classified mind control technologies. Strangely, brain reading has not advanced since the 1976 Los Angeles Times article reported that an EEG or brainwave signals can determine whether someone is fatigued, puzzled or daydreaming, how someone perceives colors and shapes and tell the difference between a 'right' answer based on knowledge and one that was merely a lucky guess. Brainwave and related technologies are far from being developed into sophisticated thought reading which may be explained by the fact that thought reading is known to be classified since the mid 1970s.

And after many decades, the same rudimentary mind control technology that targets the human nervous system is repeatedly 'in development'. The unclassified weapons stun, disorient or immobilize. With a closer examination, a pattern of government control of the development and funding of electromagnetic mind control research emerged. In spite of the decades of research and interest, only the most basic 'mind control' technologies are ever discussed in the unclassified literature. After many decades, electromagnetic weapons are known to be extremely classified but how sophisticated or well developed is impossible to determine. What is known is that after decades of research, the science of electromagnetic mind control continues to remain well funded and scientifically feasible.

Sophisticated electromagnetic mind control weapons of extreme importance to national security are a likely explanation for this decades old pattern of classified electromagnetic weapons and the concurrent development and lack of progress with unclassified electromagnetic mind control technologies.

Articles and books describe mind control and remote human surveillance as heavily classified national security priorities.

Mind control and remote human surveillance are classified among the deepest secrets of the nation. Dr. McCulloch described 1950s classified mind control government research to find "where fancy is bred", i.e. the biological basis of consciousness.

The capability of technologies to detect and target the brain would seem to be, by analogy the same technology for detecting weak signals of moving targets and targeting weak signals towards a moving target. Tracking and targeting human brain signals may seem like science fiction, but when the problem is reduced to categories such as extremely weak signal detection and signal to noise issues, the science becomes feasible, although almost impossible to imagine from this vantage point. And as described in this report, government agencies were willing to go to extreme technological lengths for national security purposes.

Expert Jeffrey Richelson described classified satellite surveillance technologies. Two daunting technological problems were overcome. Richelson described scientist William Perry's work ; " it was feared that the noise from other, and unwanted, transmissions such as television signals would drown the telemetry in an ocean of noise. ...Before proceeding further, Wheelon asked William Perry, who had just left Sylvania's Electronic Defense Laboratories to form his own company, to study the matter. Six months later, he reported that the idea was workable." Richelson then described Project Moonbounce, in which "A typical signal received via moonbounce was a billion times weaker than if it were intercepted by an airplane ten miles from the transmitter. As a result, only very large antennae could effectively hear such signals and distinguish them from other signals" Dr. Cloud reported that remote sensing technologies were intended to be classified forever and were developed with unaccountable CIA funding and dating back to the 1940s.

Two 2005 Washington Post articles and a 2005 New York Times article cited excessive secrecy and evasion of congressional oversight surrounding very sophisticated psyops, information and nonlethal weapons which are related to mind control.

The capability for remote sensing of target individuals and groups was publicly cited as a government need, it looks like for the first time in 2003. National Defense, *'Special operators seeking a technological advantage, U.S. Special Operations*. The 1976 Los Angeles Times article and the 1990 International Review of the Red Cross article both described classified human surveillance capabilities; thought reading capabilities from a distance of several feet and electromagnetic weapons targeting capabilities at battlefield distances.

In light of this report, it becomes likely that scientifically feasible and powerful remote mind control weapons have been classified for decades. The general consensus is that sophisticated remote mind control is a future capability. Surprisingly and with a closer look, a valid and worthwhile counterargument can be made that sophisticated mind control and remote human surveillance are classified military and intelligence capabilities and are likely to remain classified.

Mind Justice's position

Some people believe that future weapons should remain classified. Some people believe that mind control technology should remain classified but that public input is a part of the democratic process. Mind Justice has collected reports of allegations from all over the world of abuses and torture using mind control technologies. Clearly the evidence in this report supports the news accounts of the lack of accountability and oversight of new mind control and electromagnetic technologies, even without the allegations.

Given the pattern of government development of mind control technologies for the past several decades, it is unlikely that sophisticated mind control will ever be an unclassified technology. Remote mind control technology requires huge research dollars and the potential of developing remote mind control technologies into weapons requires government regulation and control. Victims who claim they are targeted with mind control technologies are told that mind control is still science fiction and the claims are not investigated further. As illustrated in this report, mind control technologies today have remained rudimentary and little progress has been made even after decades of government funding, classified research and continued government funding and interest. This is an indication that mind control research is a national security priority and is very controlled by the government. The logical explanation is that unclassified mind control research is still science fiction but that the classified government research is well developed and advanced. Given this evidence, the many claims world wide should be taken seriously and investigated further. Mind Justice's position is that some public input is called for, along with accountability, oversight and mechanisms and processes for whistleblower reporting and protections.

Most people are unaware that mind control and surveillance technologies have been national security priorities and in development in most industrialized countries for decades. The hard to find facts and resultant conclusions in this report have rarely been reported in mainstream press, in part as a result of the government's interest in keeping mind control weapons classified. As seen in this report , a circumstantial case and serious argument in support of the existence of sophisticated, classified government mind control weapons and surveillance technologies can be made.

Mind Justice's position is that this issue should be extensively explored and publicized, mainly because of the growing numbers of complaints worldwide of government mind control abuses. The allegations of government mind control abuse are serious and shock the conscious of the reasonable person. Mind Justice hopes to hire professionals and experts in the future and gather information so that thorough investigations will take place.

[Contents](#) | [Top](#)

13. Experts warn of a lack of study and legislation for surveillance technologies and nonlethal weapons; a call for public and professional discussions, legislation and regulation. What can be done now.

The 2005 European Commission ethics report on surveillance and tracking devices recommended social and political debate. The 2005 University of Bradford nonlethal weapons research report cited ethicist Dr. Moreno and his recommendation for independent studies on the medical ethics of nonlethal weapons and the treatment of terrorists within the context of national security. Research by scientists to develop weapons to maximize pain were cited as serious ethical concerns. Three 2005 newspaper articles cited the lack of government regulation and oversight of new, very controversial and classified weapons, the Washington Posts article by William Arkin and New York Times article on the lack of oversight of very classified nonlethal weapons.

In the Washington Post article, William Arkin cited a lack of a sound deliberative process and careful weighing of consequences of the use of new weapons.

Now the public needs impartial and thorough reports and unbiased, reliable facts and information.

One possibility is a GAO or Government Accounting Office report on the new technologies and weapons. Any citizen can request a report from their congressman on topics such as;

1. Classified neuroscience research, the history, regulation, government oversight mechanisms and future implications.
2. Nonlethal, information and electromagnetic weapons, the history, regulation, government oversight mechanisms and future implications.
3. Remote human surveillance , the history, regulation and government oversight mechanisms and future implications.

Given the reported abuses and calls for regulation, public education of new emerging technologies and weapons should be a top priority.

Wired Blog Network senior editor Kevin Pousen [comments](#) on Washington Post article and offers this excellent advice: ". . . If Weinberger really think that somebody she interviewed is receiving microwave messages in their head from government spooks, she should nail that story down tight and collect her Pulitzer. (Why not bring a radio spectrum analyzer to their homes?)

Instead, it looks a lot like she exploited her sources' delusions to add color to an entirely unrelated story on government mind control research. For shame."

Commentary

by Cheryl Welsh
February 2007

The January 14, 2007 Washington Post Magazine article, Mind Games by Sharon Weinberger is stunning in it's coverage. The article is announced on the top front page of the Washington Post with the heading; "IS IT PARANOIA? OR THE PENTAGON? To most, the people who think the government is beaming voices into their heads are paranoid loonies in foil helmets. Trouble is, the govenment has pursued weapons tht could do just that."

The full cover page of the Washington Post Magazine displays the picture and heading "THOUGHT WARS One thing is certain about the emerging subculture of self-described mind-control victims: Their agony is real" and the full article encompasses amost 7,500 words. The full article is posted below and is well worth reading. Weinberger seriously investigated the very controversial issue of alleged government mind control victims, a topic that mainstream media has avoided or has dismissed as conspiracy nut cases without further examination.

The article has opened the door to much needed debate and serious, impartial reporting and investigation. Not many human rights issues make it to the front pages of a national newspaper. The article represents a major step forward in mind control activism. A sincere thank you to Sharon Weinberger for your long hours of research and to the Washington Post for this very special opportunity!

The article is an entertaining and realistic read, while at the same time, an accurate description of the psychological devastation and pain-filled lives of mind control victims. There were indepth interviews of Harlan Girard, director of International Committee on Offensive Microwave Weapons (website at www.icomw.org) and Gloria Naylor, author of 1996, a book on her experience of mind control. Naylor bravely and openly discussed taking antipsychotic medication for the voices she heard but the medicine did not stop the voices. The mental health field has helped many people who report hearing voices but most mind control victims report experiences like Naylor, and have not found relief from the voices by using medication. Although most mental health experts do not believe the government is behind technology to cause the phenoma of hearing voices, most victims and their support groups leave it up to victims to decide what to do in regards to trying antipsychotic medication or seeking out mental health experts. Many desperately try medication to obtain relief.

Ed Moore, a young medical doctor described his inspiring efforts to study for an electrical engineering degree inspite of voices that taunt him 24/7. There were several shorter comments by many other victims and also military and psychiatric experts. Weinberger described intelligent, talented, educated victims of mind control and that most are not mentally ill, as so often portrayed in the media. The experts in the article described victims as having "highly emotional and gripping experiences" and as a result, victims provide a "compelling narative" to explain their perceptions of the experiences.

As an alternative explanation and the one that most mind control victims firmly believe, Weinberger also provided several sections on government research into mind control technologies such as beaming voices into peoples heads. Here are some relevant excerpts from

the article, followed by short comments or questions IN CAPITAL LETTERS, for future debate and investigation.

The biggest hurdle for TIs is getting people to take their concerns seriously. A proposal made in 2001 by Rep. Dennis Kucinich (D-Ohio) to ban "psychotronic weapons" (another common term for mind-control technology) was hailed by TIs as a great step forward. But the bill was widely derided by bloggers and columnists and quickly dropped.

Doug Gordon, Kucinich's spokesman, would not discuss mind control other than to say the proposal was part of broader legislation outlawing weapons in space. The bill was later reintroduced, minus the mind control. "It was not the concentration of the legislation, which is why it was tightened up and redrafted," was all Gordon would say.

WHY WAS WEINBERGER UNABLE TO OBTAIN BACKGROUND INFORMATION ON A PROPOSED BILL FOR BANNING MIND CONTROL WEAPONS?

Concerns about microwaves and mind control date to the 1960s, when the U.S. government discovered that its embassy in Moscow was being bombarded by low-level electromagnetic radiation. In 1965, according to declassified Defense Department documents, the Pentagon, at the behest of the White House, launched Project Pandora, top-secret research to explore the behavioral and biological effects of low-level microwaves. For approximately four years, the Pentagon conducted secret research: zapping monkeys; exposing unwitting sailors to microwave radiation; and conducting a host of other unusual experiments (a sub-project of Project Pandora was titled Project Bizarre). The results were mixed, and the program was plagued by disagreements and scientific squabbles. The "Moscow signal," as it was called, was eventually attributed to eavesdropping, not mind control, and Pandora ended in 1970. And with it, the military's research into so-called non-thermal microwave effects seemed to die out, at least in the unclassified realm.

But there are hints of ongoing research: An academic paper written for the Air Force in the mid-1990s mentions the idea of a weapon that would use sound waves to send words into a person's head. "The signal can be a 'message from God' that can warn the enemy of impending doom, or encourage the enemy to surrender," the author concluded.

In 2002, the Air Force Research Laboratory patented precisely such a technology: using microwaves to send words into someone's head. That work is frequently cited on mind-control Web sites. Rich Garcia, a spokesman for the research laboratory's directed energy directorate, declined to discuss that patent or current or related research in the field, citing the lab's policy not to comment on its microwave work.

In response to a Freedom of Information Act request filed for this article, the Air Force released unclassified documents surrounding that 2002 patent -- records that note that the patent was based on human experimentation in October 1994 at the Air Force lab, where scientists were able to transmit phrases into the heads of human subjects, albeit with marginal intelligibility. Research appeared to continue at least through 2002. Where this work has gone since is unclear -- the research laboratory, citing classification, refused to discuss it or release other materials.

The official U.S. Air Force position is that there are no non-thermal effects of microwaves. Yet Dennis Bushnell, chief scientist at NASA's Langley Research Center, tagged microwave attacks against the human brain as part of future warfare in a 2001 presentation to the National Defense Industrial Association about "Future Strategic Issues."

"That work is exceedingly sensitive" and unlikely to be reported in any unclassified documents, he says.

Meanwhile, the military's use of weapons that employ electromagnetic radiation to create pain is well-known, as are some of the limitations of such weapons. In 2001, the Pentagon declassified one element of this research: the Active Denial System, a weapon that uses electromagnetic radiation to heat skin and create an intense burning sensation. So, yes, there is technology designed to beam painful invisible rays at humans, but the weapon seems to fall far short of what could account for many of the TIs' symptoms. While its exact range is classified, Doug Beason, an expert in directed-energy weapons, puts it at about 700 meters, and the beam cannot penetrate a number of materials, such as aluminum. Considering the size of the full-scale weapon, which resembles a satellite dish, and its operational limitations, the ability of the government or anyone else to shoot beams at hundreds of people -- on city streets, into their homes and while they travel in cars and planes -- is beyond improbable.

But, given the history of America's clandestine research, it's reasonable to assume that if the defense establishment could develop mind-control or long-distance ray weapons, it almost certainly would. And, once developed, the possibility that they might be tested on innocent civilians could not be categorically dismissed.

BASED ON THIS PRELIMINARY REPORTING BY WEINBERGER, MUCH MORE RESEARCH AND INVESTIGATION INTO CLASSIFIED MIND CONTROL RESEARCH AND GOVERNMENT ACCOUNTABILITY IS CALLED FOR.

A former Green Beret who served in Vietnam, Alexander went on to a number of national security jobs, and rubbed shoulders with prominent military and political leaders. . . . Alexander also is intrigued by the possibility of using electronic means to modify behavior. The dilemma of the war on terrorism, he notes, is that it never ends. So what do you do with enemies, such as those at Guantanamo: keep them there forever? That's impractical. Behavior modification could be an alternative, he says.

"Maybe I can fix you, or electronically neuter you, so it's safe to release you into society, so you won't come back and kill me," Alexander says. It's only a matter of time before technology allows that scenario to come true, he continues. "We're now getting to where we can do that."

[Disclosure & Record of Invention](#) 560 K
[Letter From O'Loughlin to Judge Advocate](#) 600 K
[Draft of Patent Part 1](#) 2.6 M

[Draft of Patent Part 2](#) 2.8 M

[Draft of Patent Part 3](#) 2.3 M

One document is a 1994 initial patent by O'Loughlin for "A method for encoding and transmitting speech by means of the radio frequency hearing phenomena." The document stated: The uses of the invention by the government are described as: a) "A useful psychological warfare communications tool". . . c) A "no wires or receiving apparatus" communications method required for high acoustic noise environments such as: aircraft, space missions, and hostage situations. . . .

The final patent is O'Loughlin JP, Loree DL: Method and device for implementing the radio frequency hearing effect. US patent #6470214, Oct 22, 2002

Allen Barker, PhD and founder of mcactivism list group (<http://groups.yahoo.com/group/mcactivism/>). Allen made the following relevant email comments on January 26th 2007.

One document [from Sharon Weinberger's FOIA request] is an Aug. 2001 letter from O'Loughlin to the Judge Advocate handling the patent case, and the other is a draft of the patent from 1994 which contains some different information than the final patent.

In the Washington Post article "Mind Games," Sharon Weinberger writes that she obtained "records that note that the patent was based on human experimentation in October 1994 at the Air Force lab, where scientists were able to transmit phrases into the heads of human subjects, albeit with marginal intelligibility." But these were initial experiments, using the simple AM modulation (which would be expected to give marginal intelligibility). Using the actual process in the patent "will produce an undistorted subjective sound; which is the invention," according to the draft of the patent. O'Loughlin's letter to the Judge Advocate states, "... the fact that when the signal is processed by the teachings of the invention the signal is intelligible has also been experimentally demonstrated."

As engineer, Eleanor White (website at www.raven1.net) has documented for years, voice to skull has been around for more than now three decades and is simple in operation. Eleanor writes, microwave voice to skull:

- Is NOT a classified technology.
- Was successfully demonstrated in 1973 by Dr. Joseph Sharp, then working with the Walter Reed Army Institute of Research.
- Was publicly announced at a seminar given to the combined faculties of engineering and psychology at the University of Utah, August 21, 1974.
- Was published, including the details of how the signal works, in the journal "American Psychologist" in the March, 1975 issue, in the article titled "Microwaves and Behavior" by Dr. Don Justesen.
- Is simple in concept: For every high to low transition of the speaker's voice wave form, one single microwave pulse is transmitted, which is heard inside the skull of the target as a re-creation of the original voice. This is a primitive form of digital audio.
- The conversion of voice to pulses, then re-creation of the voice from the pulses, can easily be demonstrated by playing a voice tape into the input side of a common 555 timer chip,

which converts the voice to a string of clicks. Connecting that string of clicks to a speaker will re-create the voice.

- An experienced radar technician can patch a voice-to-clicks speech converter into a radar set which is powerful enough to cause clicks to be heard. This radar set will then function as a through-wall voice to skull radar transmitter.
- Anyone with an upper middle class income has been able to acquire voice to skull technology since it was publicly announced in the mid-1970s. Those are all provable facts, not anyone's opinion.

Any radio technician can open up an ordinary radio receiver and connect a microphone into the circuit so your voice comes out of your radio. It is no more complex for a radar tech to patch a voice-to-clicks converter into radar circuitry.

These V2S scans can now be accessed via the excerpt I posted ten years ago at this link: <http://www.raven1.net/v2succes.htm>

You can also directly access the four pages at these links:

<http://www.raven1.net/v2success1.gif>

American Psychologist", March 1975 issue, in the article titled "Microwaves and Behavior" by Dr. Don Justesen. This is the first page of that issue of the journal itself, with "masthead", i.e. ID of that particular issue, with part of the table of contents.

<http://www.raven1.net/v2success2.gif>

This is the continuing table of contents, and there is a star marking the article containing the voice to skull details.

<http://www.raven1.net/v2success3.gif>

This is the beginning page of Dr. Don Justesen's article, and of particular interest is the fine print note at the bottom of the page.

<http://www.raven1.net/v2success4.gif>

This is the page on which technical details of Sharp's voice to skull conversion of voice to pulses is explained. The method is simple and the excerpt is short.

Barker made the following relevant comments on the American Psychologist article.

Justesen reported in "Microwaves and Behavior," American Psychologist, March 1975, that Sharp and Grove had successfully encoded speech (the spoken digits from one to ten) in a pulsed microwave signal. The method reported in that article is essentially an FM modulation, rather than an AM modulation. That paper states that "the electrical sine-wave analogs of each word were then processed so that each time a sine wave crossed zero reference in the negative direction, a brief pulse of microwave energy was triggered." That sounds like they are taking a Fourier decomposition of the speech signal and then using a frequency modulation on all of the Fourier components, simultaneously. The results reported in the O'Loughlin patent for AM modulation do not necessarily apply to the FM modulation methods.

For those who would like a more technical explanation of the O'Loughlin patent, Allen Barker further wrote:

The scientific principle underlying the invention, and assumed by the inventors, is that thermal expansion can convert microwave pulses to acoustic signals. As everyone knows from basic science, when things heat up they tend to expand, and when they cool down they tend to contract. Microwave pulses carry energy, and when a pulse is absorbed by biological tissue this energy is converted to heat. This causes the tissue to expand very slightly, and then to contract back when it cools. This is basically the standard model for describing and analyzing the microwave hearing effect (and has been for several decades). A single microwave pulse causes a click to be heard. More complex signals can be broken down into strings of "clicks" by various modulation methods. The amplitude of the induced acoustic wave is (at least roughly) proportional to the power level of the microwave pulse.

The basic modulation method used in the O'Loughlin patent is an amplitude modulation. In a simple amplitude modulation, the signal is broken up into discrete samples in time and then the power level of the microwave pulse train is modulated accordingly. This is "an AM modulated envelope over a pulsed RF carrier train." This method unfortunately introduces nonlinear distortion which cannot be compensated for by preprocessing. It works for tones, but not for complex signals such as speech. This is theoretically worked out in the draft patent, which also describes experimental verification that the simple AM modulation produces barely intelligible speech. The experiments were conducted at "the Air Force Phillips Laboratory during the week of 24 Oct 94, using the AM sampled data modulation process." Subjects could recognize the encoded messages, but only if they were told what the message was.

The patent actually makes use of a different form of AM modulation, the "AM double sideband suppressed carrier" method, which is linear in the amplitude and allows for preprocessing of the audio signal. They state (and show) that "conventional AM modulation ... is not useful for the implementation of this invention."

O'Loughlin points out in his letter that since the power of a microwave signal is proportional to the square of its amplitude, and since the acoustic signal at the head is roughly proportional to the microwave signal's power level, the microwave signal's amplitude should be modulated according to the square root of the original audio signal's amplitude. According to O'Loughlin, "This is the basic essence of the invention." It is essentially a preprocessing of the input audio signal. Other preprocessing is also applied, for example to decrease the higher frequencies according to a spherical model of a human head (which shows "a 40dB per decade slope in favor of the higher frequencies").

... In a calculation in the draft patent, the sound level is calculated for a single tone sent via the AM balanced modulator method. A 1GHz RF carrier is used, with a power level of 100mW/sqcm. The calculation yields a sound level of ~50dB, which is said to be at the level of "a normal male voice at one meter." The calculations do not take several loss sources into account, though, and the actual sound level would be somewhat lower. It is calculated that the 100mW/sqcm signal could be applied for ten seconds and stay within the ANSI exposure level at 1GHz.

The suppressed-carrier method only outputs power while a signal is present, so power levels would be much less of a problem unless someone were really being blasted by a constant auditory stream.

New on the Internet: a community of people who believe the government is beaming voices into their minds. They may be crazy, but the Pentagon has pursued a weapon that can do just that.

By Sharon Weinberger
Sunday, January 14, 2007; W22

Washington Post Magazine

IF HARLAN GIRARD IS CRAZY, HE DOESN'T ACT THE PART. He is standing just where he said he would be, below the Philadelphia train station's World War II memorial -- a soaring statue of a winged angel embracing a fallen combatant, as if lifting him to heaven. Girard is wearing pressed khaki pants, expensive-looking leather loafers and a crisp blue button-down. He looks like a local businessman dressed for a casual Friday -- a local businessman with a wickedly dark sense of humor, which had become apparent when he said to look for him beneath "the angel sodomizing a dead soldier." At 70, he appears robust and healthy -- not the slightest bit disheveled or unusual-looking. He is also carrying a bag.

Girard's description of himself is matter-of-fact, until he explains what's in the bag: documents he believes prove that the government is attempting to control his mind. He carries that black, weathered bag everywhere he goes. "Every time I go out, I'm prepared to come home and find everything is stolen," he says.

The bag aside, Girard appears intelligent and coherent. At a table in front of Dunkin' Donuts inside the train station, Girard opens the bag and pulls out a thick stack of documents, carefully labeled and sorted with yellow sticky notes bearing neat block print. The documents are an authentic-looking mix of news stories, articles culled from military journals and even some declassified national security documents that do seem to show that the U.S. government has attempted to develop weapons that send voices into people's heads.

"It's undeniable that the technology exists," Girard says, "but if you go to the police and say, 'I'm hearing voices,' they're going to lock you up for psychiatric evaluation."

The thing that's missing from his bag -- the lack of which makes it hard to prove he isn't crazy -- is even a single document that would buttress the implausible notion that the government is currently targeting a large group of American citizens with mind-control technology. The only direct evidence for that, Girard admits, lies with alleged victims such as himself.

And of those, there are many.

IT'S 9:01 P.M. WHEN THE FIRST PERSON SPEAKS during the Saturday conference call.

Unsure whether anyone else is on the line yet, the female caller throws out the first question: "You got gang stalking or V2K?" she asks no one in particular.

There's a short, uncomfortable pause.

"V2K, really bad. 24-7," a man replies.

"Gang stalking," another woman says.

"Oh, yeah, join the club," yet another man replies.

The members of this confessional "club" are not your usual victims. This isn't a group for

alcoholics, drug addicts or survivors of childhood abuse; the people connecting on the call are self-described victims of mind control -- people who believe they have been targeted by a secret government program that tracks them around the clock, using technology to probe and control their minds.

The callers frequently refer to themselves as TIs, which is short for Targeted Individuals, and talk about V2K -- the official military abbreviation stands for "voice to skull" and denotes weapons that beam voices or sounds into the head. In their esoteric lexicon, "gang stalking" refers to the belief that they are being followed and harassed: by neighbors, strangers or colleagues who are agents for the government.

A few more "hellos" are exchanged, interrupted by beeps signaling late arrivals: Bill from Columbus, Barbara from Philadelphia, Jim from California and a dozen or so others. Derrick Robinson, the conference call moderator, calls order.

"It's five after 9," says Robinson, with the sweetly reasonable intonation of a late-night radio host. "Maybe we should go ahead and start."

THE IDEA OF A GROUP OF PEOPLE CONVINCED THEY ARE TARGETED BY WEAPONS that can invade their minds has become a cultural joke, shorthand by the image of solitary lunatics wearing tinfoil hats to deflect invisible mind beams. "Tinfoil hat," says Wikipedia, has become "a popular stereotype and term of derision; the phrase serves as a byword for paranoia and is associated with conspiracy theorists."

In 2005, a group of MIT students conducted a formal study using aluminum foil and radio signals. Their surprising finding: Tinfoil hats may actually amplify radio frequency signals. Of course, the tech students meant the study as a joke.

But during the Saturday conference call, the subject of aluminum foil is deadly serious. The MIT study had prompted renewed debate; while a few TIs realized it was a joke at their expense, some saw the findings as an explanation for why tinfoil didn't seem to stop the voices. Others vouched for the material.

"Tinfoil helps tremendously," reports one conference call participant, who describes wrapping it around her body underneath her clothing.

"Where do you put the tinfoil?" a man asks.

"Anywhere, everywhere," she replies. "I even put it in a hat."

A TI in an online mind-control forum recommends a Web site called "Block EMF" (as in electromagnetic frequencies), which advertises a full line of clothing, including aluminum-lined boxer shorts described as a "sheer, comfortable undergarment you can wear over your regular one to shield yourself from power lines and computer electric fields, and microwave, radar, and TV radiation." Similarly, a tinfoil hat disguised as a regular baseball cap is "smart and subtle."

For all the scorn, the ranks of victims -- or people who believe they are victims -- are speaking up. In the course of the evening, there are as many as 40 clicks from people joining the call, and much larger numbers participate in the online forum, which has 143 members. A note there mentioning interest from a journalist prompted more than 200 e-mail responses.

Until recently, people who believe the government is beaming voices into their heads would have added social isolation to their catalogue of woes. But now, many have discovered hundreds,

possibly thousands, of others just like them all over the world. Web sites dedicated to electronic harassment and gang stalking have popped up in India, China, Japan, South Korea, the United Kingdom, Russia and elsewhere. Victims have begun to host support meetings in major cities, including Washington. Favorite topics at the meetings include lessons on how to build shields (the proverbial tinfoil hats), media and PR training, and possible legal strategies for outlawing mind control.

The biggest hurdle for TIs is getting people to take their concerns seriously. A proposal made in 2001 by Rep. Dennis Kucinich (D-Ohio) to ban "psychotronic weapons" (another common term for mind-control technology) was hailed by TIs as a great step forward. But the bill was widely derided by bloggers and columnists and quickly dropped.

Doug Gordon, Kucinich's spokesman, would not discuss mind control other than to say the proposal was part of broader legislation outlawing weapons in space. The bill was later reintroduced, minus the mind control. "It was not the concentration of the legislation, which is why it was tightened up and redrafted," was all Gordon would say.

Unable to garner much support from their elected representatives, TIs have started their own PR campaign. And so, last spring, the Saturday conference calls centered on plans to hold a rally in Washington. A 2005 attempt at a rally drew a few dozen people and was ultimately rained out; the TIs were determined to make another go of it. Conversations focused around designing T-shirts, setting up congressional appointments, fundraising, creating a new Web site and formalizing a slogan. After some debate over whether to focus on gang stalking or mind control, the group came up with a compromise slogan that covered both: "Freedom From Covert Surveillance and Electronic Harassment."

Conference call moderator Robinson, who says his gang stalking began when he worked at the National Security Agency in the 1980s, offers his assessment of the group's prospects: Maybe this rally wouldn't produce much press, but it's a first step. "I see this as a movement," he says. "We're picking up people all the time."

HARLAN GIRARD SAYS HIS PROBLEMS BEGAN IN 1983, while he was a real estate developer in Los Angeles. The harassment was subtle at first: One day a woman pulled up in a car, wagged her finger at him, then sped away; he saw people running underneath his window at night; he noticed some of his neighbors seemed to be watching him; he heard someone moving in the crawl space under his apartment at night.

Girard sought advice from this then-girlfriend, a practicing psychologist, whom he declines to identify. He says she told him, "Nobody can become psychotic in their late 40s." She said he didn't seem to manifest other symptoms of psychotic behavior -- he dressed well, paid his bills -- and, besides his claims of surveillance, which sounded paranoid, he behaved normally. "People who are psychotic are socially isolated," he recalls her saying.

After a few months, Girard says, the harassment abruptly stopped. But the respite didn't last. In 1984, appropriately enough, things got seriously weird. He'd left his real estate career to return to school at the University of Pennsylvania, where he was studying for a master's degree in landscape architecture. He harbored dreams of designing parks and public spaces. Then, he says, he began to hear voices. Girard could distinguish several different male voices, which came complete with a mental image of how the voices were being generated: from a recording studio, with "four slops sitting around a card table drinking beer," he says.

The voices were crass but also strangely courteous, addressing him as "Mr. Girard."

They taunted him. They asked him if he thought he was normal; they suggested he was going crazy. They insulted his classmates: When an overweight student showed up for a field trip in a white raincoat, they said, "Hey, Mr. Girard, doesn't she look like a refrigerator?"

Six months after the voices began, they had another question for him: "Mr. Girard, Mr. Girard. Why aren't you dead yet?" At first, he recalls, the voices would speak just two or three times a day, but it escalated into a near-constant cacophony, often accompanied by severe pain all over his body -- which Girard now attributes to directed-energy weapons that can shoot invisible beams.

The voices even suggested how he could figure out what was happening to him. He says they told him to go to the electrical engineering department to "tell them you're writing science fiction and you don't want to write anything inconsistent with physical reality. Then tell them exactly what has happened."

Girard went and got some rudimentary explanations of how technology could explain some of the things he was describing.

"Finally, I said: 'Look, I must come to the point, because I need answers. This is happening to me; it's not science fiction.'" They laughed.

He got the same response from friends, he says. "They regarded me as crazy, which is a humiliating experience."

When asked why he didn't consult a doctor about the voices and the pain, he says, "I don't dare start talking to people because of the potential stigma of it all. I don't want to be treated differently. Here I was in Philadelphia. Something was going on, I don't know any doctors . . . I know somebody's doing something to me."

It was a struggle to graduate, he says, but he was determined, and he persevered. In 1988, the same year he finished his degree, his father died, leaving Girard an inheritance large enough that he did not have to work.

So, instead of becoming a landscape architect, Girard began a full-time investigation of what was happening to him, often traveling to Washington in pursuit of government documents relating to mind control. He put an ad in a magazine seeking other victims. Only a few people responded. But over the years, as he met more and more people like himself, he grew convinced that he was part of what he calls an "electronic concentration camp."

What he was finding on his research trips also buttressed his belief: Girard learned that in the 1950s, the CIA had drugged unwitting victims with LSD as part of a rogue mind-control experiment called MK-ULTRA. He came across references to the CIA seeking to influence the mind with electromagnetic fields. Then he found references in an academic research book to work that military researchers at Walter Reed Army Institute of Research had done in the 1970s with pulsed microwaves to transmit words that a subject would hear in his head. Elsewhere, he came across references to attempts to use electromagnetic energy, sound waves or microwave beams to cause non-lethal pain to the body. For every symptom he experienced, he believed he found references to a weapon that could cause it.

How much of the research Girard cites checks out?

Concerns about microwaves and mind control date to the 1960s, when the U.S. government discovered that its embassy in Moscow was being bombarded by low-level electromagnetic

radiation. In 1965, according to declassified Defense Department documents, the Pentagon, at the behest of the White House, launched Project Pandora, top-secret research to explore the behavioral and biological effects of low-level microwaves. For approximately four years, the Pentagon conducted secret research: zapping monkeys; exposing unwitting sailors to microwave radiation; and conducting a host of other unusual experiments (a sub-project of Project Pandora was titled Project Bizarre). The results were mixed, and the program was plagued by disagreements and scientific squabbles. The "Moscow signal," as it was called, was eventually attributed to eavesdropping, not mind control, and Pandora ended in 1970. And with it, the military's research into so-called non-thermal microwave effects seemed to die out, at least in the unclassified realm.

But there are hints of ongoing research: An academic paper written for the Air Force in the mid-1990s mentions the idea of a weapon that would use sound waves to send words into a person's head. "The signal can be a 'message from God' that can warn the enemy of impending doom, or encourage the enemy to surrender," the author concluded.

In 2002, the Air Force Research Laboratory patented precisely such a technology: using microwaves to send words into someone's head. That work is frequently cited on mind-control Web sites. Rich Garcia, a spokesman for the research laboratory's directed energy directorate, declined to discuss that patent or current or related research in the field, citing the lab's policy not to comment on its microwave work.

In response to a Freedom of Information Act request filed for this article, the Air Force released unclassified documents surrounding that 2002 patent -- records that note that the patent was based on human experimentation in October 1994 at the Air Force lab, where scientists were able to transmit phrases into the heads of human subjects, albeit with marginal intelligibility. Research appeared to continue at least through 2002. Where this work has gone since is unclear -- the research laboratory, citing classification, refused to discuss it or release other materials.

The official U.S. Air Force position is that there are no non-thermal effects of microwaves. Yet Dennis Bushnell, chief scientist at NASA's Langley Research Center, tagged microwave attacks against the human brain as part of future warfare in a 2001 presentation to the National Defense Industrial Association about "Future Strategic Issues."

"That work is exceedingly sensitive" and unlikely to be reported in any unclassified documents, he says.

Meanwhile, the military's use of weapons that employ electromagnetic radiation to create pain is well-known, as are some of the limitations of such weapons. In 2001, the Pentagon declassified one element of this research: the Active Denial System, a weapon that uses electromagnetic radiation to heat skin and create an intense burning sensation. So, yes, there is technology designed to beam painful invisible rays at humans, but the weapon seems to fall far short of what could account for many of the TIs' symptoms. While its exact range is classified, Doug Beason, an expert in directed-energy weapons, puts it at about 700 meters, and the beam cannot penetrate a number of materials, such as aluminum. Considering the size of the full-scale weapon, which resembles a satellite dish, and its operational limitations, the ability of the government or anyone else to shoot beams at hundreds of people -- on city streets, into their homes and while they travel in cars and planes -- is beyond improbable.

But, given the history of America's clandestine research, it's reasonable to assume that if the defense establishment could develop mind-control or long-distance ray weapons, it almost certainly would. And, once developed, the possibility that they might be tested on innocent

civilians could not be categorically dismissed.

Girard, for his part, believes these weapons were not only developed but were also tested on him more than 20 years ago.

What would the government gain by torturing him? Again, Girard found what he believed to be an explanation, or at least a precedent: During the Cold War, the government conducted radiation experiments on scores of unwitting victims, essentially using them as human guinea pigs. Girard came to believe that he, too, was a walking experiment.

Not that Girard thinks his selection was totally random: He believes he was targeted because of a disparaging remark he made to a Republican fundraiser about George H.W. Bush in the early 1980s. Later, Girard says, the voices confirmed his suspicion.

"One night I was going to bed; the usual drivel was going on," he says. "The constant stream of drivel. I was just about to go to bed, and a voice says: 'Mr. Girard, do you know who was in our studio with us? That was George Bush, vice president of the United States.'"

GIRARD'S STORY, HOWEVER STRANGE, reflects what TIs around the world report: a chance encounter with a government agency or official, followed by surveillance and gang stalking, and then, in many cases, voices, and pain similar to electric shocks. Some in the community have taken it upon themselves to document as many cases as possible. One TI from California conducted about 50 interviews, narrowing the symptoms down to several major areas: "ringing in the ears," "manipulation of body parts," "hearing voices," "piercing sensation on skin," "sinus problems" and "sexual attacks." In fact, the TI continued, "many report the sensation of having their genitalia manipulated."

Both male and female TIs report a variety of "attacks" to their sexual organs. "My testicles became so sore I could barely walk," Girard says of his early experiences. Others, however, report the attacks in the form of sexual stimulation, including one TI who claims he dropped out of the seminary after constant sexual stimulation by directed-energy weapons. Susan Sayler, a TI in San Diego, says many women among the TIs suffer from attacks to their sexual organs but are often embarrassed to talk about it with outsiders.

"It's sporadic, you just never know when it will happen," she says. "A lot of the women say it's as soon as you lay down in bed -- that's when you would get hit the worst. It happened to me as I was driving, at odd times."

What made her think it was an electronic attack and not just in her head? "There was no sexual attraction to a man when it would happen. That's what was wrong. It did not feel like a muscle spasm or whatever," she says. "It's so . . . electronic."

Gloria Naylor, a renowned African American writer, seems to defy many of the stereotypes of someone who believes in mind control. A winner of the National Book Award, Naylor is best known for her acclaimed novel, *The Women of Brewster Place*, which described a group of women living in a poor urban neighborhood and was later made into a miniseries by Oprah Winfrey.

But in 2005, she published a lesser-known work, *1996*, a semi-autobiographical book describing her experience as a TI. "I didn't want to tell this story. It's going to take courage. Perhaps more courage than I possess, but they've left me no alternatives," Naylor writes at the beginning of her book. "I am in a battle for my mind. If I stop now, they'll have won, and I will lose myself." The

book is coherent, if hard to believe. It's also marked by disturbing passages describing how Jewish American agents were responsible for Naylor's surveillance. "Of the many cars that kept coming and going down my road, most were driven by Jews," she writes in the book. When asked about that passage in a recent interview, she defended her logic: Being from New York, she claimed, she can recognize Jews.

Naylor lives on a quiet street in Brooklyn in a majestic brownstone with an interior featuring intricate woodwork and tasteful decorations that attest to a successful literary career. She speaks about her situation calmly, occasionally laughing at her own predicament and her struggle with what she originally thought was mental illness. "I would observe myself," she explains. "I would lie in bed while the conversations were going on, and I'd ask: Maybe it is schizophrenia?"

Like Girard, Naylor describes what she calls "street theater" -- incidents that might be dismissed by others as coincidental, but which Naylor believes were set up. She noticed suspicious cars driving by her isolated vacation home. On an airplane, fellow passengers mimicked her every movement -- like mimes on a street.

Voices similar to those in Girard's case followed -- taunting voices cursing her, telling her she was stupid, that she couldn't write. Expletive-laced language filled her head. Naylor sought help from a psychiatrist and received a prescription for an antipsychotic drug. But the medication failed to stop the voices, she says, which only added to her conviction that the harassment was real.

For almost four years, Naylor says, the voices prevented her from writing. In 2000, she says, around the time she discovered the mind-control forums, the voices stopped and the surveillance tapered off. It was then that she began writing 1996 as a "catharsis."

Colleagues urged Naylor not to publish the book, saying she would destroy her reputation. But she did publish, albeit with a small publishing house. The book was generally ignored by critics but embraced by TIs.

Naylor is not the first writer to describe such a personal descent. Evelyn Waugh, one of the great novelists of the 20th century, details similar experiences in *The Ordeal of Gilbert Pinfold*. Waugh's book, published in 1957, has eerie similarities to Naylor's. Embarking on a recuperative cruise, Pinfold begins to hear voices on the ship that he believes are part of a wireless system capable of broadcasting into his head; he believes the instigator recruited fellow passengers to act as operatives; and he describes "performances" put on by passengers directed at him yet meant to look innocuous to others.

Waugh wrote his book several years after recovering from a similar episode and realizing that the voices and paranoia were the result of drug-induced hallucinations.

Naylor, who hasn't written a book since 1996, is now back at work on an historical novel she hopes will return her to the literary mainstream. She remains convinced that she was targeted by mind control. The many echoes of her ordeal she sees on the mind-control forums reassure her she's not crazy, she says.

Of course, some of the things she sees on the forum do strike her as crazy. "But who I am to say?" she says. "Maybe I sound crazy to somebody else."

SOME TIS, SUCH AS ED MOORE, A YOUNG MEDICAL DOCTOR, take a slightly more skeptical approach. He criticizes what he calls the "wacky claims" of TIs who blame various

government agencies or groups of people without any proof. "I have yet to see a claim of who is behind this that has any data to support it," he writes.

Nonetheless, Moore still believes the voices in his head are the result of mind control and that the U.S. government is the most likely culprit. Moore started hearing voices in 2003, just as he completed his medical residency in anesthesiology; he was pulling an all-nighter studying for board exams when he heard voices coming from a nearby house commenting on him, on his abilities as a doctor, on his sanity. At first, he thought he was simply overhearing conversations through walls (much as Waugh's fictional alter ego first thought), but when no one else could hear the voices, he realized they were in his head. Moore went through a traumatic two years, including hospitalization for depression with auditory hallucinations.

"One tries to convince friends and family that you are being electronically harassed with voices that only you can hear," he writes in an e-mail. "You learn to stop doing that. They don't believe you, and they become sad and concerned, and it amplifies your own depression when you have voices screaming at you and your friends and family looking at you as a helpless, sick, mentally unbalanced wreck."

He says he grew frustrated with anti-psychotic medications meant to stop the voices, both because the treatments didn't work and because psychiatrists showed no interest in what the voices were telling him. He began to look for some other way to cope.

"In March of 2005, I started looking up support groups on the Internet," he wrote. "My wife would cry when she would see these sites, knowing I still heard voices, but I did not know what else to do." In 2006, he says, his wife, who had stood by him for three years, filed for divorce.

Moore, like other TIs, is cautious about sharing details of his life. He worries about looking foolish to friends and colleagues -- but he says that risk is ultimately worthwhile if he can bring attention to the issue.

With his father's financial help, Moore is now studying for an electrical engineering degree at the University of Texas at San Antonio, hoping to prove that V2K, the technology to send voices into people's heads, is real. Being in school, around other people, helps him cope, he writes, but the voices continue to taunt him.

Recently, he says, they told him: "We'll never stop [messing] with you."

A WEEK BEFORE THE TIS RALLY ON THE NATIONAL MALL, John Alexander, one of the people whom Harlan Girard holds personally responsible for the voices in his head, is at a Chili's restaurant in Crystal City explaining over a Philly cheese steak and fries why the United States needs mind-control weapons.

A former Green Beret who served in Vietnam, Alexander went on to a number of national security jobs, and rubbed shoulders with prominent military and political leaders. Long known for taking an interest in exotic weapons, his 1980 article, "The New Mental Battlefield," published in the Army journal *Military Review*, is cited by self-described victims as proof of his complicity in mind control. Now retired from the government and living in Las Vegas, Alexander continues to advise the military. He is in the Washington area that day for an official meeting.

Beneath a shock of white hair is the mind of a self-styled military thinker. Alexander belongs to a particular set of Pentagon advisers who consider themselves defense intellectuals, focusing on big-picture issues, future threats and new capabilities. Alexander's career led him from work on

sticky foam that would stop an enemy in his or her tracks to dalliances in paranormal studies and psychics, which he still defends as operationally useful.

In an earlier phone conversation, Alexander said that in the 1990s, when he took part in briefings at the CIA, there was never any talk of "mind control, or mind-altering drugs or technologies, or anything like that." According to Alexander, the military and intelligence agencies were still scared by the excesses of MK-ULTRA, the infamous CIA program that involved, in part, slipping LSD to unsuspecting victims. "Until recently, anything that smacked of [mind control] was extremely dangerous" because Congress would simply take the money away, he said.

Alexander acknowledged that "there were some abuses that took place," but added that, on the whole, "I would argue we threw the baby out with the bath water."

But September 11, 2001, changed the mood in Washington, and some in the national security community are again expressing interest in mind control, particularly a younger generation of officials who weren't around for MK-ULTRA. "It's interesting, that it's coming back," Alexander observed.

While Alexander scoffs at the notion that he is somehow part of an elaborate plot to control people's minds, he acknowledges support for learning how to tap into a potential enemy's brain. He gives as an example the possible use of functional magnetic resonance imaging, or fMRI, for lie detection. "Brain mapping" with fMRI theoretically could allow interrogators to know when someone is lying by watching for activity in particular parts of the brain. For interrogating terrorists, fMRI could come in handy, Alexander suggests. But any conceivable use of the technique would fall far short of the kind of mind-reading TIs complain about.

Alexander also is intrigued by the possibility of using electronic means to modify behavior. The dilemma of the war on terrorism, he notes, is that it never ends. So what do you do with enemies, such as those at Guantanamo: keep them there forever? That's impractical. Behavior modification could be an alternative, he says.

"Maybe I can fix you, or electronically neuter you, so it's safe to release you into society, so you won't come back and kill me," Alexander says. It's only a matter of time before technology allows that scenario to come true, he continues. "We're now getting to where we can do that." He pauses for a moment to take a bite of his sandwich. "Where does that fall in the ethics spectrum? That's a really tough question."

When Alexander encounters a query he doesn't want to answer, such as one about the ethics of mind control, he smiles and raises his hands level to his chest, as if balancing two imaginary weights. In one hand is mind control and the sanctity of free thought -- and in the other hand, a tad higher -- is the war on terrorism.

But none of this has anything to do with the TIs, he says. "Just because things are secret, people tend to extrapolate. Common sense does not prevail, and even when you point out huge leaps in logic that just cannot be true, they are not dissuaded."

WHAT IS IT THAT BRINGS SOMEONE, EVEN AN INTELLIGENT PERSON, to ascribe the experience of hearing disembodied voices to government weapons?

In her book, *Abducted*, Harvard psychologist Susan Clancy examines a group that has striking parallels to the TIs: people who believe they've been kidnapped by aliens. The similarities are often uncanny: Would-be abductees describe strange pains, and feelings of being watched or

targeted. And although the alleged abductees don't generally have auditory hallucinations, they do sometimes believe that their thoughts are controlled by aliens, or that they've been implanted with advanced technology.

(On the online forum, some TIs posted vociferous objections to the parallel, concerned that the public finds UFOs even weirder than mind control. "It will keep us all marginalized and discredited," one griped.)

Clancy argues that the main reason people believe they've been abducted by aliens is that it provides them with a compelling narrative to explain their perception that strange things have happened to them, such as marks on their bodies (marks others would simply dismiss as bruises), stimulation to their sexual organs (as the TIs describe) or feelings of paranoia. "It's not just an explanation for your problems; it's a source of meaning for your life," Clancy says.

In the case of TIs, mind-control weapons are an explanation for the voices they hear in their head. Socrates heard a voice and thought it was a demon; Joan of Arc heard voices from God. As one TI noted in an e-mail: "Each person undergoing this harassment is looking for the solution to the problem. Each person analyzes it through his or her own particular spectrum of beliefs. If you are a scientific-minded person, then you will probably analyze the situation from that perspective and conclude it must be done with some kind of electronic devices. If you are a religious person, you will see it as a struggle between the elements of whatever religion you believe in. If you are maybe, perhaps more eccentric, you may think that it is alien in nature."

Or, if you happen to live in the United States in the early 21st century, you may fear the growing power of the NSA, CIA and FBI.

Being a victim of government surveillance is also, arguably, better than being insane. In Waugh's novella based on his own painful experience, when Pinfold concludes that hidden technology is being used to infiltrate his brain, he "felt nothing but gratitude in his discovery." Why? "He might be unpopular; he might be ridiculous; but he was not mad."

Ralph Hoffman, a professor of psychiatry at Yale who has studied auditory hallucinations, regularly sees people who believe the voices are a part of government harassment (others believe they are God, dead relatives or even ex-girlfriends). Not all people who hear voices are schizophrenic, he says, noting that people can hear voices episodically in highly emotional states. What exactly causes these voices is still unknown, but one thing is certain: People who think the voices are caused by some external force are rarely dissuaded from their delusional belief, he says. "These are highly emotional and gripping experiences that are so compelling for them that ordinary reality seems bland."

Perhaps because the experience is so vivid, he says, even some of those who improve through treatment merely decide the medical regimen somehow helped protect their brain from government weapons.

Scott Temple, a professor of psychiatry at Penn State University who has been involved in two recent studies of auditory hallucinations, notes that those who suffer such hallucinations frequently lack insight into their illness. Even among those who do understand they are sick, "that awareness comes and goes," he says. "People feel overwhelmed, and the delusional interpretations return."

BACK AT THE PHILADELPHIA TRAIN STATION, Girard seems more agitated. In a meeting the week before, his "handlers" had spoken to him only briefly -- they weren't in the right

position to attack him, Girard surmises, based on the lack of voices. Today, his conversation jumps more rapidly from one subject to the next: victims of radiation experiments, his hatred of George H.W. Bush, MK-ULTRA, his personal experiences.

Asked about his studies at Penn, he replies by talking about his problems with reading: "I told you, everything I write they dictate to me," he says, referring again to the voices. "When I read, they're reading to me. My eyes go across; they're moving my eyes down the line. They're reading it to me. When I close the book, I can't remember a thing I read. That's why they do it."

The week before, Girard had pointed to only one person who appeared suspicious to him -- a young African American man reading a book; this time, however, he hears more voices, which leads him to believe the station is crawling with agents.

"Let's change our location," Girard says after a while. "I'm sure they have 40 or 50 people in here today. I escaped their surveillance last time -- they won't let that happen again."

Asked to explain the connection between mind control and the University of Pennsylvania, which Girard alleges is involved in the conspiracy, he begins to talk about defense contractors located near the Philadelphia campus: "General Electric was right next to the parking garage; General Electric Space Systems occupies a huge building right over there. From that building, you could see into the studio where I was doing my work most of the time. I asked somebody what they were doing there. You know, it had to do with computers. GE Space Systems. They were supposed to be tracking missile debris from this location . . . pardon me. What was your question again?"

Yet many parts of Girard's life seem to reflect that of any affluent 70-year-old bachelor. He travels frequently to France for extended vacations and takes part in French cultural activities in Philadelphia. He has set up a travel scholarship at the Cleveland Institute of Art in the name of his late mother, who attended school there (he changed his last name 27 years ago for "personal reasons"), and he travels to meet the students who benefit from the fund. And while the bulk of his time is spent on his research and writing about mind control, he has other interests. He follows politics and describes outings with friends and family members with whom he doesn't talk about mind control, knowing they would view it skeptically.

Girard acknowledges that some of his experiences mirror symptoms of schizophrenia, but asked if he ever worried that the voices might in fact be caused by mental illness, he answers sharply with one word: "No."

How, then, does he know the voices are real?

"How do you know you know anything?" Girard replies. "How do you know I exist? How do you know this isn't a dream you're having, from which you'll wake up in a few minutes? I suppose that analogy is the closest thing: You know when you have a dream. Sometimes it could be perfectly lucid, but you know it's a dream."

The very "realness" of the voices is the issue -- how do you disbelieve something you perceive as real? That's precisely what Hoffman, the Yale psychiatrist, points out: So lucid are the voices that the sufferers -- regardless of their educational level or self-awareness -- are unable to see them as anything but real. "One thing I can assure you," Hoffman says, "is that for them, it feels real."

IT LOOKS ALMOST LIKE ANY OTHER SMALL POLITICAL RALLY IN WASHINGTON. Posters adorn the gate on the southwest side of the Capitol Reflecting Pool, as attendees set up a

table with press materials, while volunteers test a loudspeaker and set out coolers filled with bottled water. The sun is out, the weather is perfect, and an eclectic collection of people from across the country has gathered to protest mind control.

There is not a tinfoil hat to be seen. Only the posters and paraphernalia hint at the unusual. "Stop USA electronic harassment," urges one poster. "Directed Energy Assaults," reads another. Smaller signs in the shape of tombstones say, "RIP MKULTRA." The main display, set in front of the speaker's lectern has a more extended message: "HELP STOP HI-TECH ASSAULT PSYCHOTRONIC TORTURE."

About 35 TIs show up for the June rally, in addition to a few friends and family members. Speakers alternate between giving personal testimonials and descriptions of research into mind-control technology. Most of the gawkers at the rally are foreign tourists. A few hecklers snicker at the signs, but mostly people are either confused or indifferent. The articles on mind control at the table -- from mainstream news magazines -- go untouched.

"How can you expect people to get worked up over this if they don't care about eavesdropping or eminent domain?" one man challenges after stopping to flip through the literature. Mary Ann Stratton, who is manning the table, merely shrugs and smiles sadly. There is no answer: Everyone at the rally acknowledges it is an uphill battle.

In general, the outlook for TIs is not good; many lose their jobs, houses and family. Depression is common. But for many at the rally, experiencing the community of mind-control victims seems to help. One TI, a man who had been a rescue swimmer in the Coast Guard before voices in his head sent him on a downward spiral, expressed the solace he found among fellow TIs in a long e-mail to another TI: "I think that the only people that can help are people going through the same thing. Everyone else will not believe you, or they are possibly involved."

In the end, though, nothing could help him enough. In August 2006, he would commit suicide.

But at least for the day, the rally is boosting TI spirits. Girard, in what for him is an ebullient mood, takes the microphone. A small crowd of tourists gathers at the sidelines, listening with casual interest. With the Capitol looming behind him, he reaches the crescendo of his speech, rallying the attendees to remember an important thing: They are part of a single community.

"I've heard it said, 'We can't get anywhere because everyone's story is different.' We are all the same," Girard booms. "You knew someone with the power to commit you to the electronic concentration camp system."

Several weeks after the rally, Girard shows up for a meeting with a reporter at the stately Mayflower Hotel in Washington, where he has stayed frequently over the two decades he has traveled to the capital to battle mind control. He walks in with a lit cigarette, which he apologetically puts out after a hotel employee tells him smoking isn't allowed anymore. He is half an hour late -- delayed, he says, by a meeting on Capitol Hill. Wearing a monogrammed dress shirt and tie, he looks, as always, serious and professional.

Girard declines to mention whom on Capitol Hill he'd met with, other than to say it was a congressional staffer. Embarrassment is likely a factor: Girard readily acknowledges that most people he meets with, ranging from scholars to politicians, ignore his entreaties or dismiss him as a lunatic.

Lately, his focus is on his Web site, which he sees as the culmination of nearly a quarter-century

of research. When completed, it will contain more than 300 pages of documents. What next? Maybe he'll move to France (there are victims there, too), or maybe the U.S. government will finally just kill him, he says.

Meanwhile, he is always searching for absolute proof that the government has decoded the brain. His latest interest is LifeLog, a project once funded by the Pentagon that he read about in Wired News. The article described it this way: "The embryonic LifeLog program would dump everything an individual does into a giant database: every e-mail sent or received, every picture taken, every Web page surfed, every phone call made, every TV show watched, every magazine read. All of this -- and more -- would combine with information gleaned from a variety of sources: a GPS transmitter to keep tabs on where that person went, audiovisual sensors to capture what he or she sees or says, and biomedical monitors to keep track of the individual's health."

Girard suggests that the government, using similar technology, has "catalogued" his life over the past two years -- every sight and sound (Evelyn Waugh, in his mind-control book, writes about his character's similar fear that his harassers were creating a file of his entire life).

Girard thinks the government can control his movements, inject thoughts into his head, cause him pain day and night. He believes that he will die a victim of mind control.

Is there any reason for optimism?

Girard hesitates, then asks a rhetorical question.

"Why, despite all this, why am I the same person? Why am I Harlan Girard?"

For all his anguish, be it the result of mental illness or, as Girard contends, government mind control, the voices haven't managed to conquer the thing that makes him who he is: Call it his consciousness, his intellect or, perhaps, his soul.

"That's what they don't yet have," he says. After 22 years, "I'm still me."

Sharon Weinberger is a Washington writer and author of *Imaginary Weapons: A Journey Through the Pentagon's Scientific Underworld*.

Mind Control Madness

By Kevin Poulsen, Senior Editor
February 05, 2007

Posted at: http://blog.wired.com/27bstroke6/2007/02/mind_control_ma.html

The Washington Post Magazine is open minded to the possibility that thousands of people are victims of government mind control experiments. Too open minded.

I once had a cellmate in federal lockup who was convinced the government, with the help of university scientists, had planted a microchip in his brain. He also heard people talking about him in the heating vents -- he'd sometimes yell back at them -- and believed that everybody around him, including me, had secret radio receivers on which they were listening to a private 24-7 broadcast devoting to spreading scurrilous lies about his character.

In every other way he was perfectly normal, and a genuinely nice guy. He was in custody for serving as a lookout in a marijuana smuggling operation, and he had a full and intelligent comprehension of his legal situation, and the statutes and cases that affected him. (No, he was not offering an insanity defense). If you didn't get him on the subject of the microchip or the hidden radios, you'd have no idea there was anything wrong with him, and he'd beat you at chess.

So perhaps I should write a 7,000 word story "investigating" the possibility that there really was a microchip in his brain.

Some of his beliefs are demonstrably false -- I had no secret radio receiver, and there were no voices in the vents -- so I'll gloss over those, or bury them deep in the article. That'll leave more space to write about how common his belief is: lots of people think the government has planted microchips in their brains. Surely they can't all be wrong!

The nice thing about this line of journalism is that it offers limitless material. In the '50s and '60s, mental patients believed that Russians were conspiring against them. In the '70s, they tended to think that NASA had placed a machine on the moon that controlled their brains. In the 80s it was microchips, and in the '90s it was the internet. Who's to say the CIA can't control people's appendages through their web pages. After all, as my investigative reporting will reveal, the internet is a product of military research funding.

In 2007, the delusion de jour is that the government is beaming voices into victims' minds. At Wired News, we get e-mail from self-described victims of this attack from time to time. The Washington Post Magazine story by Sharon Weinberger raises the possibility that it's all true.

Weinberger's argument rests largely on the fact that the people she interviews don't seem mentally ill to her. Her article begins with that point. "If Harlan Girard is crazy, he doesn't act the part ... Girard is wearing pressed khaki pants, expensive-looking leather loafers and a crisp blue button-down. ... At 70, he appears robust and healthy -- not the slightest bit disheveled or unusual-looking."

The word "crazy" works well here because it's an all-or-nothing proposition. If you're crazy, you're incoherent, unkempt, odd-looking, and you can't dress yourself. Since none of the people she interviewed fit that description, there must be a germ of truth in their beliefs. Right?

Of course, as with my former celly, victims of mental illness aren't always the wild-eyed, straightjacket-wearing cartoon characters that Weinberger seems to think they are. I'm not a doctor, and I don't claim to have any knowledge of her interview subjects, but 5,000 words past her description of how normal Girard looks, she describe meeting him at a train station, where he suspects that "40 or 50 people" are there just to spy on him.

The other prong in her argument is the observation that the government really is conducting research into projecting sound using microwaves. There's even a patent. This is the meat of her article, and there's some fine reporting here. But with respect to her thesis, it is pure nonsense. The fact that there really were moon launches doesn't prove that the government was controlling people's thoughts from the lunar surface. Schizophrenics draw their delusions from a common paranoiac zeitgeist, distilled from real life events, news articles, books, and, these days, websites.

That's what disturbs me the most about the article. By pretending that these people might actually be the victim of a secret government conspiracy, Weinberger and the Washington Post Magazine are contributing to that zeitgeist. This does a disservice to the victims of mental illness and their families.

If Weinberger really think that somebody she interviewed is receiving microwave messages in their head from government spooks, she should nail that story down tight and collect her Pulitzer. (Why not bring a radio spectrum analyzer to their homes?) Instead, it looks a lot like she exploited her sources' delusions to add color to an entirely unrelated story on government mind control research. For shame.

Outlaw nonconsensual human experiments now

Bulletin Staff

About 15 years ago, a reporter at the *Albuquerque Tribune* discovered [evidence](#) that during the Cold War, the U.S. government carried out radiation experiments on U.S. citizens without their knowledge or consent, all under the shadow of classified research. When the story hit the newswires, the U.S. public was outraged. President Bill Clinton responded by establishing the [Advisory Committee on Human Radiation Experiments](#) (ACHRE), calling on it to review Washington's past actions and recommend steps that would prevent such heinous human experiments from ever taking place again.

The committee made their [recommendations](#) in a 1995 report; and although Clinton issued a [memorandum](#) two years later that included several ACHRE prescriptions, bureaucratic delays kept it from being properly approved before he left office. The Department of Health and Human Services finally published it as an interim proposal in the Federal Register in 2002, but it remains unapproved by the appropriate agencies and departments.

So while it seems crazy, it's true: Today, in a country that for the last eight years has been defined by questionable intelligence-gathering techniques and interrogation methods, the U.S. government is no more restricted in carrying out nonconsensual, classified research on human subjects than it was after World War II. Thus, it's time for the Obama administration to reexamine the guidelines for classified experimentation on human subjects and close any loopholes that would allow a person to be unknowingly subject to experimentation. In fact, a prohibition on waiving informed consent in classified human-subject experiments should be the centerpiece of any new legislation—the waiver of this right being perhaps the most offensive aspect of the Cold War research programs.

Currently, the 1991 [Federal Policy for the Protection of Human Subjects](#) is the binding regulation on human-subject research for 17 federal agencies including the military and the intelligence agencies. Although it outlines the guidelines for informed consent, it also states, "Unless otherwise required by law, department or agency heads may waive the applicability of some or all of the provisions of this policy." In other words, a person participating in an experiment must be informed and give his consent unless a high-level government official doesn't think it is necessary. Not surprisingly, this authority doesn't stop with the heads of agencies and departments. The president also has the power to waive or modify these provisions through a presidential directive, which he can issue at any time, refuse to make public, and do without any person's or body's approval.

Therefore, until a federal statute that secures the right of informed consent for anyone subjected to classified human experimentation is passed by the legislature and signed into law by the president, the U.S. government has the power to carry out research projects without his consent and without informing the participants of the dangers or future complications.

Is the United States carrying out human-subject research without consent right now? We don't know. But speculation about the future of research and experimentation doesn't inspire confidence. Jonathan Moreno, a biomedical expert and author of *Undue Risk: Secret State Experiments on Humans*, writes, "Among the next generation of weapons is one that may involve a different sort of radiation than that emitted by atomic fission: microwaves. Electromagnetic waves may be used to disrupt an enemy soldier's central nervous system, to cause epileptic seizures." Anyone who doubts that the U.S. military may be considering such research need only consult a 2006 [navy directive](#) that includes guidelines for waiving consent and suggests

the potential for research involving “severe or unusual intrusion, either physical or psychological, on human subjects (such as consciousness-altering drugs or mind-control techniques).”

In order to overcome more than 50 years of failed reforms, new approaches to human subject protections for classified experiments need to be developed, and troubling questions need to be answered. How could this have happened and happened for so long? As we reflect on potential research and consider the ongoing debate regarding torture, the power of the executive branch, and the future of U.S. security, the need for strong, legally binding regulations governing human-subject research is undeniable. It’s time, with a new administration that condemns torture of any kind, to establish regulations governing *all* human-subject protections in classified experiments and to ensure that no person, regardless of position, can take away a person’s right to consent.

Interview With Elizabeth Rauscher: A physicist ahead of her time

Sponsored by Mindjustice.org Copyright. Not for reposting.

[Mind Justice Home Page](#)

On December 3, 2011, Dr. Elizabeth Rauscher was interviewed in Davis, California. An excerpt of the Rauscher interview is posted [here](#).

The interview includes Rauscher's scientific look back at the issue of electromagnetic (EMR) mind control. Significantly, Rauscher discussed how she became convinced that electromagnetic radiation (EMR) could cause behavioral and biological effects on humans, despite the widespread belief to the contrary. Rauscher commented on classified EMR weapons research and U.S. secrecy efforts that hindered her own bioelectromagnetics research. Bioelectricity, now called bioelectromagnetics is the study of the electromagnetic forces generated by living organisms, and the effects of external electromagnetic forces and fields upon living organisms.^[1] Bioelectromagnetics is the scientific basis for some EMR weapons. In the 1980s, Rauscher conducted a key mind control experiment in which "simple images can be impressed on the conscious mind without going through the visual system at all."^[2] Dr. Robert Becker, two time Nobel Prize nominee and bioelectromagnetics researcher ^[3] described Rauscher's experiment as "a substantial step forward in understanding how the visual system works," and as having the potential to be developed into a powerful weapon.

By comparing some of today's cutting edge areas of neuroscience research to the science behind Rauscher's experiment--bioelectromagnetics--the scientific outline of powerful secret brain weapons are becoming apparent. For example, neuroscientists are only beginning to discover from the study of brain signals "that we have a direct way to visualize what you are seeing. . . . it raises the possibility that we can actually see what others are thinking or dreaming. We're not there but we're moving in those directions."^[4] Could weapons based on this neuroscience research already be developed? Most neuroscientists dismiss the idea.

However, leading ethicists are recommending public discussions are to establish the ethics of new 'neuroweapons'; called mind control weapons during the Cold War.^[5] Neuroweapons are weapons that target the brain and nervous system.^[6] Neuroscientists agree that advanced neuroweapons capable of reading thoughts or targeting the enemy remotely are still science fiction, although they will be scientifically possible some day: "To achieve truly precise mind-reading and control, neuroscientists must master the syntax or set of rules that transform electrochemical pulses coursing through the brain into perceptions, memories, emotions and decisions."^[7] However, as Rauscher's interview illustrates, there seems to be one area of neuroscience--bioelectromagnetics--that may be essential for solving how the brain works and that has been classified during the Cold War. Most neuroscientists have been unaware of or have discounted the importance of bioelectromagnetics. With a closer look at; Rauscher's key mind control experiment, some of the history of bioelectromagnetics, secret EMR neuroweapons research and the neuroscience related to bioelectromagnetics, it becomes more likely that remote advanced EMR neuroweapons may already be developed.

**Interview With Elizabeth Rauscher:
A physicist ahead of her time**

by Cheryl Welsh, director, Mindjustice.org

I. Who is Elizabeth Rauscher, PhD?

Dr. Rauscher is a really nice and extremely smart physicist. In the 1970s, she had a Q government security clearance for her research on the cosmos with physicist Edward Teller, father of the hydrogen bomb. She turned down offers to work on Star Wars and today she develops medical devices based on bioelectromagnetics to enhance health. In 2011, MIT professor David Kaiser published the book *How the Hippies Saved Physics: science, counterculture and the quantum revival*.^[8] *Scientific American*, *New York Times* and other major news sources have reviewed this fascinating book about Rauscher and George Weissmann, graduate students at Berkeley, California. Rauscher and Weissmann founded the Fundamental Fysics Group (Group) in 1975, an informal weekly discussion group. Formal physics education did not include discussion groups even though the pioneers of quantum mechanics - Werner Heisenberg, Albert Einstein, Wolfgang Pauli, Niels Bohr and Erwin Schrödinger - debated endlessly in their day. Rauscher was ahead of her time; for example, participants of the Group were almost all men and as shown below, her 1980s key mind control experiment went beyond even today's cutting edge neuroscience.

In the 1970s, Californians were discussing popular topics such as psychedelic drugs, para-psychology, telekinesis, ESP and a search for extra-terrestrial communication. The Group debated it all with an open-minded attitude, unlike most of their colleagues. The Group were trained scientists interested in a well-recognized feature of quantum theory, non-locality or entanglement, which basically implies that, even when separated, two elementary particles can still have an instantaneous effect on each other. When this phenomenon was originally discovered in the 1930s, Einstein did not like it, calling it "spooky actions at a distance." Luckily, quantum physics became understandable to the general public when Kaiser detailed this aspect of quantum theory on one of the episodes of the 2011, PBS NOVA series *The Fabric of the Cosmos* with Brian Greene.

The Group sessions contributed to the field of quantum information science; they helped make possible a world in which bankers and politicians shield their most critical information with quantum encryption. The Group and a few other isolated physicists contributed to how we think about information, communication, computation, and the subtle workings of the microworld today.

Rauscher's key mind control experiment, however, is not based on quantum physics but on bioelectromagnetics. As Freeman Dyson, a theoretical physicist, explained, mind reading of the future will not require quantum physics: "The ancient myth of telepathy induced by occult and spooky action-at-a-distance would be replaced by a prosaic kind of telepathy induced by physical tools."^[9] Dyson stated that detailed observation or control of a brain will emerge before the twenty-first century ends and will require two new tools; first, the direct conversion of neural signals into radio signals and vice versa; and second, the placement of microscopic microwave transmitters and receivers inside the brain.^[10] Rauscher's experiment was a step towards doing just that, only better. Rauscher directed EMR magnetic signals into a CNN news reporter's brain without microwave transmitters and receivers, thus providing evidence of a scientific basis for EMR--without brain implants--for direct communication with the brain.

Rauscher has had an inspiring career, often questioning authority, asking unconventional questions and delving into brain science. Rauscher's interview reflects her remarkable life, intelligence and enduring humanity. The next sections discuss background information for the interview.

II. Rauscher's mind control experiment

A 1985 CNN news broadcast, featured an experiment by Rauscher and her husband, Dr. William Van Bise.^[11] Rauscher and Van Bise directed magnetic signals into the brain of news reporter Chuck DeCaro. DeCaro was blindfolded and his ears were blocked for sound in an experiment using Soviet specifications for equipment capable of generating specific but very weak magnetic signals designed to cause visual "hallucinations." When the magnetic signals were directed at DeCaro, he stated: "A parabola just went by. . . . I could see wave forms changing shape as they went by." The experiment on DeCaro was successful and it was an indication that remote EMR mind control weapons were scientifically possible. "In three weeks, I could put together a device that would take care of a whole town," Van Bise commented. Rauscher discussed Van Bise's comment in her 2011 interview and explained what he meant by the comment.

The CNN program also featured Becker, mentioned above, who commented that the Rauscher experiment would be a powerful weapon if used on fighter pilots while trying to fly. Becker wrote:

Science "explains" the visual system in simplistic terms that are quite inaccurate. Photons of light are focused on the retina where they form an image of the external world. The "pattern" of this image is transferred to impulses in the optic nerves, and it is ultimately expressed as a similar pattern on the optic cortex at the back of the brain. This process is much like the process a computer uses to form a graphic image on the screen. This graphic image is expressed as a specific collection of individual dots: the more dots there are and the closer together they are, the more realistic the image will be. We call this "image digitizing."

If things were this simple we should be able to electrically stimulate the optic cortex with a pattern of electrodes arranged, for example, in the shape of the letter A, and the subject would report seeing the visual image of the letter A. The fact of the matter is that even the letter A cannot be perceived in this way; the patient merely reports the sensation of light. We expect that somewhere in the brain such a patterning is expressed--on the "computer screen of the mind," for example. But we have not found the screen. This may be because it exists only in the state of consciousness, not in the physical brain.

I know of one experimental circumstance in which simple images can be impressed on the conscious mind

without going through the visual system at all. This technique was discovered by Dr. Elizabeth Rauscher, a physicist, and William Van Bise, an engineer. It uses magnetic fields generated by two coils of wire, each pulsing at a slightly different frequency and directed so as to intersect at the head of the subject

When two beams of electromagnetic energy with different frequencies intersect at some point in space, a third frequency is formed. This frequency is the difference between the two original frequencies and is called either the "difference" or the "beat" frequency. For example, if one beam had a frequency of 100 kHz and the other a frequency of 99.99 kHz, the difference would be 0.01 kHz, or 10 Hz. This is a useful technique for producing extremely low frequencies (ELF) within a small volume located a distance away from the original transmitters. In Van Bise and Rauscher's experiment, the difference frequencies were always in the ELF range. The size of the volume in which this occurs depends upon the diameter of the two beams. (This technique will be discussed further in a later chapter.)

Van Bise and Rauscher's blindfolded subjects "saw" such simple figures as circles, ellipses, or triangles, which could be changed by altering the frequency of one of the coils. The coils were several feet from the subject's head. The magnetic field strength from the coils were so small that no electrical currents could have been generated in the brain, and the control electronics were located in another room.

This technique seems to bypass the entire visual system as we know it, acting directly at the interface between the organic brain and the conscious perception of visual images. If this supposition is even partially correct, it is highly unlikely that the conscious perception level is based upon a digital or nerve-impulse system. The technique could not possibly have stimulated nerve impulses in any part of the brain, because the field strengths were far too low and the ELF frequency cannot produce such stimulation. It is probable that this sensitivity to such low-strength, low-frequency magnetic fields requires the presence of semiconducting DC elements.^[12]

Becker explained that Rauscher's experiment raised a radical idea that went against conventional neuroscience thinking: "it is highly unlikely that the conscious perception level is based upon a digital or nerve-impulse system." Becker's suppositions about the visual system were based on neuroscience research established prior to World War II, below. Furthermore, subsequent neuroscience research has extended Becker's suppositions and his radical idea about Rauscher's experiment. The next section compares Rauscher's experiment to cutting edge neuroscience; this illustrates how conventional neuroscience overlooked an important area of neuroscience research—bioelectromagnetics and how the radical idea raised in Rauscher's experiment is proving to be true.

Government mind control was in the news in the 1970s and 1980s

III. Rauscher's experiment and cutting edge neuroscience

The "image digitizing" that Becker discussed above was described by Dr. Bruce Rosen, who spoke at President Obama's Bioethics Commission in 2011 on the state of neuroscience today.^[13]

The next thing I would like to talk about very quickly is fMRI. Functional brain imaging really started now two decades ago with this work from Jack Belliveau published in Science. But, of course, since that time has really evolved. I'll give you just one example to give you a state of the current technology. Let's say that we know there is a direct relationship between your primary visual cortex, the part of your brain that first processes visual images, and your retina, the back of your eye, what it's seeing.

Let's say we wanted to imprint this letter M on the back of your cortex. We would have to show your retina an M. It would be slightly distorted because there is kind of a warping between the retina and the brain but

there is this simple mapping. We actually did the experiment and we showed subjects a figure that looked like this and we wanted to see whether we could — what we would see in the brain.

When you first look at the brain with fMRI you typically see pictures like this, grayscale anatomy. The bright spots are the part of the brain that turned on. It doesn't really look like much of anything. If you look at it on the folded surface of the brain, again you almost get the sense that there may be something there of interest.

But hopefully this next slide will show when you actually look at it on the surface when you blow up the brain. Basically take the raisin and turn it back into the grape. There's our M right on the back of the brain. The point of this is that we have a direct way to visualize what you are seeing. Of course, because we know that the visual cortex activates when we imagine visual scenes, we know it activates when we're dreaming, it raises the possibility that we can actually see what others are thinking or dreaming. We're not there but we're moving in those directions.

It is interesting to note that Rosen's experiment involving the "M" described the same neuroscience research that Becker described in 1985 involving an "A." Rosen's experiment 'read' the brain signals to see the visual image while Rauscher's experiment beamed magnetic signals into the reporter's brain and created a visual image. Rosen and Rauscher have approached the study of how the brain processes human vision from two different perspectives; Rosen from a conventional neuroscience approach and Rauscher from a physics and bioelectromagnetics approach. In the next section, the conventional neuroscience behind Rosen's experiments is briefly presented, followed by a section on Rauscher and Becker's bioelectromagnetics approach. The two approaches are then compared and contrasted.

IV. Conventional neuroscience

Conventional neuroscience has focused on the study of neurons as the only means of brain communication. The research on vision as Rosen described involved the study of neuronal brain signaling. Since Ramon y Cajal's Nobel Prize winning discovery of the neuron at the beginning of the twentieth century, his neuron doctrine has prevailed.^[14] The 'neuro-centric' view of the brain is implicit in the name of the discipline--neuroscience--which had its beginnings in the 1960s.^[15] The defining characteristic of a neuron is its ability to transmit rapid electrical signals in the form of action potentials. The longstanding belief is that each of the brain's 100 billion neurons communicate strictly by a digital code.^[16] As in a computer, digital coding transmits "enormous amounts of data at high speed, but only if the information can be reduced to yes-no, on-off bits--the digits 1 and 0."^[17]

In the 1920s, it was discovered that the transmission of the nerve impulse included the release of chemicals at the nerve ending, called the synapse. From then on, biological thinking focused on action potentials and synapses and disregarded bioelectricity. "The drug industry had developed soon after the Civil War. . . . The increasing reliance on drugs fed and fed off of the ascendancy of biochemistry."^[18] Electrotherapeutics, the use of electricity to treat any ailment, was practiced by prominent doctors but some of the medical electrical devices were proven to be quackery and the whole field of bioelectricity declined.^[19] Consequently, the study of the brain has remained focused on the neuron doctrine and the study of the action potential and the biochemical synapse.

The following example further illustrates the conventional neuroscientific approach to the study of vision. Neuroscientists today describe a technique of almost reading thoughts using fMRI and computer modeling. As Rosen described, there is a direct relationship between the image projected onto the back of the eye and the unprocessed signals of the image that start to travel through the brain. Likewise, there have been cat experiments involving the study of neuronal signals received from the cat's eye but before the brain significantly processes the signals; these experiments have successfully recorded the unprocessed brain signals of what the cat sees in real time without the use of fMRI. A 2011 article described the cat experiments:^[20]

As reported on BBC News Online last week, a team of US scientists have wired a computer to a cat's brain and created videos of what the animal was seeing. By recording the electrical activity of nerve cells in the thalamus, a region of the brain that receives signals from the eyes, researchers from the University of California at Berkeley were able to view these shapes. The team used what they describe as a "linear decoding technique" to convert the signals from the stimulated cells into visual images. . . .

By being able to tap directly into the brain and extract a visual image the researchers have produced a "brain interface" that may one day allow the control of artificial organs and indeed machines by thought alone. It is also conceivable that, given time, it will be possible to record what one person sees and "play it back" to someone else either as it is happening or at a later date.^[21]

The next section contrasts the conventional neuroscience approach of the study of neuronal signals to the bioelectromagnetics approach in Rauscher's experiment and discusses the importance of this difference.

V. Bioelectromagnetics and its importance to neuroscience

Glia are another type of brain cell. 'Glia do not fire action potentials like neurons, but instead surround and ensheath neuronal cell bodies, axons and synapses throughout the nervous system.'^[22] Glia make up over half of the brain cells, yet until recently they were believed to have only a passive supporting role, consequently, the study of glia has been completely ignored by neuroscientists.^[23] However, in the last decade, neuroscientists have described glia research and their excitement 'about the prospect that more than half the brain has gone largely unexplored and may contain a trove of information about how the mind works.'^[24] As Becker mentioned above, the brain communicates with neuronal digital brain signals and it also seems to communicate with analog EMR signals. Analog signals occur outside of the neuron and are electromagnetic signals coded by strength of current, direction of flow and slow, wave-like variations for precise brain control.^[25] Based on neuroscience research in the pre-World War II era, Becker suggested that the brain may depend on the synergy of both types of brain signals for higher brain functions such as vision, memory and thinking.

The pre-World War II research that Becker referred to included computer pioneer, John von Neuman, a group of Harvard Medical School scientists and a group of Massachusetts Institute of Technology (MIT) scientists who around 1939 established that the interaction of neurons and glia are the basis for thought processes and how the brain works.^[26] This required a combination of both the digital signals of neurons and analog brain signals outside neurons. "The digital system would transfer sensory and motor information, but the processing of that information--memory and recall, thought, and so on--would be accomplished by the synergism of both methods."^[27] If such a hypothesis proved to be true, the implications for national security would be tremendous; it would have been scientifically possible to develop advanced remote mind control weapons in the 1950s. Significantly, Von Neuman would go on to be well connected to secret atomic bomb research. With the threat of communist mind control in the 1950s, it can be argued that Von Neuman's hypothesis would not have been overlooked by the researchers conducting CIA mind control experiments at that time. The analog/digital brain research was further developed in the 1940s by prominent neuroscientists including Wilder Penfield^[28] who established that the electrical 'current was transmitted by structures *outside* the neurons.'^[29]

Neurophysiologists Ralph Gerard and Benjamin Libet were also "convinced that the simplistic concept of the nerve impulse being the sole neural mechanism was inadequate to explain the complex functions of the brain. During the 1930s and 40s they reported evidence for actual electrical currents flowing outside of the nerve cells proper in the brain."^[30] The research conflicted with neuron doctrine and the "majority of neurophysiologists went on measuring the action potentials and tracing out fiber pathways in the brain."^[31] In the early 1960s, Robert Galambos, a neuroscientist, hypothesized that the brain's "two cellular components--the neurons and the glia--mutually collaborate to produce behavior."^[32] and "his superiors at Walter Reed [Army Institute of Research] found the theory so radical that he was soon job-hunting."^[33] Several scientists subsequently reported similar experiences. By contrast, some bioelectromagnetics researchers such as Becker and others extended Von Neuman's hypothesis with further bioelectromagnetics research. Today, some neuroscience research has confirmed and extended Von Neuman's 1930s hypothesis. For example, some neuroscientists have concluded that the analog-digital nature of brain communication will need to be considered in order to achieve "a truly in depth understanding of the brain and its disorders:"

Contrary to popular belief, brain cells use a mix of analog and digital coding at the same time to communicate efficiently, according to a study by Yale School of Medicine researchers published this week in *Nature*. . . .

"It's as if everyone thought communication in the brain was like a telegraph, but actually it turned out to be more similar to a telephone," he [David McCormick, professor in the Department of Neurobiology] said. . . .

Neurons receive input from other cells largely through synaptic contacts on their dendrites and cell bodies. The release of neurotransmitters at these synapses causes the voltage inside the cell receiving the transmitters to fluctuate continuously. Once this voltage passes a threshold, an action potential is generated. The action potential is a specialized waveform known to be able to travel down the axon, or output portion of the cell.

McCormick's group demonstrated that the analog signal present in the cell body also propagates down the axon and influences synaptic transmission onto other neurons. As the voltage on the sending cell becomes more positive, the amplitude of the subsequent transmission to the receiving cell, mediated by an action potential, is enhanced. This means that the waveform generated in the receiving neuron is not just determined by the digital pattern of action potentials generated, but also by the analog waveform occurring in the sending neuron.^[34]

In the 1930s and 1940s, Gerard and Libet's research, mentioned above, found similar findings as McCormick's group; Gerard and Libet "demonstrated that such currents [electric currents] influenced the way in which the neurons operated, but their work evoked little interest, not only because it flew in the face of established dogma [the neuron doctrine] but also because the measurement of direct currents of such small magnitude was extremely difficult."^[35] Likewise, as Becker wrote in 1985: "It is now known that glial cells have electrical properties that, while not the same as nerve impulse transmission, enable them to play a role in communication with the body."^[36] Thus, the research of Rauscher, Becker, McCormick and several others suggests that Von Neuman's 1930s hypothesis is scientifically valid, although it remains unproven.

This line of research suggests that bioelectromagnetics may be an important but understudied and under funded area of promising neuroscience research. Both the neuronal and bioelectromagnetics approach seem to be critical to solving how the higher brain functions such as vision work, although clearly, for decades, neuroscientists have focused on a neuronal approach. Significantly, this suggests that the bioelectromagnetics research related to neuroscience has been scientifically valid for decades, although it has been overshadowed by the neuronal approach to neuroscience and its continuing focus on the neuron doctrine. Likewise, the 1950s classified mind control research could also have resulted in further promising bioelectromagnetics research related to neuroscience and EMR neuroweapons; therefore it is not farfetched to surmise that advanced EMR neuroweapons may already be developed.

VI. Bioelectromagnetics and its importance to national security

During her 2011 interview, Rauscher explained that in the 1970s, like nearly all scientists, she was taught that EMR could not affect behavior and body functions. However, Rauscher became convinced by her personal experience of such effects and also by scientific evidence that EMR could have an impact on the behavior and biology of humans. Moreover, both Becker and Rauscher have recounted how secret government EMR weapons research interfered with their bioelectromagnetics research. The 1950s CIA mind control research included EMR remote mind control research and the related classified research has continued.^[37] In the 1980s, there was much talk among bioelectromagnetics researchers about EMR mind control effects and how advanced the secret EMR government research might be. Both Becker and Rauscher had lost government funding and Rauscher was told not to talk publicly about her promising research. Furthermore;

[Becker] always maintained that both the US and Russian government were very much involved in such research. But he also felt that there was a deliberate attempt by authorities to cover up these clandestine activities by means of deliberate disinformation tactics. These included weird and bizarre stories that were leaked to the public for one purpose: to muddy the waters, to make the whole question of mind control seem absolutely unbelievable.^[38]

As the Rauscher interview suggests, Becker, Rauscher, Van Bise and others seemed to have stumbled onto an area of neuroscience research involving bioelectromagnetics and national security. In a 1983 academic science journal, Samuel Koslov, a researcher at the Johns Hopkins University Applied Physics Laboratory, presented "a radical proposal" in an academic journal article. Koslov wrote about the bioelectromagnetics research presented at a conference:

The observations and hypotheses that have been presented during this conference are converging to a level of understanding of cellular behavior that implies the external electric fields can, in fact, become a key to the cellular control console. The implications, social, economic, and even military are enormous. . . .

If much of what we have heard is indeed correct, it may be no less significant to the nation than the prospects that faced the physics community in 1939 when the long-time predicted fissionability of the nucleus was actually demonstrated. . . . When we're in a position to do so in terms of our proofs, I would propose that an analogous letter is required. I believe we are on the verge of a total new understanding of the living system and I believe that we are obligated to do something about accelerating its applications.^[39]

Koslov was referring to the famous letter Albert Einstein wrote to President Roosevelt in 1939 advocating for research to build an atomic bomb before Nazi Germany did. A 1984 BBC documentary included an interview of both Becker and Koslov, who had also worked on Project Pandora, a super-secret Pentagon project on EMR mind control:

TV Announcer: But when governments want to develop new weapons systems, moral considerations are almost invariably one of the first casualties. The last time scientific ethics clashed so directly with the goals of governments and politicians was in the 1940s, when Einstein and a group of other scientists decided to tell President Roosevelt about the scarcely believable destructive power of a theoretical device known as the atom bomb. The result of that fact was Hiroshima, Nagasaki and, a few years later, when the Soviet Union began to catch up, the establishment of the present system of reciprocal terror known as nuclear deterrence.

This 1976 American intelligence report noted that the Soviets saw great potential in use of microwaves for disorientating military and diplomatic personnel. It also noted that the Soviets had found a microwave frequency to cause heart seizure in animals. They added that a frequency could be found to do the same to human beings.

Narrator: For scientists, there seem to be two major possibilities. First, that people's behavior, that their health can be affected by low level [EMR] fields. And the second one is that there's a potential for creating a new genre of weapons that presumably are extremely sensitive areas for government. It seems to me inconceivable that there isn't an area of research that is totally black.

Koslov: You know back in 1965, there were a lot of hypotheses and conjectures about the Pandora classified program to find out what the hell was going on. Since then, I think we have found generally that there doesn't seem to be very much possibility here. I don't know of any US government program that is seriously looking at that. I cannot exclude, you know, someone, for example, in the navy department; we

have here something like 7,000 test units in research and exploratory development. And each of those test units perhaps consists of two or three or more separate scientific program projects. Somewhere buried somewhere, there could be somebody doing it. But I think in general, at this point in time, we don't think there is too much possibility in EMR weapons potential.

Becker: The United States Navy may very well not have any program whatsoever. On the other hand, it's equally valid to have such a program being conducted in even greater secrecy than the Manhattan Project was conducted. And the best cover I could think of for that would be for the United States to portray itself to the rest of the world as a nation that was discounting the possibility of electromagnetic weapons entirely, based upon its best scientific evidence.^[40]

Koslov's denial of any weapons potential of EMR was an illogical reversal of his stated position in the academic science journal a year earlier. This reversal of opinion begins to make sense with the possibility that Becker was right about an EMR weapons project with greater secrecy than the Manhattan Project and that Koslov was told by the U.S. government to change his statement about EMR weapons science to protect a vital national security secret. A 2010 book by a bioelectromagnetics researcher commented on Koslov's government career, further supporting such a possibility:

[Paul] Tyler and Koslov had devoted their careers to protecting the nation against external threats of every sort--real, potential, and imagined. They would have used any fact that aided in the completion of their mission, and opposed any fact that interfered. Perhaps fine men to follow in matters of war but surely not in matters of science.^[41]

It becomes clear that official government statements about EMR neuroweapons involve national security and can hardly be trusted. By contrast, the science behind EMR neuroweapons--bioelectromagnetics-- is now based on decades of research that, although relatively obscure, is scientifically valid. The science for advanced EMR neuroweapons remains scientifically possible, although unproven and classified. The decades of unclassified neuroscience research suggests that bioelectromagnetics may be a missing neuroscience link for solving how the brain's higher functions work including how the brain processes vision. Furthermore, Rauscher's experiment used magnetic signals beamed remotely without the need for fMRI machines and brain implants that are utilized in cutting edge neuroscience research today. The capability of surreptitious targeting would be another fundamental reason for the importance of bioelectromagnetics to national security.

Most scientists believe that advanced EMR neuroweapons are science fiction, a belief so deeply rooted that recently a group of experts wrote that new rat implant technologies capable of transmitting signals remotely had 'nothing to do with the fantasies of mind control by electromagnetic fields, long a staple of science fiction and lately of conspiracy theory Web sites.'^[42] This belief however, now appears to be based on a lack of key information. For decades, the U.S. government seems to have gone to extreme lengths to keep secret the critical neuroscience behind EMR neuroweapons--bioelectromagnetics. At the same time, as Becker noted, government disinformation tactics were designed to make EMR mind control "absolutely unbelievable." In this way, a science secret has been hidden in plain sight even as classified research may have led to the successful development of advanced EMR neuroweapons. The Rauscher interview is an overlooked and critical part of the unclassified history and science of bioelectromagnetics and EMR neuroweapons. As it has turned out, the neuroscience underneath the "weird and bizarre" government cover stories described by Becker is almost certainly a serious wake up call.

Caption: Deception has been integral to intelligence agencies' communications with outsiders. Don Adams and Barbara Feldon in "Get Smart," the television send-up of spies.

In New York Times, August 14, 1994, The Nation: Let's Play Spy! (And the Money is Real!) by Tim Weiner, Washington.

The covertly created headquarters of the National Reconnaissance Office, the super-secret agency that builds the nation's spy satellites, is turning from puzzle palace into cold war parable. Skeptics snickered last week when the senators charged with overseeing the nation's spies said the agency had hidden its \$347 million budget for a new office complex west of Washington. Congressional oversight of intelligence services is largely an illusory concept," the novelist John le Carré wrote. "If they're good, they fool the outsiders and if they're bad, they fool themselves." So who's fooling whom? . . . Secret spending for spooks was blessed by Congress back in 1949. The Central Intelligence Agency Act said the nation's secret services could spend money "without regard to the provisions of law and regulations relating to the expenditure of public funds." Few in Congress knew what the intelligence services were up to. . . .

[In 1994] In theory, a score of staff members scrutinize tens of billions of dollars spent by tens of thousands of secret servants and help Congress come to consensus with the CIA on the nation's intelligence needs. This has little relation to reality. . . .

Some of the last bitter battles of the cold war are being fought in those closed door sessions. . . .

The brouhaha over the National Reconnaissance Office was not about a piddling few hundred million dollars. It was about civilian control of secret agencies: where the nation's intelligence agencies are headed: how they will get there: who will command them: what justifies the secrecy that protects their power, and who exactly is the enemy now?

Note: For an update on the tremendous growth of government secrecy after 9-11, see the 2011, book *Top Secret American: The Rise of the New American Security State* by Washington Post's Dana Priest and William Arkin. See <http://projects.washingtonpost.com/top-secret-america/>
